TIME OF RECKONING FOR INDIAN TEA

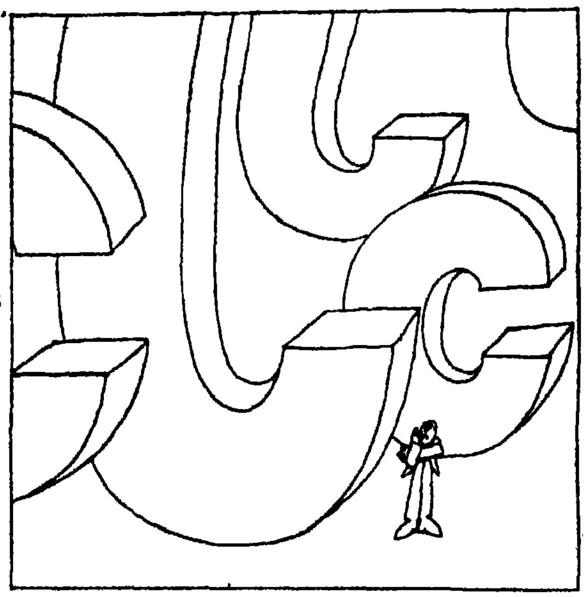
PHILIPPINES: FAMILY RULE UNDER MARTIAL LAW

SERVING GOD AND MAMMON IN TIRUPATI

DEMOCRACY AND MUSLIM EDUCATION

SESSMENT OF FIRST KERALA COMMUNIST MINISTR

It has been clear for some time a computer user could use some help. Help to find his way around in a field that's getting more complex every day. Help in the shape of a specialist service organisation. Like CMC.



SV02

modular concept computers

...s a radical change in ...r thinking the world ... Computer technology ... growing at a phenomenal pace. The new trend is to pick and choose component units from different sources and assemble a computer system to meet specialised needs. The savings and gain in performance is striking by any standards.

The logical sequel: a service organisation for computer users

These new developments obviously call for a total support organisation that can take an overall view, assess a customer's needs, work out ...imum cost-benefit ratios, ...gn interfaces, and assem- modular computer syst-... Today's user demands ...endence, dynamism, ...ility, innovativeness and awareness of contemporary ...logy from any support ...isation. That, in short, ...hy CMC was set up. ...has just one objective: ... the computer user, nothing but.

CMC: the computer user's company

Under the terms of the agreements with computer firms like Cii Honeywell Bull, Robotron and DEC, CMC is in a position to install and commission the latest and most sophisticated systems in the country.

CMC has taken over the maintenance of a variety of computer installations in India, whether they are IBM, ICL or Robotron systems.

As CMC's clients have found out, CMC believes in acting with a minimum of red tape and a maximum of speed and reliability.

With a team of highly qualified engineers and R&D specialists, CMC has some of the finest computer talent in India. Even so, CMC not only runs a continuous series of training courses in India, it sends its engineers abroad to keep abreast of the latest techniques and developments.

Hyderabad: CMC's crucible of R&D

Research is under way on major projects like mixed systems and evaluation of new peripherals. CMC is also developing interfaces to enhance the capabilities of existing systems and is working on the manufacture of indigenous components, tools and test equipment.

What all this amounts to is a determined effort to establish an indigenous base for computer technology in India, and raise the standard of computer know-how, so that India can keep pace with the most advanced trends in computer technology.

The commitment is to the computer user.

THE dilution of their foreign equity holding by foreign companies under the Foreign Exchange Regulation Act (FERA), whatever other good it may or may not have done, has proved a godsend to the fraternity of brokers, underwriters, merchant bankers, etc. According to one estimate, 19 FERA companies made public issues of shares in 1978 and, though nine of them issued their shares at premiums ranging from 20 per cent to 130 per cent, all the issues were oversubscribed many times over.

For all that, a rather obvious conclusion from the experience of share issues by FERA companies does not seem to have been drawn. This is that the small class of people from whom investors in shares are drawn has both the wherewithal and the willingness to subscribe to share issues and that, therefore, there is hardly any case for offering further inducements to persuade it to invest in shares. The trend of investment in other financial assets like bank deposits, deposits of companies, life insurance policies and Unit Trust units also clearly shows that there is no dearth of surplus income with this class. The deposits of all scheduled banks in India multiplied 3.7 times between the end of March 1971 and March 1978, from Rs 6,025 crores to Rs 22,423 crores. Outstanding public deposits with companies are currently estimated at Rs 1,000 crores. Sales of UTI units more than doubled in 1977-78. The Life Insurance Corporation in 1977-78 celebrated its business-in-force crossing the Rs 20,000 crores mark and its annual income the Rs 1,000 crores mark.

What comes in the way of larger investment in shares, in the Indian situation, is really the paucity of corporate investment and certain modes of financing of such investment, most notably the heavy reliance on borrowings from government term-financing institutions, which have evolved over the years. Recognition of this seeps through sometimes in the views of even those who argue for more inducements to evoke larger investment in shares. This was evident at the seminar on the investment market organised by the Indian Merchants' Chamber in Bombay last week. Thus one of the suggestions put forward, and which had the approval of the Controller of Capital Issues who was the chief guest at the seminar, was that established companies should be made to issue shares to the public when they undertake programmes of expansion or diversification. Another suggestion which found a place in the discussion paper prepared for the seminar was that government companies which are doing well should similarly throw open a part of their equity for subscription by the public. Proposals like these, emanating from those who are intimately familiar with the capital market, suggest that the situation is clearly one of an excess of investible resources in relation to available avenues of investment rather than the other way round.

And yet the focus of all discussion on the capital market is invariably on relaxation of government regulations and provision of fiscal and other incentives to attract funds into the market. The seminar referred to above was no exception. Among the suggestions made towards this end was that the present restrictions on lending by commercial banks against the security of shares should be removed. As the discussion paper for the seminar put it, "whatever may be the reason for this policy in the past, the Reserve Bank in consultation with the banks should review this policy and relax its rules, which act as a *constraint* for the capital market". The reason for the imposition of restrictions on bank advances against shares is well known; it was to prevent the sort of hanky-panky in the capital market of which Goenka's doings in Indian Iron shares were the most notorious example. Surely, this reason remains as valid as ever? The capital market must sustain itself not through bank credit, but by mobilising savings, of which in any case there appears to be more than enough with a small class of people.

What is still not recognised, deliberately or otherwise, in discussions of the Indian economy, especially of the private sector of it, is that the problem today is not primarily one of investible resources but of absorbing in investment the resources that *are* available. The reason for this has been quite clearly explained as follows on the very first page of the new Draft Plan: "The pattern of industrial development that has emerged obviously reflects the structure of effective demand, which is determined by the distribution of incomes. An unduly large share of resources is thus absorbed in production which relates directly or indirectly to maintaining or improving the living standards of the higher income groups. The demand of this relatively small class, not only for a few visible items of conspicuous con-

sumption but for the outlay on high quality housing and urban amenities, aviation and superior travel facilities, telephone services, and so on sustains a large part of the existing industrial structure. This means that the further expansion of industry is limited by the narrowness of the market."

So long as these structural constraints on investment and production remain intact, it is futile to expect to see the capital market in full bloom. The real danger is that the measures urged upon the government, and progressively adopted by it, to try and step up investment and production in the very short run will aggravate the basic constraints by further distorting the industrial structure in the direction of goods and services of upper class consumption (for example, following the dismantling of industrial licensing) and by further accentuating the disparities in distribution of incomes and purchasing power (through, for example, reduction in direct and indirect taxes and provision of a variety of subsidies which benefit the urban and rural rich). The measures being advocated supposedly for widening and strengthening the capital market belong to this genre and, as surely as they will be accepted, they will also worsen the disease in the long run.

Nuclear Policy

Arrangement of Convenience

THERE are many aspects about the proposed panel of international scientists to inspect nuclear facilities in India, the US and indeed "throughout the world" which deserve to be noted. According to Indian sources it is supposed to examine only "some general issues regarding nuclear safeguards", and first reports even spoke of it as an "ad hoc committee". The first official confirmation of the proposed panel came in the Prime Minister's remarks during the meeting of the informal consultative committee of parliament on atomic energy, and Morarji Desai was more than usually evasive during the meeting, refusing to disclose the details of the discussions Indian officials had with the US Deputy Under-Secretary of State (who is also the chief US negotiator on nuclear problems) in November last when agreement on the panel was reached. Indeed, on all the five occasions when the Prime Minister has spoken on this subject since the agreement to set up the panel was reached, he has barely been communicative on the topic, once even going to the extent of plaintively asking the inquisitive members of parliament, "Don't you trust me?" or maintaining that any disclosure on his part of what measures government was taking to make 'alternative arrangements" in case the US reneged upon its commitment would only mean inviting further impediments and pressures to frustrate India in its pursuit of its policy of enirely peaceful use of nuclear energy.

Basically, the United States wants to prevent other countries from acquiring advanced nuclear technology and countries like India which have made some progress in that direction from acquiring nuclear weapons. But the problem is that possessing itself a vast nuclear arsenal, it cannot openly disapprove of such plans; nor can it take at their face value mere affirmations made on purely moral grounds, that India will not manufacture nuclear weapons, while at the same time coyly underlining the fact that it possesses the capacity to manufacture them. The problem for India on the other hand is that it would want to have its programme of nuclear research uninterrupted, its facilities closed to inquisitive eyes both domestic and foreign, and its benign affirmations of peaceful aims taken as the whole truth.

The trouble is that neither of these stands is politically viable; hence an elaborate set of rationalisations and face-saving escape routes have to be constructed; and the proposed panel of international scientists on which both India and the United States as well as scientists nominated by the two countries would be represented and which would examine, in theory, nuclear facilities throughout the world, but whose inspection in practice is almost certainly going to be confined to such of the nuclear facilities that India and, perhaps, the US might choose to throw open for inspection, seems just such a device whose aim is to make it possible for the leaders of the US and India to break the impasse to which their public posturings on nuclear policy seem to have led. The US policy of 'discriminatory safeguards' would not in itself have been objectionable to India, but for the fact that not merely the publicly maintained national honour demands that the country should not agree to such discriminatory practices, but the perceived and barely mentioned 'national interests' also make such demands.

In all this, what seems to be the main concern is to save the United States from the embarrassment that it is undoubtedly facing as, once again, and quite possibly under official inspiration, moves are afoot to expose Indian nuclear policy to close public scrutiny. It is to be noted that such close public scrutiny has never been undertaken in India itself, for being all of us patriotic Indians, we do not question what government considers matters of national security.

But national security seems to be very well taken care of. For again and again, government has been affirming that the recommendations of the panel will not be 'binding' on the government; and the agreement to have an international panel to inspect safeguards itself has some built-in 'safe guards' for India in that government spokesmen have been already maintaining that the choice of nuclear facilities to be thrown open to inspection by the international panel has to be entirely India's. As noted in these columns earlier (August 26, 1978), India might allow the panel to inspect one or more of its unguarded nuclear facilities, while keeping its fast breeder reactor programme entirely closed to any kind of inspection.

The Economy

Wooing the 'Kisan'

B M writes:

THERE has been yet another 'inconclusive' discussion on the Janata party's socio-economic programme and its implementation in the party's national executive. But, meeting under the shadow of an imminent split in the party in the wake of the kisan rally and the boycott of the meeting by the Charan Singh faction, the focus of the national executive at once shifted to last-minute desperate moves to avert the split, at least for some more time. As has so often happened in the past, the discussion on socio-economic policies was postponed to another meeting. But George Fernandes still managed to hit the headlines by suitably briefing the press about his remarks at the meeting, which Biju Patnaik also supported, in favour of nationalising the

steel, aluminium and automobile industries.

The suggestion for nationalisation of the steel, aluminium and automobile industries is not a novel one and has been a hobby-horse of Biju Patnaik and George Fernandes for quite some time. But a characteristic quality of this and similar other radical suggestions which George Fernandes and some of his colleagues in the government are fond of making from time to time is that they always surface when the Janata party is passing through one of its by now familiar crisis situations. Such a situation was again at hand and George Fernandes was quick to offer his pet scheme for refurbishing the tarnished "image" of the party. However, such suggestions simply recede into the background when the crisis eases a little and the Industry Minister returns to his strenuous mediatory work within the party. Meanwhile, of course, the so-called captains of industry and trade are in jitters till private assurances are given to them that they should not get so upset about such threats. This is precisely what is now happening all over again.

George Fernandes is concerned with the rapid erosion of public support for and confidence in the Janata Party and its government and is distressed about the 'non-performance' of the government. His criticism is, however, based on the understanding that it is not so much the actual performance of the government as inefficiency in projecting its achievements which is the problem. The Industry Minister is therefore not bothered about any stable perspective of economic and social development. It was thus that he had some papers got ready in his Ministry which make out a case for a bout of nationalisation; these proposals, he brings up from time to time, not as propositions for government decision and action but as talking points for political purposes.

The Industry Minister seems to ignore that competitive populism was something introduced into political management by Indira Gandhi many years ago. He also does not seem to realise that the nationalisation slogan has been so much overused that its fascination for his own partymen has very much dimmed. He, therefore, fails to carry conviction within his own party, let alone impress other political formations.

So others pick up the thread where George Fernandes leaves it. The success of Charan Singh's kisan rally would appear to have impressed not only the factions in the ruling party with which Charan Singh is at loggerheads but other political parties also. An instance is the CPI(M)'s assessment of the rally and its reluctant recognition that Charan Singh could no longer be dubbed merely as a reactionary kulak leader but has to be reckoned with as a mass leader of the peasantry.

The forceful plea made by the Minister of State for Agriculture, Bhanu Pratap Singh, at the meeting of the Janata's national executive for winding up the Agricultural Prices Commission and setting up a new body to administer arrangements for ensuring 'parity' between agricultural prices and prices of agricultural inputs and other manufactures was in this context more significant than George Fernandes' call for nationalisation of certain industries. Pressures within the Janata Party for subsidisation of commercial agriculture on a large scale may be expected to gather force in the coming weeks and will have a considerable impact on official policies. The subsidy for sugarcane prices which many state governments have announced on the plea that the farmers must be assured last year's market prices and not just the minimum support prices fixed by the Union government for this year gives but an inkling of the situation that is emerging as political parties and factions try to outbid one other in wooing the 'kisan'.

Cement

Of Priorities and Profits

THE statement to shareholders by P S Mistry, chairman of ACC, should serve as a good indicator of the optimism in the cement industry. For ACC is the leading, single largest manufacturer of cement in the country. Its installed capacity of 7.1 mn tonnes is to be expanded over the next three years by another 2 mn tonnes at a cost of Rs 150 crores through setting up one new plant of 1 mn tonnes and expanding three existing plants. Mistry acknowledges that the government is taking positive steps to increase production capacity so that the shortage of 2.4 mn tonnes per year, which he attributes to earlier official policies on cement, can be overcome.

One such 'positive' step, no doubt, is the prescription of a 12 per cent post-tax return on net worth for new units. As its chairman points out, six of ACC's 17 units are less than 25 years old and account for 42 per cent of the company's capacity. ACC would thus benefit from such a stipulation. However, according to ACC's chairman, the extension of that rate of return to the older units too is 'imperative'. Not merely that; all cost escalations which are outside the company's control, he opines, should be compensated by price increases. Such cost escalations — apart from the grey area of 'inventory control, and 'productivity increases' which must remain unassessable territories — range from power tariffs and excise duties on power and coal, to wage increases. P S Mistry would like cost increases to be neutralised every quarter. He appreciates, however, that since the Tariff Commission's coverage is to be over in March this year, government has briskly appointed a high-powered commission (headed by the chairman of the Bureau of Industrial Costs and Prices) to look into costs and pricing so as to help the growth of the industry. Since "pricing", according to Mistry, "plays an all-important role in determining whether production is accelerated or stifled", ACC now expects a higher price stipulation from the government as a precondition of growth.

But that is not all. ACC's chairman would like government to strengthen the infrastructure so necessary to the growth and sustenance of industry. Indeed, ACC's performance, it is pointed out, might have been even better last year (when production, sales and ploughback were in any case higher than in the previous year) but for 'external constraints' such as of wagons, coal, and power supplies.

If anything, ACC's view of the cement industry's growth and the government's necessary role in it reflects yet again the lack of competition within the industry given the overall cement shortage and the industry's heavy dependence on the government for finance, cost increase neutralisation, and crucial infrastructure. Clearly, apart from the constraints of an inadequate infrastructure, industry has much to be satisfied with the Janata government. Not only has the post-tax return on net worth been stepped up for a major part of the industry, but restrictions on 'large' business houses have been whittled down to allow investments in cement. Recently, five new major business interests have got clearance for setting up cement capacity, even as J K Synthetics and ACC have been allowed expansion. As for the mini-cement plants, the definition of 'mini' in terms of capacity

...day which has also been stepped up, together with the long list of special incentives (ranging from slashed excise duty, to easy import of technology and equipment), should help existing business interests to enter the minis with great profit.

Since, in a situation of shortage and consequent black market, cement carries a premium — public distribution notwithstanding — a dual pricing system may be a welcome relief all round. This should make it possible for the priority sectors and projects to get cement at a controlled price, whereas cement manufacturers may be left free to reap profits for their 'ploughback' in the non-priority consumption areas such as sophisticated housing and office buildings where they may charge the price this market can bear.

Iran

Decline and Fall

NOTHING illustrates the collapse of the whole edifice that the Shah had built over the last 25 years than the way in which the economic boom for which Iran had become famous since the massive inflow of oil money has so suddenly turned out to be a mere bubble. For almost a year now, Iran has been virtually without a government; and with the masses responding to every call by the exiled religious leader, Ayotollah Khomeini, and with workers in banking, shipping, transport and communication services, and above all, in the oil refineries almost continuously on strike, the whole money economy seems to have collapsed. The collapse of the system is most dramatically seen in the continued fall in oil production: from an average daily production of over 5 million barrels per day, it sharply came down in the course of a few weeks to less than half a million barrels a day till it finally stopped towards end of December, with the refineries themselves shut down. The chairman of the National Iranian Oil Company, according to one report, has been ready to concede any wage demand of the oil workers, but the strikers have maintained that the stoppage would continue until the Shah quits. Thus, the regime which sought to project itself as the guardian of stability in a wide arc of territory stretching across west, south and south-east Asia on the basis of its economic strength by virtue of being the world's second biggest exporter of petroleum has had to take recourse to import of oil, and its closest neighbours and major oil producers have refused to sell it oil.

With the oil industry grinding to a halt, with many of the banks burnt down and with the prospect of bankruptcies and closure staring many of the remaining in the face, with sections of the armed forces in revolt, with many of the multinationals which had fattened on the 'boom' now scurrying away like rats leaving a sinking ship, with imperial family itself leading the flight and with the Shah too agreeing to go on a 'holiday' abroad, with the various politicians who after being persuaded by the Shah to form 'civilian' administrations being promptly disowned by the opposition national front, what is the way out for the Shah and, more importantly, those powers that are backing him? For, it should be obvious that despite his imperial pretensions, Reza Khan was important only to the extent that he willingly conspired with Britain and the United States in overthrowing the democratically elected regime of Mohammed Mossadegh in 1953 and making Iran safe for western oil interests, and even the leading role he took in organising the oil cartel in 1973 was forgiven because the western countries which cried the loudest that they were being screwed by OPEC knew how to take care of themselves — witness the systematic way in which the increased oil wealth has only spurred on various kinds of adventurers to make more money by participating in 'development' projects in these countries. The Shah could have continued to be acceptable had he only been able to stem the rising revolt, and the US administration, so deeply committed to 'human rights', has repeatedly affirmed its full support to the Shah. But even the Americans seem to have been convinced that the Shah's usefulness is now exhausted, and hence the search is on for a successor.

What the US most desires in Iran, as in other regions of West Asia, is stability, the continuation of the presently satisfactory set up. With Egypt successfully alienated from the majority of Arab states but with the most important of the Arab states, Saudi Arabia, as well as many of the oil producing sheikhdoms also under firmly pro-American regimes, with Israel on the verge of securing legitimacy thus ensuring the permanent presence of a virtual extension of the US in the area, the US had reason enough to be satisfied with its foreign policy in West Asia. The need, therefore, is to ensure a quick return to 'normalcy', and if in the process it is necessary to sacrifice the Shah, it should not cause much concern, for this would not be the first time that the US would have helped in the overthrow of a puppet they themselves had set up. According to reports appearing in the American press, the US is in fact engaged in such an exercise; for a state department spokesman, Hodding Carter, was reported to have said in Washington on December 14 that the US was currently engaged in increasing its consular and political staff in its embassy in Teheran, and the main task of this additional staff, selected for its knowledge of Farsi, was to "broaden the political contacts of US diplomats in Teheran".

This broadening of the contacts of US diplomats in Teheran has naturally coincided with the search for a civilian government to succeed the Azheri regime. The first of the chosen successors, Gholam Hussein Sadiqui, deliberated for a few days, but could never quite overcome the problem posed by "a shortage of relatively young men who have political experience but are untarnished by association with previous unpopular administrations". Now, another successor has been chosen in the person of Shapour Baktiar, a deputy minister in the government of Mohammad Mossadegh; but he seems to be having had as little success as Sadiqui.

But whatever be the solution found and whichever be the regime that will take over, the more fundamental issues raised during the current uprising in Iran will remain. The paradox of the current struggle in Iran is that it is being led by that very class which has apparently benefited greatly from the moves towards 'modernisation' initiated by the Shah; and the effervescent quality of this 'modernisation' too has been most vividly demonstrated in the almost total collapse of all of its symbols at the first instance of internal crisis. This paradox cannot be resolved by a mere substitution of one regime by another which at a superficial level might pursue marginally different domestic and foreign policies, but which in its frenetic demands for a restoration of 'Islamic' values might also want to go back to a period of imagined innocence and purity. Anyway, the kind of forces that have been released during the present struggle can never be contained within the limits of an 'Islamic' order.

[illegible]

THE contents of the article "Open-Sesame for Foreign Banks and MNCs?" by your Special Correspondent (November 18, 1978) seem to be entirely one-sided, if not, on certain issues, presenting the position in an altogether wrong perspective.

To consider the foreign exchange dealings and market in their proper perspective, one has to keep in mind the extraordinarily rapid growth of India's foreign trade in recent years and its importance to the Indian economy. As is well known, many of the bilateral trading arrangements have recently been converted to trading in free foreign exchange, the Soviet Union being a major exception. Given the two-way trade figure of say Rs 11 000 crores in the current year and the anticipated growth in the foreign trade, one can well visualise a two-way trade level of the order of Rs 15/20,000 crores per annum, in free foreign exchange, in the next few years. The adequacy of the foreign exchange dealings and market in India has to be viewed in the context of their ability to service efficiently this volume of foreign trade which, after all, represents perhaps as much as 20 per cent of the country's GNP. It is this extremely important segment of the economy that the foreign exchange market has to service by offering competitive rates.

It would be worthwhile in this connection to examine the extent to which competitive rates are available to importers and exporters in India, as compared to their counterparts abroad. While obviously even in other markets foreign exchange rates differ from customer to customer and also upon the size of the transaction, the basic requirement for competitive rates is a strong and efficient local interbank market. In the London market, for example, the selling and buying rates for US dollars in the interbank market rarely differ by more than 10 points. In other words, the spread between buying and selling rates of the major international banks is as low as 0.05 per cent. The customer rates would obviously have slightly wider margins. These spreads which represent the profit margins of the dealing banks compare with a spread of 1.04 per cent between the clean T/T buying and selling rates for Sterling quoted by Indian banks. For documentary transactions, which are of greater interest to importers and exporters, the basic spread in T/T rates is as much as 1.3 per cent. The spreads for quotations in currencies other than sterling, are generally wider as there is no buyer *and* seller of last resort available locally.

Looked at in this background, the development of an efficient interbank market in India is a must for growth of foreign trade. And, development of an efficient market ultimately depends on growth of dealing expertise, communications, efficient brokering services and competition. The change that the Reserve Bank has made in the latest edition of the exchange control manual to the effect that positions need be square or near-square and reasonably matched *at the end of the day* (the earlier manual required square positions to be maintained at all times, a proviso very difficult, if not impossible, for banks to implement and RBI to monitor) is indeed an extremely welcome measure for the growth of dealing expertise and through it an efficient foreign exchange market in India. If, as it certainly is, an efficient market is absolutely essential for enabling the banks to quote better rates to customers, which again is a major need for the growth of the country's foreign trade, the recent steps can hardly be considered in the light in which your Special Correspondent has viewed them. It needs to be emphasised that exchange trading operations alone can build up an efficient exchange market and help the growth of foreign trade. Viewed in this context, they can hardly be considered unproductive. Your Special Correspondent is also mistaken in claiming that only now "contrary to earlier regulations in this respect, banks in India who are authorised to deal in foreign exchange (ADs) are permitted to freely buy and sell, both spot and forward, foreign exchange from/to other ADs and overseas markets". In fact, there is no material change in the regulations in the old manual and the new as far as this particular issue is cocerned. In the old manual the only restriction on interbank sales and purchases was that these operations should not result in accumulation of balances in the banks' accounts abroad, in [illegible] date needs. As for dealing in other permitted currencies in markets abroad, this was permitted for cover of merchant transactions *and also for adjustment of the authorised dealers' own position* (interested readers may like to refer to section V of the old manual). The covering with Reserve Bank alone was restricted to merchant business. The position continues to hold good even in terms of the revised manual.

Your Special Correspondent has criticised the permission to borrow abroad for replenishment of rupee resources, as if this is something altogether new. Presumably, his criticism relates to paragraph 8.16 of the 1978 edition. This particular provision has, for all practical purposes, been bodily lifted from section XXVII of the old manual. Therefore, if the proviso is to have all the disastrous results your Correspondent apprehends, these should have been occurring for the last several years. The fact that the provision has been continued is perhaps indicative of its nonuse, or at least nonmisuse. The blanket nature of the permission is vitiated to a large degree by the proviso that repayment would "be subject to the Reserve Bank's consent which, in turn, would be available only if on the repayment date there are no borrowings in the interbank market or from the Reserve Bank. Your Correspondent has rightly emphasised " the amomalies this can lead to.

What can be questioned is the continuation of the provision in today's circumstances. If the idea is to encourage foreign borrowings to replenish rupee resources, the purpose is not served because of the anomalies. If on the other hand, foreign borrowings for this purpoee are to be discouraged the permission should be deleted.

Coming back to exchange dealings, a general distrust of all enterprise seems to be the accepted order of the day. Surely it is unnecessary to extend it to public sector banks who, after all control perhaps 90 per cent of the Indian foreign exchange market. Indeed the modest relaxations aimed at growth of dealing expertise and enterprise, and hence a more efficient exchange market in India, should be welcome to everybody interested in the growth of the country's foreign trade.

A V Rajwade

Bombay

December 12, 1978

THE article "Open Sesame for Foreign Banks and MNCs?" alleges that the Reserve Bank of India (RBI) is on a "liberalisation spree" and that it is experimenting with the development of an exchange market, which would effectively link itself with the international market, in the manner of the Singapore, Hong Kong and Bahrain markets. A foundation for the creation of such a market is said to have been laid by the liberalisation of foreign exchange regulations.

A sweeping statement has been made that the recent currency gyrations are due to the trading activities of MNCs, aided and abetted by the Central Banks of countries, which have limited scope for raising their national income through production of real goods and services. Further, the new regulations as set out in the 1978 edition of the Exchange Control Manual will, it is suspected, facilitate the speculative operations of Indian branches of foreign banks and also some banks of Indian origin, which have hitherto indulged in foreign exchange trading activities on the sly. To illustrate his point, the Correspondent points out that Authorised Dealers (ADs) have been permitted to enter into free foreign exchange transactions (both purchase and sale, spot and forward) with other Authorised Dealers and overseas markets, and the prior sanction of RBI to enter into foreign exchange transactions abroad has been waived.

Authorised Dealers, then and now, are required to maintain square or near-square position, in each currency, after taking into account all their purchases and sales, spot and forward, at the close of business each day; maturities of various transaction-entering positions have also to be reasonably matched. To reach square or near square position, Authorised Dealers may adjust their overbought/oversold positions by sales/purchases in India (inter-bank deals) and overseas exchange markets or by swap operations, as regulated by the RBI. In all transactions with overseas branches or correspondents, Authorised Dealers must maintain balances commensurate with genuine requirements; they are also directed not to encourage accumulation of balances in excess of their immediate needs in such accounts abroad. If any liberalisation has been made in the new regulations, it is only in respect of maintaining square or near-square position at the close of business each day and not at every point of time. Control of overnight open positions has thus been retained.

Even in the 1978 edition of the Exchange Control Manual (ECM) where ADs have been permitted to freely correct imbalances in their positions, they have been enjoined to avoid as far as possible outright forward or swap transactions which might create unreasonably matched securities at the close of business on any day. Again ADs are permitted to buy/sell for spot as well as forward deliveries from the External group of countries alone, only on exhausting the possibility of buying/selling in the interbank market itself.

The most important directive, which has been retained in the Seventh edition of ECM, is that purchase and sale of foreign currencies by ADs with overseas banks as well as their own branches abroad should be made to cover genuine transactions with non-bank customers in India or for adjusting their own position in any particular currency, at the same time taking care not to incur an unreasonably open position in any currency or unreasonably mismatched maturities. Even in case of difficulties encountered by ADs in securing cover transactions abroad, a maximum period of only five days is given to rectify the position.

The regulation for repayment has also been attacked. The Correspondent feels that the RBI sanction which is conditional prior to repayment, which in any case will be permitted only if there are no outstanding borrowings from RBI and the interbank market, makes strange reading. As a corollary, he draws the conclusion that significantly it is the Indian branches of the multinational banks who generally have no borrowings from RBI — the direct result of their high liquidity — and who will therefore be privileged to borrow from abroad. This 'benefit' will then trickle down to the customers of these banks, to whom the banks may pass on the advantage of low interest rates secured on their borrowings abroad. This is a gross misinterpretation or a partial interpretation of the manual provision. For it has been stated specifically that ADs (including Indian branches of foreign banks) may avail of credit facilities from their overseas branches and correspondents upto a maximum extent of Rs 20 lakhs. This ceiling is the total of all borrowings of all branches of the AD in India from all overseas branches or banks abroad. The counterpart funds thus created by banks have also to be used for financing normal banking operations and not for investing in call markets, etc. As the watchdog of the nation's foreign exchange resources close monitoring of ADs' transactions abroad is done by the RBI by frequent inspection of accounts. Weekly returns of the ADs' positions are scrutinised, and any transaction abroad not covering a genuine merchant transaction is immediately closed on finding. The allegations that banks that sell borrowed foreign currencies to raise rupee counterpart funds will also buy an equivalent amount to avoid risks and thereby gain endless opportunities to operate in overseas exchange markets is without basis. The standing rule has been that every purchase/sale, spot/forward has to be at least nearly covered, which means that at all times ADs have had foreign currency liabilities outstanding in the books. Endless opportunities to intervene in exchange markets has always existed, and ADs could indulge in trading activities, cutting a large slice of profits for themselves. In no way has RBI gone out of its way to legitimise or legalise such trading activities.

The correspondent also writes of the implications in terms of exchange risks if banks should participate in pure exchange trading, as distinct from genuine merchant transactions. Though the possibility of ADs indulging in speculative activities cannot be totally ruled out, they have not been licensed to do so in the new exchange control regulations nor are they ready to do so. By and large, they have been conservative in their dealings, operating in the inter-bank market in India, but depending mainly on the foreign exchange markets for their requirements. The new regulations do not authorise speculation in markets abroad, but do permit it in the inter-bank markets, i e, purchase and sale need not necessarily cover genuine merchant deals alone. This is specifically allowed to encourage an active inter-bank market for foreign exchange. This does not involve any foreign exchange losses and, therefore, will have no repercussions on the economy as a whole. The introduction to the chapter on Inter-bank Dealings says that the objective behind these regulations is to sustain an active inter-bank exchange market in India in various permitted currencies both for spot as well as forward transactions so as to reduce as much as possible dependence of Authorised Dealers on overseas foreign exchange mar-

[illegible] ments. Against this background, the question whether the government as the owner of public sector banks will underwrite possible losses from such pure trading transactions does not arise at all, let alone the justification for assumption of such a responsibility.

Another question that has been raised is whether all the ADs, now numbering 58, should be allowed to engage in trading operations. That the agencies permitted to deal in foreign currencies are called Authorised Dealers is sufficient pointer that they were authorised, on the basis of the volume of business and their performance, to deal in foreign exchange. There can therefore be no further discrimination on any basis now.

A fear has been expressed that the rationale for permitting overseas borrowings to replenish rupee resources is undesirable and will make a mockery of the credit control policy; and that in future banks will feel no real compulsion to make vigorous deposit mobilisation efforts, since they can secure cheaper funds from abroad. In all walks of life, misuse of powers is an occupational hazard which has to be put up with, within reasonable limits. The seventh edition of the ECM is merely a refinement over the previous one, a streamlined product, injecting a measure of flexibility in ADs' operative powers in view of the longer term of forward facilities to exporters now given. It must also be remembered that RBI itself does not deal in all currencies (it deals only in the pound sterling, US dollar, deutsche mark and yen) and for purchase or sale ADs must approach overseas markets.

III

THE article "Open Sesame for Foreign Banks and MNCs?" by a Special Correspondent dwells on three aspects of the Exchange Control Regulations (as incorporated in the latest edition of the Exchange Control Manual), *viz*, (1) the freedom granted to banks in India authorised to deal in foreign exchange (ADs) to buy and sell, both spot and forward, foreign exchange from and to other ADs, (2) the regulation permitting ADs to borrow foreign currencies from their overseas branches and correspondents to replenish rupee resources for financing their normal business operations in India, and (3) the regulation requiring ADs to maintain square or near-square position in foreign currencies at the end of the business day instead of at every point of time. The article contains [illegible] inaccuracies about these aspects which I would like to correct.

The permission given to ADs to buy and sell foreign exchange freely from/to other ADs and to buy and sell foreign exchange in overseas markets subject to certain pre-requisites is not new or contrary to earlier regulations as mentioned by the Correspondent. The 1971 edition of the Exchange Control Manual contained more or less similar regulations.

Likewise, the permission given to banks to borrow foreign currencies from overseas branches and correspondents to replenish their rupee resources for financing normal domestic business operations is not new as is made out by the Correspondent. It has been in existence since 1965. The relevant paragraph (8.16) in the latest edition of the Manual is almost a reproduction of paragraph 2(iii)/Section XXVII of the 1971 edition. The facility is being used sparingly by foreign banks in India for meeting temporary shortfalls in resources. It is not true that the Indian branches of multinational banks have generally no borrowings from inter-bank or the Reserve Bank.

The statement by the Correspondent on the regulation requiring authorised dealers to maintain square or near-square position in foreign currencies at the close of business each day instead of at all times also needs to be clarified. This is the only change incorporated in the new edition of the Manual. It is intended chiefly to activate the inter-bank markets so that non-bank customer transactions can be matched as far as possible within India. The change was effected because, due to the continuous inflow of non-bank customer business through the trading departments in banks, it was not always possible for authorised dealers to maintain near-square position at all times. Moreover, this benefits the country by avoiding foreign exchange expenditure towards bank charges, cables etc. B RANGASWAMY

Press Relations Officer,
Reserve Bank of India,
Bombay.

IV

Our Special Correspondent replies:

THOUGH under the earlier Exchange Control Manual, the ADs were free to buy and sell or swap in the inter-bank market or overseas markets, such transactions were permitted only as cover for their oversold or sold position or adjustment of fund and maturity positions, all resulting from non-bank transactions. On the other hand, the new Manual permits the ADs to buy and sell freely in the inter-bank market and such transactions need not necessarily be related to their positions arising from non-bank transactions. Similar transactions with overseas markets are also permitted subject to restrictions on balances and forward transactions against the rupee.

The relaxation of the restrictions relating to maintenance of square or near-square position at all times (as against the square or near-square position at the end of the day as stipulated in the new Manual) will not help in achieving the desired objective of encouraging the growth of the inter-bank market. It may even have adverse effects on the inter-bank market growth as some ADs may accumulate their currency positions during the day in order to effect the cover in the overseas markets.

As regards the suggestion by A V Rajwade that the modest relaxations aimed at growth of dealing expertise and enterprise and hence a more efficient exchange market in India should be welcome to everybody and that there is no need to extend the general mistrust of enterprise to the public sector banks, one may be pardoned for raising a simple query. If this is so, why complain about the wide spread between the buying and selling rates charged by the public sector banks, as they are not likely to do anything against the public interest?

The permission accorded to the banks for borrowing foreign currencies to raise rupee resources, when viewed in the context of the greater, though modest, freedom to trade in currencies, has created a fairy different environment of banking business than the earlier situation. Besides, it is only less than two years ago that the ADs were discouraged to rediscount bills in overseas markets on account of the comfortable foreign exchange position of the country and the unnecessary costs of interest outgo. There appears some incompatibility in the two sets of rules.

The Third Alternative

Romesh Thapar

WE are all wondering what new dimensions the Janata Party crisis will develop in the coming weeks. Indira Gandhi's "punishment" did not spark the "rebellion" that was expected by her hysterical followers; even the so-called "jail-going" was indulged in because it was to be of a few days' duration. Charan Singh's over-publicised kisan rally in the Capital also passed without incident — and despite the extraordinary police *bandobast* ordered by Morarji Desai in the Home Ministry. But the political pot has to be kept boiling.

If the Prime Minister is reminded about the overdue Cabinet reshuffle by the resignation of L K Advani (conveniently withdrawn as all resignations are *these days!*), Indira Gandhi talks in terms not easily understood by law-abiding citizens (even the hijackers are pardoned!), and Charan Singh's BLD advisers make it known that they are prepared for a honeymoon with the Congress(I) (after all, a bouquet was sent to him on his birthday!). Something is in the offing.

This kind of political free-wheeling creates all manner of diversions, like the Kanti Desai enquiry, in an effort to create confusion over the central issue. This remains the Janata Party's coherence around a central leadership. At present, despite the inevitable dividends from a posture of toughness, Morarji Desai is singled out for removal. Incongruous, isn't it, when he is busy planning the re-shuffle of his Cabinet? The contradictions within the situation are many. A Charan Singh defection at this point could de-stabilise the governments in Uttar Pradesh, Bihar and Harayana — something which was not possible at the time of his resignation from the Union Cabinet. But a split BLD would perish on its own. It has to seek allies. That's how the notion of a "federal party" arises — and it would lessen the shock of an embrace with the Congress(I) within the Jat heartlands! However, it's doubtful that these opportunist political manoeuvrings could uncover serious and meaningful coalition initiatives for a new structure of power at the Centre.

Indira Gandhi, due to lose her "majority" in the Rajya Sabha within a few months on the basis of new elections, can only make her presence felt by an open espousal of street politics. But this goondaism, she knows, will cost her many middle class votes in the towns. In fact, it may well put the lid on her hopes of "a comeback" — yes, even in South India. She doesn't quite know how to keep the agitation within certain bounds of discipline when the rowdies mobilised by son Sanjay really call the shots, and she is carried by the momentum.

Morarji Desai, still speaking rather impressively, fails to respond to the challenges. He is too old, too fixed in his ideas, and too rigid in dealing with people. He is unable even though he heads a Janata Party regime, to appreciate how his son Kanti appears to politicians and the public after the Sanjay episode. The real trouble is that the political environment has changed considerably, but the key actors are the same, and unchanged. India's trauma lies in these simple facts, because there is really no massive movement of opinion to shake the system to its foundations — only racketeering bank and insurance clerks (also officers!) on strike,. the labour aristocracy clamouring for more and more under revolutionary leadership.

Interestingly, the CPI(M) is beginning to feel its own inadequacies as the hunt begins for "a third alternative". E M S Namboodiripad has drawn intelligent attention to this need and the prevailing vacuum. He is compelled to tell his party to see itself in such a role. There is even talk of moving into the Hindi heartlands now being mismanaged by the corrupt politicians of the Janata and Congress parties. Many a Janata and Congress spine will quiver at the prospect, even though the CPI(M) has a veritable forest of problems to settle with its CPI 'comrades' before it can even think of presenting itself as an alternative formation leader. In other words, Kerala beckons for a practical demonstration of intent.

Whatever the demoralised and gloomy pundits might say, India is moving politically. For the first time it is possible to say that decisive segments of the population are looking for an alternative to Janata factionalism and Congress goondaism. Hired demonstrators, whether middle class boys playing at hoodlums or kisans hoping that someone will speak for them, influence the situation marginally. Only organised people, committed to a programme which makes sense (and unlike the nonsense of Charan Singh's twenty-points!), can alter the system which holds us trapped. This is the alternative. And the CPI(M) has to surmount its biggest obstacle: a lack of serious commitment to democratic functioning in the sense non-communists understand the business.

Before an alternative can even begin to take shape, a sustained debate will have to develop among those who are anchored to a democratic conscience and who, at the same time, realise that it is worthless without commitments to the battle against abject poverty, glaring inequalities, communal hatreds and caste discriminations. They belong to all parties. They have to be mobilised on a continental scale.

Of course, as I said, we don't really know what dimensions will develop. After all, at this crucial juncture in our affairs, Acharya Vinoba Bhave has declared that he intends an indefinite fast unless cow slaughter is banned!

December 30

Losses Carried Forward

Hansavivek

PREMIER AUTOMOBILES is exploring possibilities of production of a new model of car incorporating the latest technological improvements including optimum fuel economy. It is also attempting to produce a diesel engine car. Meanwhile, it is experimenting to improve fuel economy on the existing cars by design changes in the engine as well as use of higher octane fuel. With demand for both passenger cars and commercial vehicles having improved considerably, the company stepped up and maintained the higher production till November last when labour unrest erupted at all its three factories and brought down output sharply. According to the management, inter-union rivarly has been responsible for the labour trouble. During the major part of the year ended June 1978, the company's operations were adversely affected by uncertainty in supplies from the ancillary industry arising out of labour problems at the suppliers' end. In the beginning of that year, there were serious problems in getting supplies of vital components, such as brakes, electrical items, etc, from several ancillary units situated in southern India. Supply of essential components from certain ancillary units situated in northern India was also adversely affected. Government allowed liberal imports of required components, but it was not possible to locate all the required components in overseas markets. Besides, the landed cost of the components was very high. The company also experienced prolonged labour unrest at its Dombivli plant. There was a slow-down in production for more than two months which eventually culminated in the lock-out/suspension of work at all the plants for more than 3½ months.

During the year, the company produced 12,222 numbers of cars and sold 12,126 numbers, as against 17,530 numbers and 17,541 numbers, respectively, produced and sold in the previous year. Similarly, output and sale of commercial vehicles declined from 2,270 and 2,403 numbers to 926 and 958 numbers, respectively. Production of drive-away chassis, however, increased from 24 units to 147 units and their sale was up from 89 units to 143 units. Exports increased to Rs 62 lakhs from the previous year's Rs 39 lakhs. There has been a good demand for commercial vehicles in countries like Mauritius, Bahrain, Bangladesh, etc. The management expects further increase in exports this year. But the outcome of the year's trading was a loss of Rs 1.19 crores as against a gross profit of Rs 52 lakhs in the previous year. The loss has been reduced to Rs 18 lakhs by utilising last year's surplus (Rs 35 lakhs), a write-back from general reserve (Rs 53 lakhs), and from development rebate reserve (Rs 13 lakhs). After providing Rs 9 lakhs for investment allowance and making other adjustments, the resultant loss of Rs 30 lakhs has been carried to the balance sheet. Again, no amount has been provided for depreciation; arrears on this account have mounted up to Rs 6.28 crores.

[illegible] Hirachand, chairman, says the [illegible] car industry is highly employment-oriented and should be accorded due priority so that it can plan for its future growth with confidence.

INDIAN HUME PIPE has received a number of fresh orders. Notable among them are: for 12 km of hume steel pipeline for the town water supply scheme of Surat, for hume steel pipeline for GSFC work at Baroda for about 7 km, for penstocks for Bassi augmentation scheme of the Himachal Pradesh State Electricity Board, and for penstocks for the Pench Valley hydro electric project in Maharashtra. Meanwhile, the company has completed deliveries of the third instalment against the 5-year contract for the supply of pre-stressed concrete railway sleepers received from Indian railways in January 1974. The company still faces some difficulty in getting regular supply of special cement required for the manufacture of sleepers. Other manufacturers of cement are not coming forward to manufacture this special cement, because the requirement of this cement is small and they feel that they may not be able to produce it at economical price. During the year ended June last, IHP showed a lower gross profit of Rs 1.32 crores against Rs 1.41 crores in the previous year following decline in sales and work bills from Rs 13.27 crores to Rs 11.38 crores. Net profit is also lower at Rs 44 lakhs (Rs 50 lakhs). The unchanged equity dividend of 12.8 per cent is slightly short-earned, as against a cover of 2.11 times shown in the previous year. There has been some labour unrest at the Badarpur and Wadala factories of the company. While the dispute at Badarpur has been amicably settled, the Wadala factory has been facing slow-down of work and sit-down strike for some time past, causing sizeable disruption in working and heavy losses.

GARWARE PAINTS, formerly Blundell Eomite Paints, has experienced contraction of margins during 1977-78 as reflected in an almost unchanged gross profit, despite higher sales. Profit after tax, however, has turned out to be better than last year's owing to reduced tax liability. Consequently, dividend raised by a point to 15 per cent is covered 2.3 times compared to 1.92 times previously. The directors explain that turnover would have been still better, but for the labour unrest for a period. Besides, profit margins were squeezed between rising prices of raw materials and containers and substantial increases in excise duty rates, even as increased costs could not be absorbed in selling prices in the face of stiff competition in the market. The employees at the factory had resorted to 'go slow' and 'work to rule' agitation and the management declared a lock-out which remained in force for 12 days. An agreement has been reached with the employees' union in regard to their charter of demands and it is hoped that good industrial relations will continue hereafter.

SHRIRAM BEARINGS has shown improved results for the year ended June 1978, with a gross profit of Rs 17 lakhs against a trading loss of Rs 2 lakhs in the previous year following higher sales of Rs 4.39 crores against Rs 3.40 crores. After providing for depreciation, there is a net profit of Rs one lakh compared to the previous year's net loss of Rs 18 lakhs. The directors have recommended payment of arrears of preference dividend for 1976-77. For this purpose, Rs 67,985 has been transferred back from the general reserve. These results have followed increase in production of ball bearings, from 13.68 lakh numbers to 17.37 lakh numbers, coupled with better realisation on sales. Operations during the current year were also better upto September last, when the company achieved a monthly production of 1.80 lakh bearings. But working was disrupted by a strike which has been declared illegal by the government of Bihar. Efforts are going on to resume operations with the help of the state government. Meanwhile, steps have been taken to balance the plant capacity for further improvement of [illegible]. A loan of Rs [illegible] has been sanctioned by ICICI for this purpose and orders for the machines have already been placed. Balancing equipment is expected to be installed and commissioned in the current financial year. Technical collaboration with INA of West Germany became effective during the year, and the company is going ahead with expansion of ball bearings capacity at Ranchi by 1.9 million numbers. Progress has been made also under the letter of intent for manufacture of plant protection chemicals. Steps for registration with Central Insecticides Board of the pesticides proposed to be manufactured have been initiated and necessary agreements with CSIR laboratories and consultancy organisations are at an advanced stage of finalisation.

CARBON CORPORATION has turned out satisfactory results for the year ended June 1978, the first year of production, when it marketed 1,904 tonnes of graphite electrodes valued at Rs 3.07 crores. The performance would have been better, but for the delay in delivery of some critical equipment which prevented full utilisation of the built-in capacity. Demand for electrodes has increased with the rising trend of output of mini-steel plants. Till mid-December last, the company sold 1,637 tonnes valued at Rs 2.67 crores. Production, however, has been lower than expected because of a shortfall in the receipt of baked blanks from collaborator, Graphite India, due to strike and flood situation at one of its plants.

TEA INDUSTRY

Time of Reckoning

AT a recent meeting with the Deputy Governor of the Reserve Bank of India, K S Krishnaswamy, and other senior officials of the banking establishment in Calcutta, representatives of the tea industry made an eloquent plea for special sanction of funds by banks to it on easy terms. The thrust of the industry's argument was that the boom that the industry had been enjoying since 1974 was now showing definite signs of petering out, as was reflected in the working results for 1978 which were far from happy.

Another point that the industry brought up was that the norms of bank financing for tea companies had virtually remained unchanged since the early 1970s when the guidelines were adopted on the basis of the B K Dutt committee on tea finance. Rules governing overdraft limits and margin requirements being followed since then had become dated and needed revision.

Still another contention made by the industry was that tea companies were practically having the worst of both worlds. They were being treated as engaged in an agricultural activity and were thus subjected to heavy doses of agricultural income tax. Simultaneously, the companies were being subjected to the usual heavy rates of corporate income tax. At a time when most of the companies were being forced to think of plans for replanting and in-filling and extension, they needed funds on easy terms as their own reserves were inadequate for such purposes, it was observed.

The bankers are believed to have pointed out that there appeared to be a case for reviewing the norms of bank finance relating to overdraft limits and such other issues because they needed to be changed. At the same time, they did not hold out much assurance that the tea industry could be treated preferentially compared to others in matters like rates of interest or repayment terms. A leading banker pointedly mentioned that the interest burden constituted but only a small proportion of a tea company's costs and when it was coping with other cost rises, it should not mind paying a little more interest charge either.

Thhe fact of the matter, viewed in a slightly differet way is that the industry is having, not the worst, but the best of both worlds. It is enjoying all the facilities accorded to an agricultural creditor and at the same time it is taking full advantage of packing credit and such other liberal schemes allowed to exporters. Besides, there are various provisions for extending financial assistance to the industry by way of subsidies for farming purposes and for purchase of machinery.

But a question that has perhaps not been asked is: where has all the money that the industry and trade had earned during the last few years gone? The industry which tends to skirt around the point says that the 1974-77 boom was preceded by a virtual stagnation lasting over nearly two decades. The extra profit that the industry earned during this short period was eaten up by demands of pending liabilities, by essential development works which could not be postponed any longer, and by growing drafts by way of rise in input costs and wage bills and fiscal incidence.

Thus, even in the best of years, the balance sheet profits of most of the companies would hardly reflect the sunshine in which the industry had basked. It has been alleged that many companies would inflate their cost of production of tea by including in it all sorts of extraneous expenditures, including even the expenses incurred on foreign trips by directors and their families. Generally, the more reputed companies would take development programmes more earnestly and would be spending more money under this head, but their numbers would be small.

The fact that by and large the industry does not invest much on development activities is borne out also by a steady deterioration in the quality of average Indian tea. The tendency appears to have become more pronounced since the entry of a large number of new parties into the business in the wake of the recent price boom. Their only interest is in making profit. This is also the crowd which not very long ago had been operating in the jute trade and had lately been looking for a new hunting ground after messing up the fibre business.

But this point is seldom discussed in public on the false pretext that it would harm the interest of the Indian industry. What is not realised is that the people who run the business round the world are not fools and they know what is what. If today there is a slack in the demand for Indian tea abroad, the reason has to be partly attributed to the declining competitiveness of the Indian produce.

The fact is that there is still good demand for quality tea at a reasonable price. The growing demand for East African, especially Kenyan, tea underlines this fact. The Indian industry had been clamouring for total removal of the export duty which has already been reduced from Rs 5 per kilogramme to Rs 2 per kg on the plea that it would improve the competitiveness of our exports. But the tea would not be moving till the foreign customers are assured that they are getting their money's worth. Even amidst a general slack in overseas demand, good quality tea is being purchased quite briskly.

The other factor that seems to lie behind the slow offtake is the tendency noticed in the trade as well as among consumers to keep a low stock of tea. They know that there is enough tea around and that they can get all the tea for the asking. The traders, both in India and abroad, have thus chosen to keep their stocks to the minimum and not block too much of their money in inventories. There are nearly 600,000 retailers in India alone and if each of them decides to hold just 10 kg more in stock, the offtake would rise by six million kg.

This somewhat smug feeling about assured supplies has developed partly from New Delhi's stand that it would not allow exports to go up to such an extent that they would affect domestic availability. In any case, the exports are likely to fall considerably short of the stipulated 200 million kg and thus the domestic supplies would, if anything, be more than originally estimated. The other important factor is that the trend of production in India, which was rather wobbly in the early part of the season, appears to have staged an impressive rally and, according to the latest estimate, it should repeat, if not exceed, last year's figure of 560 million kg.

All this signals that a time of reckoning has come for the Indian tea industry. It had started taking things a little too easy and has now found to its dismay that things did not work out the way it had imagined. Either it copes up with the vicissitudes or it goes the way of jute. The challenge has already come; now is the time for response.

The Goodness of Bigness

Bigness has its advantages. The freedom to think along lines that enhance national priorities and the wherewithal to implement these thoughts.
Built-in resilience and resources, in order to be able to take entrepreneurial risks, promote ventures, explore natural resources, train and develop human potential, compete in international markets, and, most of all, discharge social responsibilities within the company, and towards society.
This is exactly what ITC has done. Apart from the Rs. 1,520 crores raised for the Government for public deployment in the last ten years, over Rs. 71 crores have been put into investments to provide growth. In effect, this has meant more employment, development of backward areas and industrial ancillaries and core sector activity. All adding to national growth.

I.T.C. Limited

The best means of growth come from within

RELIGION

Serving God and Mammon in TTD

Bhaskara Venugopal

RELIGIOUS institutions like temples, endowments, dharmadayams and maths in Andhra Pradesh are controlled by the Andhra Pradesh Charitable and Hindu Religious Institutions and Endowments (AP CHRIE) Act 1966. By Section 110 of this Act, five other acts that were in force ceased to operate. Curiously, with this repeal, an important provision made by the Charitable and Religious Trusts Act, 1920 which extended to the whole of India stood removed. Under Section 3 of the CRT Act 1920, "any person having interest . . . may apply by petition to the court . . ." for particulars as to the 'nature and objects of the Trust or as to any of these matters' and "the accounts of the trust". There is no substitute to this section under the AP CHRIE Act 1966.

The AP CHRIE Act 1966 consists of 113 sections out of which seven sections (85 to 91) forming Chapter XIV have particular reference to the Tirumala Tirupati Devasthanams (TTD).

One conspicuous feature of the Act is that it always talks only in terms of income in rupees lakhs or thousands. For example, Section 26 says "institutions or endowments whose annual income exceeds Rs 2 lakhs". But here is an institution like the TTD whose accounted income per annum is some 900 times that figure!

Section 86 of the Act authorises government to appoint a Board of Trustees to the TTD. The membership of the Board should not exceed 11. They will hold office for a term of three years. Three of them should be members from the state legislatures; one to represent scheduled castes and one representing women. An analytical study as to the effectiveness of this Board should throw up interesting results. The frequency with which the trustees meet, the expenditure on each meeting and each member, the duration of each meeting, the agenda and the minutes and a verbatim recording of the proceedings of the meeting that can give an idea about the members' interest in the proceedings should be able to give an estimate of the effective participation of each trustee.

As it is, a majority of the eleven members belong to Andhra Pradesh. The Act does not specify the region to which the members may belong. But pilgrims to Lord Venkateswara come from throughout the country and from all walks of life. Therefore it is reasonable that the Board should be enlarged so as to include distinguished persons from all the states of the country. Representation should be given to academicians, religious institutions and men from professions like medicine, law, journalism and the services. Under no conditions should membership on TTD Board be a *quid pro quo*.

Section 50 of the Act concerns the Budget. A crude analysis of the Budget as per the provisions in the section may be as follows: (1) It should show the probable receipts (Y) and disbursements of the institution or endowment during the following year. (2) It should provide for maintenance of the objects of the institution and remunerations for services received and 'dittam' (list of articles needed for worshipment) (a), discharge of liabilities and commitments (b) and the working balance (c). Then, if $a + b + c = X$, $Y - X$ will be equal to "balance of the income for the financial year" (or Z).

Section 50 sub-section 2 clause (a) item iv specifies that out of this Z, 40 per cent should be provided for the "arrangement to be made for securing the health, safety or convenience of the disciples, pilgrims, worshippers or other persons resorting to the institution or endowment" (A); 10 per cent should go to the 'Reserve Fund' (B); and 5 per cent to the Common Good Fund (C).

In other words, $A + B + C$ ($40 + 10 + 5$) which is 55 per cent of Z will have been spent and out of the remaining 40 per cent (as per Item vi of Clause (a) of sub-section 2 of Section 50) 30 per cent may be spent on construction of buildings etc. What will happen to the remaining amount? There is no direction in the Act. Hence it is imperative that budgeting procedure is clearly laid down.

Publication of TTD Budget

The major drawback of the Act concerning its Chapter VII which deals with Budget, Accounts and Audit is that while Section 50 sub-section (1) directs submission of the Budget to the Assistant Commissioner, Deputy Commissioner or Commissioner depending upon the income status of the institution, the enormous funds accruing with the TTD warrant a publication of the Budget in a printed form. The Act does not provide for this. Publication of the TTD Budget will not only enlighten the public as to what purposes their donations are being spent, but it will also help one know if the TTD Budget is making provision for various items in the appropriate manner and proportion as specified under Section 50, sub-section (2) clause (a).

Chapter IX of the AP CHRIE Act, dealing with the Surplus Fund and Utilisation thereof etc, specifies that "where there is a surplus in the funds after making adequate provision for purposes referred to in sub-section (2) of Section 50, such surplus may be utilised for purposes listed therein under Section 67". A perusal of the TTD Budget over the past few years suggests that there is no such statistic as a 'Surplus Fund' in that cyclostyled document. On the other hand, section 91 in Chapter 14 which deals specifically with TTD provides that the "funds" of Tirumala Tirupati Devasthanams may be utilised for so and so purposes. Now, does Section 91 obviate the need for arriving at a Surplus Fund before the "funds" are "utilised" for various purposes? Or, if arriving at a 'surplus fund' is a prerequisite, how does Section 91 omit using the term "surplus fund" and use only the word "funds" instead? And, how can the Budget skip arriving at a 'Surplus Fund'?

Nobody need have any dispute as to what purposes may TTD funds be spent or diverted. Apart from the doctrine of cypress, the Act repeatedly talks in an all pervading manner. For example, Section 67 sub-section (2) says: "Nothing in sub-section (1) shall prevent the trustee of a Math or a specific endowment attached thereto from utilising such surplus for any other purpose consistent with the tenets of the Math". Section 91 sub-section (1) says; "The funds of the TTD may be utilised for all or any of the following purposes and also for any other purposes permitted by any other provision of this Act." Over and above all this, Section 113 makes a blanket provision that if any difficulty arises, "the Government may,

by order in the AP Gazette, make such provisions not inconsistent with the purposes or provisions of this Act, as appear to them to be necessary or expedient for removing the difficulty".

During 1969, in accordance with Section 107, the Government passed an order (GOMS No 6) regulating the diversion of surplus funds for various purposes as laid down in section 67 and 91 of the Act. This rule specified that a Notice should be issued about the proposed utilisation. This Notice should be displayed either on the Notice Board of the institution or pasted to the front door of the institution. "Persons having interest" in the affairs of the institution may go, see the Notice and voice objections if any. Perhaps this provision is of some use in the case of a tiny Math or endowment. But as far as TTD is concerned this becomes farcical. How many of the "persons having interest" (even if all definitions of the "persons having interest" are taken into consideration) can go every time to the TTD door and look for the Notice? How can anybody see the notification when almost every month the Board meets and passes orders diverting funds to some use or the other?

It is therefore essential that only from surplus funds should any amounts be diverted for other purposes and no amount shall be spent unless sanctioned at least a month earlier. The sanction must be *made* by the full Board and not ratified; and such sanction must be made only after a public debate.

PITTSBURG TO PUTTUR

From Pittsburg to Puttur, TTD funds are being given away for some purpose or the other. Is it assured that all the purposes are genuine? Secondly, there is no provision anywhere in the Act for a check or verification by TTD about the utilisation of the sums given. Recently, the TTD was asking for a statement of account from the Thyagarajaswamy Trust Board, Tirupati about the annual grant proposed to be given for Thyagarajaswamy anniversary celebrations. There must be a statutory provision to facilitate this sort of a thing.

In view of the above, there is a strong case for a separate full-fledged and comprehensive act for TTD. Only a thorough and complete-by-itself act can help a more efficient management of TTD. Without resorting to any wild allegation, one may wonder how lakhs of rupees are allowed to be spent on the construction and maintenance of buildings like the rent-free, partly air-conditioned bungalow of the Executive Officer, the proposed posh guest houses, the magnificent administrative building, etc while thousands of pilgrims suffer for no fault of theirs, waiting on the roadside and railway platforms and corridors of the choultries and the cage-like shelters in the temple and bus stands spending their resources on sub-standard and unhygienic foods and drinks. These things not only suggest bad planning but a callous disregard of the human element in a devotee. Right from the arriving point in the bus stand or railway station to the sanctum sanctorum, the treatment meted out to the visitor (particularly to the poor and the non-Telugu Tamil-speaking affluent) is notorious for its arrogance and boorishness. Let the first surplus crore of the TTD be spent on better facilities to the pilgrim; nobody will bother if the balance is spent on installing a ceiling fan in the lavatory of the top officials residence or the seven feet high mosquito nets for the use of the VIP.

The Act that today governs the TTD activities is not at all suitable to control such a huge institution. As things stand, in spite of their best intentions, the Trust Board cannot say no when somebody high up 'solicits' a TTD contribution to some 'good' cause like a mountaineering Institute or some blessed temple in a VIP's native place. Even if nothing untoward has happened so far, in the interest of the funds contributed by all Indians, it is necessary that powers to circumvent or amend the provisions of the Act be vested with a sufficiently high authority.

The primary concern of the Trust Board must be the pilgrim. The acid test should be the smile on a satisfied pilgrim's face, not a rise in the annual income *which may be bloated up by* a simple resorting to selling the age old temple gold under the pretext that the price is lucrative. (Please read Explanation (3) under sub-section (3) of Section 59: "Receipts in kind other than those referred to items (g) and (h) of explanation (1) shall be deemed to accrue as income on the date of the sale thereof and shall be valued at the amount realised by such sale.").

Tolerance is supposed to be the hallmark of Hindu religion. But, religion conducive and contributing to the birth, growth and perpetuation of corruption is intolerable.

MANIPUR

Revivalist Resurgence

ONE of the major problems of the north-eastern region is 'insurgency', especially in the adjoining states of Nagaland and Manipur and the union territory of Mizoram. The vague and blanket concept of 'insurgency' appears really to be an accumulated and concentrated but surface expression of deeper problems of a social, economic and political character which are a legacy of the past. But at the policy-making level, the tendency has been to view the 'insurgency' as a purely law and order problem or even see it in purely military terms requiring military solutions.

The state of Manipur falls naturally into the valley and the hill districts. The valley is thickly populated by mainly the indigenous Meiteis while the hill districts are inhabited, by and large, by the Naga, the Mizo and some other tribal people. The practice of settled agriculture in the rich and fertile valley area over a long period of time and the penetration into this region of Bengali culture and Vaishnava cult has given a distinctive character to the Meitei people and has even fostered in them a sense of superiority over the tribal people of the state. On the other hand, the tribal people have practised shifting cultivation over the years and are thinly spread out in the fairly extensive hill districts. While the 'insurgency' in Nagaland and Mizoram has flowed into and affected the hill districts of Manipur, inhabited mainly by Nagas and Mizos, the valley area has been having its own variety of 'insurgency', which is a fitful expression of the activities of the Meitei revolutionary extremist movement. This 'insurgency', somewhat dormant for years, has suddenly sprung into life recently with the series of violent incidents involving the killing of policemen, snatching of arms and so on that are being occasionally reported.

The Meitei revolutionaries are the extremist fringe of the social movement in the valley area which stands for the revival and regeneration of the old Manipuri religion, language, script and culture which, in their view, has been overlaid by Bengali (Vaishnav) culture, religion and script. The movement is also an expression of the reaction and resentment of sections of the Manipuri people, especially the youth, against the economic exploitation by 'Mayangs' — earlier Bengali but later Marwari and Punjabi traders and moneylenders. It is also a cultural throwback to the past, not unusual in periods of complex transition from the old to the new. Pre-British memories of an independent and sovereign Manipur coupled with experience of privations caused by socio-economic factors in the post-independent period and the rise of social and political consciousness appear to constitute some of the main elements which influence the activities of the extremists.

There are many overground (and at least one underground) organisations which are an expression of this socio-cultural movement. The Pan Manipuri Youth League, Meitei Marup and other organisations operate overground while the United National Liberation Front (UNLF) operates underground. The Pan Manipuri Youth League was formed in 1968 with the object of working for the social, cultural, economic and educational advancement of Meitei people and for preserving the Meitei culture and tradition. This organisation publishes some Manipuri and English journals. The Meitei Marup was organised in the 1930s with the object of reviving the old Meitei religion and script. The UNLF was formed in 1964 under the leadership of a group of young men with revolutionary ideas. For various reasons, the UNLF could not stabilise itself and build a solid base. The Revolutionary Government of Manipur (RGM), also known as the Consolidation Committee, was reportedly formed by a break away group of UNLF in 1968. It consisted apparently of those who believed in immediate armed revolution as against those in the UNLF who, although not renouncing and armed struggle, believed in a slower process of transition through social, cultural and political activities. The members and followers of the RGM wanted to develop contact with the erstwhile East Pakistan, and in 1969, a RGM group was intercepted in Tripura on its way back from East Pakistan. During prison life, some of these reportedly came in contact with some Naxalites. However, Marxist influence may not be very strong inside the RGM. Though the RGM was weakened in 1969 it did not apparently disintegrate but was kept alive by isolated groups of young men in the valley. After the formation of Bangladesh, some of these youths are believed to have turned towards China. The identity and the precise political complexion of the group or groups which have been involved in some recent encounters with the police is still not clear. In two incidents early 1978, a weapon was snatched away from a police man and a local petrol bunk was looted. In the second half of July, three other major incidents followed one another dramatically. In the first, a police sub-inspector and constable escorting a prisoner to the court were shot dead and their weapons snatched away. In the next, some assailants attacked a local bank in the bazar during day and carried away a sum of over Rs 19,000, most of which was later recovered. On July 19, some persons boarded a public transport bus near Imphal, scared away the passengers and shot dead two police personnel inside the bus. There have been two other more recent incidents attributed officially to 'armed rebels'; on the night of November 12-13, five police personnel were injured in an encounter with 'armed rebels' at Kameng foothills; and on November 18, the 'armed rebels' raided Mayang police station in Manipur Central District and took away with them one rifle and a wireless set. They also set the police station on fire.

The overground social and cultural organisations of the Meiteis have been functioning with remarkable persistance and a kind of narrow, sectarian but shrill vitality. Their following is explained by the fact that they express in social and cultural terms the problems and dilemmas of a people increasingly harassed by the contradictions of a distorted process of economic development and social progress. They also symbolise divide between the younger and older generations of Meitei leaders and the protest of the former against the vicious, unscrupulous and opportunistic manoeuvres, tactics and compromises of the latter. These organisations are, therefore, likely to continue to be active till their genuine demands are met or, indeed, even beyond for the protection and preservation of the basic Meitei cultural and social interests.

PHILIPPINES

Rule of Family under Martial Law

Sumanta Banerjee

AT the National Press Club in Manila, an official of the US embassy in the Philippines is introduced to the guests as a CIA agent; the remark is greeted by laughter in which the American also joins.

More than anything else, such an incident illustrates the scepticism with which the Filipinos regard the "anti-Americanism" of President Marcos. It also suggests the unimportance that the US attaches to Marcos's thunderous broadsides against 'American imperialism'.

The US is sure of its hold on the Philippines. With Marcos's blessings, his daughter Imee Marcos is leading a 'movement' for the immediate dismantling of the US airbase at Clark Field and the naval base at Subic. Yet, in August this year, the US Congress restored in full the cut earlier made from the programmed military aid to the Philippines, which amounted to almost $ 18 million. The argument was that the US bases in the Philippines and the interests they represented should prevail over public concern about increasing Marcos repression on the Filipino people. Total US aid to the Philippines increased from $ 771.3 million in 1972 (on the eve of the clamping down of martial law) to $ 3912.5 million in 1976, the total aid since the declaration of martial law being $ 3141.2 million.

In fact, one of the reasons for the imposition of martial law was to rescue American economic and military interests from the tide of nationalism that was engulfing the Philippines On the eve of the martial law declaration, the Supreme Court had ruled that American citizens had been holding on illegally to land and real estate properties since 1946, as well as illegal directorships in Filipinised industries. Following this there were demands for proceedings against American owners of land and real estate properties. Martial law had to be imposed if approximately two billion US dollars of American assets were to be saved from expropriation and nationalisation. Marcos granted a year's moratorium in May 1974 on the reversion to Filipino hands of American-owned land. When that deadline was reached in middle 1975, further leeway was given, and Marcos reassured the American land owners that there would be no summary escheat proceedings.

'Anti-Americanism' of Marcos

Like the sham anti-colonialism of the Indian ruling classes, best exemplified by Nehru and his daughter, the 'anti-Americanism' of Marcos is skin-deep. He breathes fire against the US only when the latter's policies hurt his personal interests. Thus, at the moment he is annoyed with the US because the US Justice Department is currently investigating charges that Westinghouse Electric Corporation paid Herminio T Disini, a relation of Marcos, a substantial commission for arranging the $ 1.1 billion Westinghouse contract for a nuclear plant in the Philippines.

The 'anti-Americanism' of the martial law government is motivated by several factors. First, in a bid to appeal to the anti-American sentiments of the Filipinos, Marcos resorts to the nationalist rhetoric. In this, he also seeks to identify himself with the American critics of the US official policies posing as a champion of anti-colonialism. Secondly, the posture of anti-Americanism is a useful bargaining leverage. He is threatening the US with an anti-American agitation to pressurise it to grant him $ 1 billion rent for the US bases. Finally, like Nehru in the 1950s, Marcos has his trump-card. "If you back out, I'll move over to the Socialist camp!" In a recent policy speech, he identified one of his government's main foreign-policy guidelines: "to pursue more vigorously the establishment of diplomatic relations with the Socialist states, in particular with the People's Republic of China and with the Soviet Union."

The rapprochement with the socialist camp started in 1972 — the year of the martial law declaration — with the recognition of Yugoslavia and Romania. From September to November of 1973, diplomatic ties were established in quick succession with East Germany, Hungary, Poland, Czechoslovakia, and Bulgaria. From the Soviet Union to the Philippines came a stream of economic, scientific and cultural missions, including the Bolshoi Ballet, following a tour of the Soviet Union by Imelda Marcos in 1972.

In keeping with the Soviet bloc, the pro-Moscow Communists of Philippines switched over their loyalty to the martial law regime. The veteran Communist leader, Luis Taruc emerged from the underground and pledged his support to Marcos's 'New Society' movement — a counterpart of Indira Gandhi's 'Garibi Hatao' programme. *Taruc is today the Special Advisor on* Land Reforms in the martial law government.

Marcos's next target was China. In September 1974, Imelda Marcos made a historic ten-day goodwill visit to China. In June next year, Marcos himself accompanied by Imelda visited China and was received by Mao Tse tung. The visit was televised in the Philippines. An underground Filipino Communist guerilla described his reaction as a "televised shock of having to watch Chairman Mao embrace the bediamonded wife of the man who made possible the mass arrests and torture of our top party cadres."

The Maoists of the Philippine were in for a greater shock. In October 1975, China came out with official endorsement of the ASEAN, an organisation of the South-East Asian governments which Maoists all over the region had been condemning as a counter-revolutionary gang-up. China was also reported to have requested the Philippine government to retain the US bases as a deterrent to Soviet social imperialism. This was too much for the Communist guerillas, who are facing the full brunt of the US backed repression of the Marcos regime to stomach. One of their underground journals was forthright when it said: "We must continue the struggle to remove all US bases in Asia and expose counter revolutionary alliances like ASEAN, whether it works against Chinese national interests or not." (*Balita Ng Malayang Pilipinas*, September 30-October 7, 1978.)

State of the Economy

But it is worth looking at Marcos's performances during the martial law period to find out whether either Soviet or Chinese support to the regime is really warranted. The much propagated reform programme has parallels to the Indian experiment. The fields of reform are: land reform, peace and order, government reorganisation and social services, among other things. The agricultural showpiece of Marcos's New Society is the 'Masagana 99' programme (Masagana is Filipino for 'abundance' and 99 stands for the target of 99 cavanes, equivalent to 50 kilograms, of output per hectare). But although the programme has led to in-

creased rice production, enabling the Philippines to export rice today, it has barely touched the lives of the poor peasants. According to the Manila-based International Rice Research Institute indicates "Since land reform and the adoption of new rice technology the total income in the village has increased, but large tenants seem to have captured the major benefits... If present trends continue, farm size will decline further and landless labourers will continue to increase in number relative to farmers. Real wages will decline and the value of tenancy rights will rise, widening the income gap between farmers and landless workers." ('Research Highlights for 1977': International Rice Research Institute, Manila).

Unofficial surveys by academics reveal that many of those small farmers who have failed to pay the loans advanced under the Masagana 99 programme, are in danger of losing their land titles to rural banks, controlled mostly by landlords and rich people. In spite of the much-vaunted promises of benefits for sharecropper, sharecropping on a 50-50 basis is still being practised in many places.

It is significant that Marcos has left the most profitable agricultural sources outside his land reforms programme. Sugar is a vital sector of the Philippines economy, accounting for one-fifth of annual foreign exchange earnings. The country is also the world's largest producer and exporter of coconut products; one-fifth of the country's export receipts is earned by the coconut industry. Bananas are among the ten top exports and are expanding their hectarages. Yet, the plantations covered by sugar, coconut and banana are allowed to be occupied by big landlords and giant corporations like Stanfilco, Philpak and Tagum Development Corporation. Moreover, because of Marcos's stress on export-oriented growth, rich farmers are converting rice and corn lands into sugar plantations to supply the needs of the newly-established Cagayan Sugar Corporation.

Let us have a look at some other aspects of Filipino economy. According to an ESCAP report of 1975, the percentage of Filipinos living below the poverty threshold jumped from 39 per cent (approximately 13.4 million) in 1965 to 48 per cent (20.5 million) in 1975. In January, 1978, Clemente S Gatmaitan, Secretary of Public Health of the Philippines Government admitted that 78 out of every 100 pre-school children weighed in a nation-wide project of the Department of Public Health were found to be suffering from various degree of malnutrition.

Inflation is rising. The third quarter of 1978 showed inflation rates of 2.4 per cent against 1.3 per cent during the low end-of-the-second quarter of the year. Another chain of price hikes is in the offing as additional tax measures are being proposed during 1979. To a consumer, new taxes can only mean reduced incomes or higher prices. Already, 79 per cent of the people earn less than 5,000 pesos (equivalent approximately to the Indian rupee) annually, according to this year's National Economic Development Authority Statistical Yearbook. The Development Academy of the Philippines estimates that at least 800 pesos a month is necessary for a family of five to subsist.

While fashionable shopping centres like Makati in Manila boast of huge departmental stores and the discos at Mabini draw streams of tourists in search of the legendary 'night life' of Manila, a few miles away in Tondo one can see scabby children clothed in rags, wretched shanties straining to remain upright, fetid canals teeming with mosquitoes. Squatter colonies have sprouted all over the place. Like India during the Emergency again, the Marcos regime has launched a Zonal Improvement Programme aimed at the demolition of squatter colonies. The slum dwellers are pushed into relocation sites that are unable to provide them adequate housing conditions and are miles away from their sources of income. In May this year, around 860 families were evicted from Constitution Hill, one of the seats of political power, to make way for a multi-million peso Parliament Biulding.

Like in India again, the much-propagated anti-corruption drive of Marcos has finally ended up in the perpetuation of a political dynasty and nepotism. His wife Imelda Marcos, as deputy prime minister, is authorised to act as the Prime Minister in case of Marcos's permanent disability. His relations and cronies occupy important positions in business firms and newspaper establishments. In deferrence to the American insistence on 'human rights', Marcos has signed a Presidential Decree which supposedly protects the right of detained persons by penalising any public officer who fails to produce a detained person to the proper judicial authorities within a prescribed period. But significantly, the decree adds, persons suspected of making an attempt on, or conspiring against the life of the President, or any member of his family are exempted from the coverage of the decree. In other words, such suspected persons can be detained indefinitely without trial. Thus, the easiest way to keep political dissidents behind bars is to accuse them of such crimes.

As for reforms in the law and order situation, martial law does not appear to have brought about any basic improvement. In 1971, 59 per cent of the index crimes in the country happened in metropolitan Manila. By 1974, the crime rate in the zone had risen to 81 per cent. Today, even the controlled Manila press is forced to carry news of increasing crime incidence, in which the military is getting involved. Military assault on a parish priest in November evoked a nationwide protest, leading to demands for disciplinary action against the erring military personnel.

But then, the military is most pampered; one-sixth of the total expenditure in 1979 is earmarked for the Armed Forces. If along with this, the expenditure on the various information departments — which mainly do propaganda about the benefits of martial law — is taken into account, it will be found that one-fourth of every peso is spent by the government to support Martial Law.

Opposition to the Regime

Marcos's dependence on the armed forces can be understood in the context of the prevailing situation in the Philippines. The people are not taking the economic deprivations and curtailment of democratic rights lying down. Centres of militant protest and intellectual dissent have sprouted up in several areas.

Although the government tends to play down the threat from the insurgency movements, the two centres of armed struggle — one in the north headed by the Communists, and the other in the south led by the Muslim separatists — have explosive potentialities.

First, the Communist threat. The armed wing of the underground Communist party of the Philippines (CPP), known as the New People's Army (NPA) is believed to be expanding its 'guerilla zones'. According to one underground source, the Communists are fighting against

the stranglehold of US imperialism, unjust feudal relations, and corrupt and conniving bureaucrat capitalists". Their aim is to establish a national democratic Philippine state. Sixty per cent of their arms are seized from the military during encounters and lightning raids. Another large source of arms are donations from the villagers. According to the military, Mount Province, Abra and Nueva Vizcaya in northern Philippines — which were the strongholds of the Huk Communists in the 1950s — are "insurgency zones".

After a phase of emasculation under the leadership of the pro-Soviet ideologue Luis Taruc — during the late 1950s and early 1960s — when the Communists laid down their arms, in the late 1960s there was a new upsurge and the Communist Party of the Philippines was reinvigorated by Jose Maria Sison, a young Maoist in his late thirties, whose book "Philippine Society and Revolution" was the most widely read book among students and intellectuals before the imposition of martial law in 1972. A brilliant student, he disappeared in 1967 from the faculty lounge of the University of Philippines' political science department and the radical chic cafes to spearhead the re-establishment of the Communist Party in the hills of central Luzon. Although he was captured by the military in 1977, he had by then been able to build up the army and the party cadres to an extent to enable them to carry on operations even without guidance from the top leaders. Along with Sison, other important leaders are now behind bars. But NPA attacks on military posts, assassination of government officials, armed propaganda in villages still continue. Although the government claims that it has smashed the NPA, almost every day the military is involved in encounters with armed 'terrorists' according to government reports. Such encounters have spread beyond the traditional Communist stronghold of Luzon, and are now being reported from the Samar-Leyte area in central Philippines. It seems that the NPA has a firm base among peasants, specially in the north Philippines. A recent survey by sociologists of the Cagyan Valley in this area revealed that peasants were suffering from grinding poverty, malnutrition, illiteracy, intensified oppression by landlords and the military. The report concluded: "There is a great possibility that waves of peasant uprisings throughout the region may just happen in the not-too-distant future."

STRUGGLE IN MINDANAO

But militarily more effective as a threat is the Moro National Liberation Front armed struggle in Mindanao in South Philippines. The area has rich mineral resources — nickel, iron ore, manganese, silver, zinc and cobalt. The present conflict has been raging since 1972 with the active entry of the Muslim population into the quest for regional autonomy. The conflict is basically over land. The traditional communal system of land ownership among the Moros was replaced by maldistribution of land. There was an overemphasis on the production of export crops like banana and sugar at the expense of staple foods. To top this amalgam of misplaced government priorities was the entry of the giant corporations — Del Monte, Dole and Japanese investments in Misamis Oriental. To the last group go the island's nickel, copper and timber. Small farmers were forced to yield their land to the corporate farms formed by the big concerns.

According to one estimate the MNLF has a strength of 20,000 armed soldiers. It receives arms supplies from Libya. There is regular gun running between Mindanao and Sabah in the north of Indonesia. The rebels are well-etrenched among the local population. Of late, the behaviour of the military has pushed not only the Muslim population towards the MNLF, but has also driven the Christians against Marcos. From a meeting of Filipino Muslims and Christians recently a letter was sent to Marcos pointing out that both Muslims and Christians were suffering equally from military atrocities.

But Marcos is more worried over recent reports of NPA penetration in Mindanao. NPA sources report the establishment of five guerilla zones in the area. Instead of trying to compete with the MNLF, the NPA seems to have established some sort of understanding with the Moro rebels. In many places joint operations against the military have been reported.

The other important centre of opposition is the church. Like the radical clergy of Latin American countries, a leftist section among the catholic priests is taking a prominent role in organising working class and peasantry on issues like demands for higher wages, right to form unions and launch strikes, and release of political prisoners. One such instance is their mobilisation of the Kalinga tribesmen in north Philippines against the Chico dam project. Completion of the dam would place around 350,000 hectares of the area under water making over 100,000 tribals homeless.

The radical catholics have also formed the Association of Major Religious Superiors and created a Task Force Detainees to defend political prisioners. In the first few weeks of martial rule, not less than 30,000 were thrown into military stockades. Though a large number have been released under occasional amnesty announcements, most of them come under the category of TRD (Temporarily Released Detainees) who are required to report to the authorities regularly. Some among them have been recalled for so-called 'security reasons'. Besides, according to church sources, for every one released, nine are arrested. The targets of arrest are not only NPA and MNLF activists, but also churchmen and workers. From February to April this year, a total of 15,000 workers from at least 12 firms set off a round of strike actions shutting down a sizeable portion of metropolitan Manila's hotel, garments, transport, motor and electrical industries. Withholding of wage payments, non-implementation of legislated allowances and benefits, wage freeze, preventive suspensions, unauthorised lay-offs and other grievances were the issues behind the upsurge of mass walkouts.

While these elements represent the extra-constitutional opposition to the military regime, there are the liberals and other political groups who are striving for restoration of democracy on the basis of parliamentary elections. The former President Diosdado Macapagal has proposed the forming of a transitional junta to be composed of three ex-justices to pave the way for the holding of elections after Marcos is made to resign But because of their strong pro-American leanings, these politicians are not likely to find much support from the Filipino masses.

Thus, there is widespread opposition to Marcos operating at almost all levels of Filipino society. But can these different strands converge into a

single united offensive?

The Filipino Opposition faces a tough enemy in Marcos. As suggested earlier, he has succeeded in mobilising behind him an international line-up of support ranging from the US on the one hand to the Soviet Union had China on the other. Inside the country, a potential threat could have been dissidents or disgruntled elements in the powerful Armed forces — as it usually happens in authoritarian regimes. But Marcos has removed the senior dissidents in the army, either by retiring them and packing them off as ambassadors or posting them as heads of industrial establishments. To neutralise the foreign press, particularly the American press which of late has been vociferous in its protests against Marcos' attacks on democratic rights, Marcos in a memorandum in September this year ordered all government departments to allow mass media access to all 'unclassified information.' This provides the loophole to the Armed Forces or the Ministry of National Defence officials who can refuse media access on the ground that the information they possess is 'classified'. Besides, however much Marcos may claim to be normalising the process of press freedom, the Print Media Council can still revoke the permit of any journal or radio station. While a radio station was closed down sometime ago in Mindano, a church publication, *The Sign of the Times*, was banned recently. One of the well known journalists of the pre-martial law era, Satur Ocampo, former Assistant Business Editor of Manila Times, is still languishing in jail.

Marcos realises that in the absence of effective constitutional opposition, and given the weakness of the liberal and other such constitutional groups, the most serious resistance comes from the insurgents — the Communist and the Moros — and the growing popularity of the Catholic radicals. His armed strength therefore is concentrated against these forces. Although the Liberal party leader Benigno Aquino, who was sentenced by a military court to death firing squad last year, is still in jail, the majority of the prison inmates are members and sympathisers of the Communist Party, the NPA and the MNLF.

The other potential threat are the students. The University of the Philippines used to be the hub of Communist student movement before the imposition of martial law. The majority of the student activists have either been killed or put behind bars. In Indira Gandhi's style again, Marcos is trying now to woo and corrupt the next generation of students. His daughter, Imee has formed the 'Kabatang Barangay's, a youth organisation which mouths anti-American slogans, fosters the Marcos personality cult, and seeks to create a coterie of youth leaders by giving them positions of power. Marcos is spending nine million pesos every year on this organisation.

But in spite of such massive efforts at brainwashing and corrupting the youth, the Filipino students refuse to be brought over to the side of the poseurs. Last month the Manila daily, *Bulletin Today*, polled at random eight colleges and universities to find out who the heroes of today's college students were. Along with the names of the Filipino nationalist leaders of the past — Jose Rizal, Andres Bonifacio — one name cropped up frequently in the list of the favourite heroes, he was Jose Maria Sison, the imprisoned Communist leader. Needless to say, the daily could not publish the results of the poll. Although the report was composed by the press, it had to be withdrawn at the last moment, and the November 26 edition of *Bulletin Today* had to come out without its regular Sunday magazine section.

If the extra-constitutional opposition to Marcos grows too powerful, to stave off a leftist takeover, the US may switch over their protection from Marcos to one of the Liberal Opposition leaders. The protest can thus be taken off from the streets to parliament. Will a Filipino counterpart of the Indian Janata party replace Marcos?

While foreign journalists in Manila's cocktail parties speculate on such possibilities, a worker in Tondo watches his shanty being torn down by a demolition team, holding his anger in check; a young priest moves stealthily into a fishing village and says: "We will betray our biblical faith and our heritage unless we join in the struggle", a lawyer runs risks to extend the limits of what freedom the regime allows by fighting for the release of imprisoned Communists; a military man who remains anonymous informs the civil rights activists of the death of a political prisoner under severe torture, and a young Filipino student takes us to the Jose Rizal museum, perhaps to capture the echo of the memory of that strange illusion of freedom for which his race had fought in the past.

European Monetary System

AN agreement to set up a European Monetary System (EMS) on January 1, 1979 was reached at a meeting of the European Council in Brussels on December 4-5, 1978. Belgium, Denmark, the Federal Republic of Germany, France, Luxembourg, and the Netherlands indicated immediately following the meeting that they would become members of the EMS. The Italian Prime Minister, Guilio Andreotti, said on December 12 that he recommended that his country should join the EMS as of January 1, 1979, and the Italian Parliament approved on December 13. Of the other EC members, Ireland will take a decision soon as to whether it will participate in the EMS from the outset, while the United Kingdom does not intend to participate in the new system at this stage. Norway, which had been a member of the European common margins arrangement (the 'snake'), announced on December 11 that it was withdrawing from the 'snake' and would not participate in the EMS.

Following is the text of the Resolution of the European Council of December 5, 1978 on the establishment of the EMS and related matters.

(A) The European Monetary System

(1) *Introduction*

1.1 In Bremen we discussed a "scheme for the creation of closer monetary co-operation leading to a zone of monetary stability in Europe." We regarded such a zone "as a highly desirable objective" and envisaged "a durable and effective scheme."

1.2 Today, after careful examination of the preparatory work done by the Council and other Community bodies, we are agreed as follows: A European Monetary System (EMS) will be set up on January 1, 1979.

1.3 We are firmly resolved to ensure the lasting success of the EMS by policies conducive to greater stability at home and abroad for both deficit and surplus countries.

1.4 The following paragraphs deal primarily with the initial phase of the EMS.

We remain firmly resolved to consolidate, not later than two years after the start of the scheme, into a final system the provisions and procedures thus created. This system will entail the creation of the European Monetary Fund as announced in the conclusions of the European Council meeting at Bremen on July 6-7, 1978 [*IMF Survey*, July 17, 1978, page 209], as well as the full utilisation of the ECU as a reserve asset and a means of settlement. It will be based on adequate legislation at the Community as well as the national level.

(2) *The ECU and Its Functions*

2.1 A European Currency Unit (ECU) will be at the center of the EMS. The value and the composition of the ECU will be identical with the value of the EUA at the outset of the system.

2.2 The ECU will be used.

(a) As the denominator (numeraire) for the exchange rate mechanism.

(b) As the basis for a divergence indicator.

(c) As the denominator for operations in both the intervention and the credit mechanism.

(d) As a means of settlement between monetary authorities of the EC.

2.3 The weights of currencies in the ECU will be re-examined and if necessary revised within six months of the entry into force of the system and thereafter every five years or, on request, if the weight of any currency has changed by 25 per cent.

Revisions have to be mutually accepted; they will, by themselves, not modify the external value of the ECU. They will be made in line with underlying economic criteria.

(3) *The Exchange Rate and the Intervention Mechanism.*

3.1 Each currency will have an ECU-related central rate. These central rates will be used to establish a grid of bilateral exchange rates.

Around these exchange rates fluctuation margins of ± 2.25 per cent will be established. EC countries with presently floating currencies may opt for wider margins up to ± 6 per cent at the outset of EMS; these margins should be gradually reduced as soon as economic conditions permit to do so.

A Member State which does not participate in the exchange rate mechanism at the outset may participate at a later date.

3.2 Adjustments of central rates will be subject to mutual agreement by a common procedure which will comprise all countries participating in the exchange rate mechanism and the Commission. There will be reciprocal consultation in the Community framework about important decisions concerning exchange rate policy between countries participating and any country not participating in the system.

3.3 In principle, interventions will be made in participating currencies.

3.4 Intervention in participating currencies is compulsory when the intervention points defined by the fluctuation margins are reached.

3.5 An ECU basket formula will be used as an indicator to detect divergencies between Community currencies. A "threshold of divergence" will be fixed at 75 per cent of the maximum spread of divergence for each currency. It will be calculated in such a way as to eliminate the influence of weight on the probability to reach the threshold.

3.6 When a currency crosses its "threshold of divergence", this results in a presumption that the authorities concerned will correct this situation by adequate measures, namely: (a) diversified intervention, (b) measures of domestic monetary policy, (c) changes in central rates, (d) other measures of economic policy.

In case such measures, on account of special circumstances, are not taken, the reasons for this shall be given to the other authorities, especially in the "concertation between central banks".

Consultations will, if necessary, then take place in the appropriate Community bodies, including the Council of Ministers. After six months these provisions shall be reviewed in the light of experience. At that date the questions regarding imbalances accumulated by divergent creditor or debtor countries will be studied as well.

3.7 A Very Short-Term Facility of an unlimited amount will be established. Settlements will be made 45 days after the end of the month of intervention with the possibility of prolongation for another three months for amounts limited to the size of debtor quotas in the Short-Term Monetary Support.

3.8 To serve as a means of settlement, an initial supply of ECUs will be provided by the EMCF [European Monetary Cooperation Fund] against the deposit of 20 per cent of gold and 20 per cent dollar reserves currently held by central banks.

This operation will take the form of specified, revolving swap arrangements. By periodical review and by an appropriate procedure it will be ensured that each central bank will maintain a deposit of at least 20 per cent of these reserves with the EMCF. A Member State not participating in the exchange rate mechanism may participate in this initial operation on the basis described above.

(4) *The Credit Mechanisms*

4.1 The existing credit mechanisms with their present rules of application will be maintained for the initial phase of the EMS. They will be consolidated into a single fund in the final phase of the EMS.

4.2 The credit mechanisms will be extended to an amount of 25 billion ECUs of effectively available credit. The distribution of this amount will be as follows: Short-Term Monetary Support of 14 billion ECUs, Medium-Term Financial Assistance of 11 billion ECUs.

4.3 The duration of the Short-Term Monetary Support will be extended for another three months on the same conditions as the first extension.

4.4 The increase of th Medium-Term Financial Assistance will be completed by June 30, 1979. In the meantime, countries which still need national legislation are expected to make their extended medium-term quotas available by an interim financing agreement of the central banks concerned.

(5) *Third Countries and International Organisations*

5.1 The durability of EMS and its international implications require coordination of exchange rate policies *vis-a-vis* third countries and, as far as possible, a concertation with the monetary authorities of those countries.

5.2 European countries with particularly close economic and financial ties with the

European Communities may participate in the exchange rate and intervention mechanism.

Participation will be based upon agreements between central banks; these agreements will be communicated to the Council and the Commission of the EC.

5.3 EMS is, and will remain, fully compatible with the relevant Articles of the IMF Agreement.

(6) Further Procedure

6.1 To implement the decisions taken under A, the European Council requests the Council to consider and to take a decision on December 18, 1978 on the following proposals of the Commission:

(a) Council Regulation modifying the unit of account used by the European Monetary Cooperation Fund, which introduces the ECU in the operations of the EMCF and defines its composition;

(b) Council Regulation permitting the EMCF to receive monetary reserves and to issue ECUs to the monetary authorities of the Member States which may use them as a means of settlement.

(c) Council Regulation on the impact of the European Monetary System on the Common Agricultural Policy [*IMF Survey*, November 20, 1978, page 361]. The European Council considers that the introduction of the EMS should not of itself result in any change in the situation obtaining prior to January 1, 1979 regarding the expression in national currencies of agricultural prices, monetary compensatory amounts [MCAs], and all other amounts fixed for the purposes of the Common Agricultural Policy.

The European Council stresses the importance of henceforth avoiding the creation of permanent MCAs and progressively reducing present MCAs in order to re-establish the unity of prices of the Common Agricultural Policy, giving also due consideration to price policy.

6.2 It requests the Commission to submit in good time a proposal to amend the Council Decision of March 22, 1971 on the Introduction of a Mechanism for the Medium-Term Financial Assistance to enable the Council of Economic and Finance Ministers to take a decision on such proposal at their session of December 18, 1978.

6.3 It requests the central banks of Member States to modify their Agreement of April 10, 1972 on the reduction of margins of fluctuation between the currencies of Member States in accordance with the rules set forth above (see paragraph 3).

6.4 It requests the central banks of Member States to modify as follows the rules on Short-Term Monetary Support by January 1, 1979 at the latest.

(a) The total of debtor quotas available for drawings by the central banks of Member States shall be increased to an aggregate amount of 7.9 billion ECUs.

(b) The total of creditor quotas made available by the central banks of Member States for financing the debtor quotas shall be increased to an aggregate amount of 15.8 billion ECUs.

(c) The total of the additional creditor amount as well as the total of the additional debtor amount may not exceed 8.8 billion ECUs.

(d) The duration of credit under the extended Short-Term Monetary Support may be prolonged twice for a period of three months.

(B) Measures Designed to Strengthen the Economies of the Less Prosperous Member States of the European Monetary System.

1 We stress that, within the context of a broadly based strategy aimed at improving the prospects of economic development and based on symmetrical rights and obligations of all participants, the most important concern should be to enhance the convergence of economic policies toward greater stability. We request the Council (Economic and Finance Ministers) to strengthen its procedures for coordination in order to improve that convergence.

2 We are aware that the convergence of economic policies and of economic performance will not be easy to achieve. Therefore, steps must be taken to strengthen the economic potential of the less prosperous countries of the Community. This is primarily the responsibility of the Member States concerned. Community measures can and should serve a supporting role.

3 The European Council agrees that in the context of the European Monetary System, the following measures in favour of the less prosperous Member States effectively and fully participating in the exchange rate and intervention mechanisms will be taken:

3.1 The European Council requests the Community Institutions by the utilisation of the new financial instrument and the European Investment Bank to make available for a period of five years loans of up to 1,000 million EUAs per year to these countries on special conditions.

3.2 The European Council requests the Commission to submit a proposal to provide interest rate subsidies of 3 per cent for these loans, with the following elements: the total cost of this measure, divided into annual tranches of 200 million EUAs each over a period of five years shall not exceed 1,000 million EUAs.

3.3 Any less prosperous Member Country which subsequently effectively and fully participates in the mechanisms would have the right of access to this facility within the financial limits mentioned above. Member States not participating effectively and fully in the mechanisms will not contribute to the financing of the scheme.

3.4 The funds thus provided are to be concentrated on the financing of selected infrastructure projects and programs, with the understanding that any direct or indirect distortion of the competitive position of specific industries within member states will have to be avoided.

3.5 The European Council requests the Council (Economic and Finance Ministers) to take a decision on the above-mentioned proposals in time so that the relevant measures can become effective on April 1, 1979 at the latest. There should be a review at the end of the initial phase of the EMS.

4 The European Council requests the Commission to study the relationship between greater convergence in economic performance of the Member States and the utilisation of Community instruments, in particular the funds which aim at reducing structural imbalances. The results of these studies will be discussed at the next European Council.

Democracy and Muslim Education

Moin Shakir

Education of a National Minority: A Case Study of Indian Muslims by Krishna Dev Sharma; Kalamkar Prakashan, New Delhi, 1978; pp 255, Rs 50.

THIS book attempts to study the state of school education of the Muslim community. K D Sharma has selected Delhi, an important urban cluster of Muslims, for empirical investigation. He has used survey research techniques and administered elaborate questionnaires to a cross-section of respondents drawn from among students, teachers, parents and political leaders. The three hypotheses formulated for investigation are:

(i) Other things being equal, the Muslim community tends to have less than equal share of educational opportunities as compared with non-Muslim;

(ii) there exists an element inherent in the educational programmes which discourage Muslims from taking advantage of educational opportunities in an equal measure with non-Muslims; and

(iii) the social, economic and cultural conditions of the Muslim community tend to restrict the utilisation of educational opportunities by its members as compared with non-Muslims.

On the basis of the data, Sharma concludes that the Muslim community is behind others in the use of educational opportunities. The living conditions of the Muslim students, poor educational backgrounds of Muslim parents, poor library facilities, etc, adversely affect the provision of and access to equal educational opportunities for Muslims. Besides, socio-cultural and religio-economic factors constitute a hindrance to the promotion of Muslim education. Muslim parents' abhorrence of modern education is also responsible for the unsatisfactory state of education among Muslim women in the country.

Sharma reinforces his argument by raising the issue of the position of minorities in Indian democratic set up. He refers to trends in Muslim education during the British period and to the views of prominent leaders belonging to different political parties.

The work undertaken by Sharma logically leads to a comparative study of Muslim and non-Muslim students of similar socio-economic background and of the same neighbourhoods. The data indicate that the Muslim student is poor. He/she lives in a house which is a rented one, and not owned by his/her parents. (More non-Muslim students live in houses owned by their parents.) The Muslim students' parents are illiterate (the percentage of illiteracy among Muslim parents and non-Muslim is 33.6 and 30.6, respectively). His/her parents *do not get* proper and adequate representation in services. However, in business their percentage is slightly higher. The number of Muslims who are neither in government jobs nor in business is higher compared to the Hindus. The Muslim student has no access to newspapers at home, comparatively speaking. He/she does not have a separate room for study. He/she gets less regular assignment of home work. He/she has to cover a longer distance and spend more time in reaching the school. He/she is late in finding entry to school. The data also show that the Muslim student devotes one hour daily to his/her study tham his/her counterpart. He/she is of higher intelligence. At the secondary level, the Muslim student is in an advantageous position as he/she gets more private tuition compared to the non-Muslim students. In matters of home-task checking and overall use of library, the Muslim student has an edge. Compared to the Hindu student, the Muslim student's performance in English is better. The Muslim student's parents get higher representation in private service and in self-employment. They evince more interest in his/her educational progress and frequently visit schools. The Muslim student has a good collection of library books at home. There are more medical facilities available to him/her in the school.

As regards the Muslim teachers, they are somewhat better qualified and have better housing facilities. But they lag behind in experience and in-service training.

The data collected by Sharma do not conclusively prove that the Muslims are far behind in utilising educational opportunities. In fact in certain matters, Muslim students excel their counterparts from other communities. Sharma fails to offer a proper explanation of the realities of the situation partly because of a faulty approach to his problem and poorly conceived theme and partly because of lack of perspective necessary for the analysis of the data. His references to the history and educational traditions are not properly integrated with his scheme of study and lead to confusion rather than to the understanding and proper appreciation of the laboriously assembled data. After the advent of the British the Muslims were not educationally backward as the Muslim leaders made us to believe. In some provinces they were quite advanced. In Punjab, NWP, Oudh, Madras, Bombay, Central Provinces, etc, the number of Muslim scholars was higher in proportion to their population. In Eastern Bengal, however, they were particularly backward because of poverty and low social position. Sharma does not point out the reasons for the educational backwardness of the Muslim in certain regions. Surprisingly he does not even mention the works of Anil Seal,[1] and Paul Brass[2] who have discussed this theme in greater detail. Sharma fails to correlate the 19th century Muslim educational situation with the British colonial posture and the predilection of the Muslim elite for politics to the extent of ignoring other aspects of socio-economic life.

Secondly, Sharma does not have adequate understanding of the character of the Indian State. He is aware of the importance of this aspect and its bearing on the education of the people but he refers only to certain Articles of the Indian Constitution which indicate the secular policy of the State. He also tells us that Muslim minority is not satisfied with the type of secularism obtaining in the country. A comparison between the British approach to Muslim education and that of the present ruling class would have been quite useful. But one wonders whether certain measures like instituting special fee concessions and exclusive scholarships or extending liberal grant in aid for establishing schools or colleges amount to secularism or communalism. In this context all the points raised by Sharma become meaningless. Comparing the educational situation of the sons and daughters of manual workers (Hindus) with those of poor businessmen and self-employed (Muslims) amounts to comparing incomparables. A more fruitful comparison would be between those who belong to the category of the ruled and those who dominate the state and society. There

is no real contradiction between the poor Hindu and poor Muslim but there is between the poor and the rich irrespective of community. Neither Sharma nor Rasheeduddin Khan (in his otherwise brilliant introduction to the book) refers to the class character of the Indian State. Both tend to agree that in 'secular' democratic India the minorities are bound to suffer. Why? Not because the minorities are numerically insignificant. The reason, as described by Marx, is that the bourgeois democratic state allows "privately property, education, occupation to act in their own way, i e, as private property, as education, as occupation, and to exert the influence of the *special nature.* Far from abolishing these distinctions, the State, only exists on the presupposition of their existence..."[3] Such a State, whether in the United States or in India, cannot do justice to the minorities. It has been pointed out by the economists and sociologists that in the United States discrimination against ethnical minorities annually brings the monopolies at least 30,000 million dollars in super profits.[4] The greatest beneficiary in the Indian system is the industrial-landlord-military-bureaucratic combine. Poverty, illiteracy, injustice and exploitation are inseparably linked with each other. Rasheeduddin Khan's reliance on the 'maximal' or 'total' Indian State or on the pluralistic and segmentary nature of Indian society is positively dangerous as it conceals the main contradictions of the system. Neither Rasheeduddin Khan nor Sharma attempts to develop a framework for the study of minorities' education in terms of availing of educational opportunities. After all, education is part of the ideological State apparatus and an important element of hegemony. None of them gives primacy to the economic system in determining the role of education and its relationship with social and class relations.

Champaran in Historical Perspective

N Benjamin

Agrarian Problems of Permanent Settlement: A Case Study of Champaran by Girish Mishra; People's Publishing House, New Delhi, 1978; pp xiii +354, Rs 55.

CHAMPARAN holds a unique place in the political and economic history of India. It was one of the first districts to feel the impact of Gandhi's mass movements. A thorough study of this region was long overdue. Mishra has done well in undertaking it. But the way in which he has proceeded leaves much to be desired.

After a short 'Introduction', Mishra discusses 'the zamindars of Champaran'. He says that when Cornwallis arrived in India in 1786, "Both the zamindars and raiyats were suffering from poverty and misery and *the only section of the society flourishing was the moneylending community*" (p 6, emphasis added). The latter part of the statement is too sweeping and the author has not produced any evidence to substantiate it. He describes Cornwallis' reasons for the introduction of the permanent settlement system. Apart from the other reasons which are usually given like agricultural development, punctual payment of government revenue, etc, Mishra says: "His belief was that zamindars, as a result of their continuously increasing income, would import British goods. Thus the market for British goods would expand" (p 301). The point made is interesting, but its authenticity is doubtful, for previous authors have not made it and Mishra has not given his source for it. In fact, Mishra has made it in a passing manner in the 'conclusion' of his book and not in the chapter on the zamindars.

The author notes that when the permanent settlement system was introduced in 1793, there were only six zamindaris in the district. Owing to the operation of the 'sunset law', partition of estates and resumption of lakhiraj grants, the number of estates gradually increased till it became 1,548 at the time of the abolition of the zamindari system. Originally the government land revenue demand was fixed at a very high rate. On p 8 Mishra says that it "was generally fixed at ten-elevenths of the existing rental..." But on p 15 he contradicts himself and writes, "In the beginning the margin of profit allowed to zamindars... was generally one-tenth of the government revenue..." The author justifiably deals with the indebtedness of the zamindars. This was the result of their extravagance. For example, "... Fateh Bahadur Singh had spent lavishly on the marriage of his son Shamsher Bahadur Singh and had indulged in idiosyncrasies like sweetening the water by putting sugar in wells falling on the way from his place to that of the bride" (p 44).

Chapter III deals with 'intermediary tenures'. Mishra attributes their emergence to the absenteeism of the zamindars, desire of the well-to-do people to make speculative investment in land and to acquire the status of the zamindars, etc. These tenures were held by both Indians and Europeans. The latter were interested in indigo cultivation. On p 71, the author gives details of the budget of an indigo factory as found out by Watt. But the year to which the data relate has not been mentioned.

Mishra then deals with 'commercial agriculture'. The most important commercial crops sown were poppy, indigo and sugarcane. Of all these crops, indigo brought maximum notoriety to Champaran. It was mostly grown by the cultivators for the planters. After receiving same advances, the former bound themselves to cultivate it on specified portions of their fields. The price paid to them for it was not determined by market forces, but was kept artificially low. The system had some other demerits also. Referring to the advances provided by the planters to the peasants, the author observes. "The purpose of the advances given by the new credit group... differed from the advances supplied by the moneylenders and the grain dealers. The main difference was that the former had the sole purpose of securing the supply of the commercial produce of the peasant while the latter aimed at securing higher rates of interest and if possible grabbing the land of the peasant" (p 121). This statement is clearly incorrect. The moneylenders were also traders and so there is no reason why agricultural produce should not have interested them. In Table 4.5 on pp 100-01, the author has given total output and value of indigo produced in Champaran during 1872/73-1909/10. Instead of quoting the raw data, it would have been better if he had presented them in the form of index numbers. Mishra has also tried to calculate the total amount of money put into circulation in the process of indigo cultivation and dye manu-

[illegible]. He estimates that "between Rs 50 lakh and Rs 1 crore was put in circulation every year in this process" (p 107). But this estimate is rather inflated for the cultivators were generally forced to grow indigo. Given freedom of decision, they would have certainly grown some other crops which would have brought additional money into circulation in the district.

Mishra then describes 'the peasants'. He says that as in other permanently settled districts, the zamindars gave the peasants neither pattas nor receipts. As a result, most of the peasants were like tenants-at-will. The institution of patwaris, which was expected to bring about an improvement, proved ineffective.

This is followed by a detailed discussion of the 'rural economy'. The structure of the society, crop acreage, famines, prices, rural credit, etc, are covered in this chapter. As regards the rent-free landholders, Mishra writes, "their share in the total occupied area of the district went down from 2.10 per cent to 1.30 per cent" (p 200). He does not specify the years to which these figures relate. Nor does he account for this change. It may have been the effect of the extension in the area under cultivation. Likewise, he notes, "the rent-free tenures increased from 14,140 to 19,878 (sic) leading to a decline in the average size of the rent-free holding from 2 acres to 1.03 acres". The author does not attempt to explain this change. Perhaps inheritance had something to do with it.

Chapter VII covers 'agrarian agitations'. The pride of place naturally belongs to Gandhi's campaign against the indigo planters in 1917 which led to the enactment of the Champaran Agrarian Act, 1918.

Mishra has relied in a big way on the survey and settlement reports of Sweeney and Stevenson-Moore as his sources. His references to the Famine Commission are confusing for although more than one Famine Commissions had submitted reports, he has often neglected to give the identifying years. True, he has consulted manuscript records. But in many places they have been referred to clumsily in the footnotes as 'Bettiah Raj Records' and 'Motihari Collectorate Papers'. Mishra should have given some more details like the file numbers, etc, to facilitate the work of future scholars. He has presented tables which can hardly be considered relevant. Similarly, there are extensive quotations (e g, the one on pp 130-31) which are redundant for the author has already given the information which they contain in his own words in a short and neat manner. But the maps, glossary, list of important agrarian regulations and acts, and index are useful.

Books in Brief

Say Not the Struggle : Essays in Honour of A D Gorwala (Second Edition); Oxford University Press, 1976, pp 392, Rs 60

ASTAD DINSHAH GORWALA is, in a way, an institution by himself. In the darkest days of Emergency he (along with a few others) continued to fight for the cause of honesty and morality in public life. The birth, death and the rebirth of his publication *Opinion* amply evinces his utter devotion. Gorwala personified in his career as a civil servant the ideal administrator, uncorrupt, sincere, a true servant of the people with a deep sense of justice. Throughout his life he has been a fighter in the cause of democracy. Thus he has had the courage of his convictions to reprint, after Morarji Desai became Prime Minister, extracts from two of his previous articles criticising Morarji Desai for nepotism and want of integrity.

"Say Not the Struggle" has several outstanding essays by experts on political science, administration, economics, sociology, education as well as personal accounts of associations with Gorwala. More fascinating in the Second Edition is the Appendix which offers seventeen selections from *Opinion* published during Emergency and many of which are relevant even today. There is now greater need for such journals as *Opinion* whose aim has been "the service of the Indian people through the offering of sound comment on all aspects of public life". In fact it would be a good idea for daily newspapers, radio and television to periodically reprint (or broadcast) articles from independent periodicals such as *Opinion*

— S I Clerk

Indian Book Review Index, 1975-76, compiled and edited by A R Sethi and H M K Moodgal; Indian Documentation Service, Gurgaon/New Delhi, 1978, pp xvi+123, Rs 80.

THIS is a bibliographical compilation of reviews of books published in 1975 and 1976, appearing in selected Indian and foreign journals during this period and upto June 1977. In the words of the compilers, what are listed are reviews of "books of Indian authors in English language published in India or abroad, or written by foreign authors on India and published in India or abroad. .". Thus, any book written by an Indian author, even it can be of no interest to anyone, would merit notice if it is reviewed. While reviews of undoubtedly seminal works by foreign authors even in Indian journals will not merit inclusion unless the book also happens to be "on India". It is difficult to justify these 'qualifications' for inclusion; the basis for selection should have been the relevance of the subject of the book and its review in a standard journal, not the nationality of the author or whether (in the case of a non-Indian author) the book is "on India".

Making a quick check of the entries in the Review Index with the files of this journal, one finds that even within these limits, not all the published reviews have been covered. For instance, *EPW* published two reviews of Ashok Rudra's book, "Indian Plan Models", in its issue of February 28, 1976, while the review by Joan Robinson is mentioned, the one by Lance Taylor is not. A graver oversight is the entry relating to the review of two books written jointly by Myron Weiner and John Osgood Field. *EPW* carried two reviews of these two different books, one by Ghanshyam Shah (October 11, 1975) who reviewed the authors' "Electoral Politics in the Indian States: Three Disadvantaged Sectors" and which the compilation correctly takes note of; but under the same entry, another review by G K Lieten (*EPW*, June 19, 1976) of an entirely different book by the same authors ("Electoral Politics in the Indian States: Party Systems and Cleavages") is also mentioned. In fact, the index entry under Myron Weiner itself seems inexact since it makes reference to an entry (581) where no book by Weiner is mentioned.

There is little reason for the apparent rigidity of the compilers' time-frame in taking note of books published only since 1975. For instance, in 1976 the State Bank of India reprinted the three classics on Indian Banking by J B Brunyate, Charles Northcote Cooke and G P Symes Scutt, and the books were taken note of in *EPW* (June 26, 1976); but the compilation does not mention the reprints or the review even though the 1975 reissue of another classic, "The Chamars" by George W Briggs first published in 1920 and its review in *EPW* (June 12, 1976) is, quite properly, taken note of.

There is some scope for revising the selection of journals reviews appearing wherein are taken note of; there is no reason, for instance, for not taking note of reviews published in journal like *Frontier* (Calcutta) which has consistently published book reviews of the highest quality.

Progressive State Governments

An Assessment of First Communist Ministry in Kerala

Georges Kristoffel Lieten

The debate on the possibilities and desirability of leftist state governments is on again since the spectacular victory of the Communist Party of India (Marxist) in West Bengal and Tripura. The assessment of leftist state governments is usually based on ideological predispositions and not on a careful analysis of its acts of commission and omission.

The present article is meant to give an idea of the first communist ministry in Kerala. Generally the conclusion is a positive one, since real progress was made in various fields. The overthrow of the Namboodiripad ministry, however, undid many of these positive steps, though not all. The high level political consciousness in Kerala and the constant political and trade union pressure on the ruling classes could not be undone.

THE Communist ministry in Kerala of 1957-59 was the first of its kind. It thus lacked experience, and was bound to breed some undue illusions about the possibilities of real structural reforms. This illusion was fed by the reformist, Nehru-minded wing in the then still undivided communist party. Up to now, all leftist state governments have had a different character, and so each has to be assessed in its own right.

The Marxist debate in India is strongly related to the strength of the communist movement which forms so to say its material basis. It is therefore no surprise that the perhaps unexpected but in any case tremendous victory of the CPI(M) in Bengal and Tripura should stir marxist intellectuals into renewing the debate on the scope and the ideological predisposition of communist state governments.

In a sense this is welcome. The existence of communist-led state governments carries with it the danger of excessive reliance on new possibilities of executing structural reforms in the system, of breeding undue illusions of a peaceful path of ever-increasing changes and ever-extending influence in other states. Between the 'opportunist' reliance on the ruling party and the actually 'left infantile' belief in the barrel of the gun only, lies a whole range of possibilities. Basically, of course, the possibilities are contained within the strategic understanding of state power and thus the nature of the stages of the revolution, but tactically a communist party will leave no single chance unused of scoring victories for the toiling people.

Such a predisposition can theoretically lead to an opportunist position — of imagining that the ruling classes at the Centre can be relied upon tactically in the realisation of bourgeois-democratic reforms, and that the policy to be followed should be such as to avoid conflicts with the Indian state. The Achutha Menon ministry in Kerala (1969-77) does not fall under this category, since the CPI relied strategically on Indira Gandhi and the Congress as the presumed representative of the national bourgeoisie. The present co-operation of the CPI(M) with Janata is not a strategic but a tactical one, moreover limited to the restoration of democratic rights.

It is not clear which theoretical position — strategic or limited tactical co-operation — Ashok Rudra attacks in a contribution to this journal. According to him, the communist parties are "the guardians of the law and order of the bourgeois-landlord state", who "stick on to the state government power for as long as possible *just for the sake of it*" with the purpose "of protecting and promoting capitalist and landlord class interests".[1] The arrogance of Ashok Rudra is painful. Progressive and heroic Bengal which had been bloodily repressed for the last six years (as a result of the left's own mistakes, in the assessment of Rudra) has continued to exist and organise for all these fascist years. Peasants, workers and middle classes in Bengal remained with the CPI(M) and its allies. This lasting support does not fit into the ideas of Rudra, and he therefore turns with utter contempt against Bengal's progressive people by saying that their only lasting quality is their uncritical and unquestioning loyalty to the leaders, similar to the "life-long loyalty of the supporters of East Bengal and Mohun Bagan for these two football clubs".[2]

Rudra condemns the communist movement in India for observing conspicuous silence over the experiences of communist participation in state governments: "they have never recognised the errors committed and drawn lessons from them". But Rudra does not give any facts to underpin this attack; he does not himself analyse the experience concretely, and, therefore, should have given the other side at least the benefit of doubt, as is common among friends, instead of indulging in utter denunciation.

Vantage Position

It is true that no indepth study has been made yet of the performance of left front state governments. Till that has been done, radical slogan-mongering against the attempts of the progressive forces in those states to bring some relief to the people will continue to get hold of progressive minded intellectuals who generally do not have much understanding of the dirty work in the political field and prefer to relate statistics and isolated pronouncements to their own theoretical, idealistic expectations. In any case, it is not true, as Rudra asserts, that the communist movement has observed "conspicuous silence" over the experiences gained. At certain stages the criticism even came into the open so that also those Marxists who are not in the communist movement could have acquainted themselves with it.

After the split the Communist Party of India (Marxist) reconsidered some of the ideological positions in regard

to the participation in state governments. The vantage position at the head of the administration should be utilised to give the people whatever limited benefits are possible, while at the same time helping the advancement of the mass democratic movement against the bourgeois-landlord set-up. Expectations about big changes were considered unwarranted since "state governments under the present set-up have neither real autonomy nor adequate powers to undertake any radical and really effective measures of relief and reform".[3]

The Political-Organisational Report of the CPI(M) in December 1968 put it in clear terms:

> In a word the United Front Governments that we have now are *to be treated and understood as instruments of struggle* in the hands of the people more than as governments that actually possess adequate power, that can materially and substantially give relief to the people.
>
> In clear class terms, our Party's participation in such governments is one specific form of struggle to win more and more people, and more and more allies for the proletariat and its allies in the struggle for the cause of People's Democracy and at a later stage for socialism.
>
> It is for our party . . . to understand the fake character of the power invested in the state governments, and strive to treat them and understand them more as instruments of struggle in the hands of the people than be led into the reformist delusion that they have either adequate powers or they can substantially give relief to the people.[4]

The CPI(M) in the late sixties was not alone in the government. The "instruments of struggle" were co-shared with united front partners as the CPI and Bangla Congress which saw them rather as "instruments of better administration". The compromise with the partners in Kerala initially went further than the Central Committee of the Marxist party could accept: the Kerala unit "instead of critically exposing the parties and groups in the united front which were opposed to unleashing a powerful movement unitedly drifted for too long, involved in top-level talks and the delaying tactics of certain leaders of other parties in the front."[5]

The West Bengal state unit of the CPI (M) on the other hand was praised by the CC for striving to implement the understanding given by the party. Both the united front governments in the late sixties were used as instruments of struggle and the election figures (from 18 per cent in 1967 to nearly 34 per cent in 1971)[6] show that it gained support from the poor and democratic masses in the state.

In the process, however, the communist party was caught on the other foot. Left radical elements, with illusions about the revolutionary fervour of the masses and about the weakness of the Central government to intervene and suppress the revolts, started the attack on the 'neo-revisionist' policy of the CPI (M). Ultra-radical petty-bourgeois youth were soon joined by anarchistic lumpen elements, infiltrated and supplemented by Congress goondas. From 1971 onwards a semi-fascist regime of terror was let loose against the progressive and democratic movement, particularly against cadres and sympathisers of the CPI(M) and CPI (ML).[7]

The marxist party has buttressed itself ideologically and organisationally against revisionist tendencies, but had taken insufficiently into consideration the danger which loomed from the left. The present Left Front Government has learnt from that experience and moves ahead cautiously but skilfully. It has already taken a number of steps which will fairly lessen the misery of the people, remove certain glaring injustices, implement a number of bourgeois-democratic reforms and release the democratic energy of the people.

Kerala, 1957-59

We propose to study here one case in which the communist party on its own ran the administration of an Indian state. The Kerala Government from 1957 till 1959 carried with it some peculiar aspects which differentiates it from other leftist state governments. It was the first time that a communist government was installed with authority over an Indian state, and it was quite normal that due to a lack of experience, mistakes were committed, and that the new possibilities stimulated high expectations whereby cautious voices were less readily listened to.

In the second place, the CPI was still undivided. A significant group within the party around Dange, Joshi, Yusuf, Mohit Sen, Bhowani Sen and others cherished an increasing faith in the progressive nature of Jawaharlal Nehru, and assumed he could be relied upon in the defence of the leftist ministry. An optimistic faith in the newly emerging theory of peaceful transformation within the world communist movement was coupled to the belief that a healthy people's government would be able to compete honestly with Congress governments in other states and open the eyes of the electorate in other parts of India.

A directive of the Politbureau in July 1957 even confirmed that "Parliament and the State Legislatures have become the most important forums of fighting for the cause of the people and the country".[8]

In the mid-fifties opinions were expressed about a leftward swing among Congressmen with whom the CPI should be able to join hands in the common fight for the implementation of the progressive slogans and the progressive resolutions of the Congress (e g, the socialistic Avadi resolution). At the Palghat party congress in April 1956 as many as one-third of the delegates advocated *a general united front* with the Congress.[9]

The Fifth Party Congress at Amritsar two years later concluded that there was much common ground for action around Nehru's progressive plans.[10] Not everybody in the party took the same position. Usually criticism of the official party line was reserved for intraparty discussions. During the 28 months of the ministry it rarely came into the open, though on some occasions it did.

The official ideological stand of the party that the central government, thus the state power, could be relied upon resulted in a number of illusions and soft approaches on behalf of the Kerala government, as we shall elaborate later. But, again, not the whole party had the same understanding. At one time the National Council, meeting in Madras in October 1958, even took exception to the general optimism, and asserted that the actual trend had belied the hopes of an easy course.[11] The remark of Bhupesh Gupta, then still in the leftist camp, that "it is mass struggles and mass actions that decide the major issues in bourgeois society"[12] became partially implemented in Kerala though what he termed revisionist opportunism co-existed with it, and was actually strongly represented in the state leadership.

Both these elements of the first Namboodiripad government — inexperienced confrontation with a new situation and the hold of the Congress-minded communists on the ideology of the party — were bound to expert a rather negative impact on the range of virtual possibilities. The actions and inactions of this government, nevertheless offer an interesting point of reference as to what can be achieved. We

shall dwell upon administrative reforms, the industrial policy, labour relations, the agrarian policy and the superstructure.[13]

Administrative Reforms

Lenin characterised one of the fundamental questions of the revolution as follows: "The entire history of the bourgeois parliamentary countries shows that a change of ministers means very little, for the real work of administration is in the hands of an enormous army of officials. This army, however, is rotten to the core with a non-democratic spirit, it is connected by thousands and millions of threads with the landlords and bourgeoisie, and is completely dependent on them. It is a terrible illusion, a terrible self-deception of the people to attempt, by means of this state apparatus, to carry out such reforms".[14]

Chief Minister Namboodiripad struck the same note when he realised that the socio-economic development of the state was impossible until "basic transformations are made in the existing administrative system, for the present system, handed down to us from the erstwhile British rulers and their Indian allies, is inefficient, while it is unjust and oppressive in its relation to the basic masses producing the wealth of the country".[15]

The translation of this position into practice, however, proved to be extremely difficult. The main difficulty was that the state apparatus actually could not be touched on constitutional grounds. This remained a very touchy subject during the whole period of the ministry. Allegations about subversions by the so-called extra-constitutional communist state government was among the major weapons the opposition parties used in the overthrow of the government.

In this context the government by and large preferred to put up with the existing machinery without a stringent check on its deleterious features, which H D Malaviya, sympathetic to the ministry, acknowledged in mid-1958: "Thus far the communist government has failed to achieve any significant success in remoulding this machinery and taking it out of its old rut to any considerable extent."[16] In fact the state conference of the CPI in January of the same year had also seen sharp criticism of this failure.

One initiative in the policy of 'democratic decentralisation' was the Administrative Reforms Committee. The report proposed as one of the guiding principles the delegation of "greater and greater authority to the lower ranks of the administration consistent with the necessity for centralisation in matters of broad policy".[17] This resulted in some changes, among others the introduction of the Panchayat Reforms Bill,[18] though in general the administrative structure was not made a mass issue, as it became increasingly in the late sixties when the people were asked to keep a check on the administration and institute committees to help in the implementation of policy.

Industry

The achievement of rapid industrial progress was one of the most important targets. Ajoy Ghosh, the national secretary of the CPI, described it as "the task of rebuilding Kerala", and, therefore, called for the co-operation of workers and capitalists".[19]

But even before the Government could start along this path, a controversy between New Delhi and Trivandrum had developed. The communist party had announced that if it came to power it would nationalise the foreign-owned plantations in Kerala. This was immediately objected to by the Congress, more particularly by the Prime Minister, who declared that for the sake of getting a few crores of rupees what was at stake was the honour of India: "I am not going to tamper with the honour and good name of India just to gain a few crores of rupees."[20]

In his press conference on the day after the announcement of his party's victory in Kerala, M N Govindan Nair, faced with the objections of the Centre, stressed that it was not his party's intention to do anything beyond the constitution. Some days later EMS declared: "Our proposal with regard to the taking over of foreign plantations is so reasonable and so essential for the development of the economy in Kerala that we have every hope that we can, through consultations, convince the Centre of the necessity for the same." He however continued, that "if it is found in the course of actual implementation... that provisions of the constitution do not allow the implementation of a particular item in the manner in which it had been formulated, we would hold further consultation with the Centre and do our best to implement as much of it as possible within the framework of the Constitution".[21]

Thus, though for the CPI the nationalisation of the plantations had been an essential premise for the economic development of the state, neither the party leaders nor the communist government started an ideological fight with the Congress government in New Delhi. As such this whole episode is a practical example of the professed adherence to the constitution. Indeed, the central decision was accepted as clearly outside the limits imposed by the Indian state power. This was accepted, said Govindan Nair, for, "while everyone realises that we cannot create a revolution in Kerala by working the constitution, there are possibilities of doing some good to the people. If we work the administration without corruption, and when the people realise that all the propaganda directed against us by various agencies is false, we will be able to get the confidence of the people elsewhere in this country also".

For this confidence, after all, a noticeable progress in industrialisation was needed. This should be attained with the help of private capital. After being summoned by the Governor of Kerala, EMS declared that his policy as the Chief Minister would not be to establish a socialist society. Businessmen and traders would be encouraged, but at the same time the government would curb their tendency to excess profiteering.[23]

The new minister of industries, K P Gopalan, added that they would provide all kind of facilities: the industrialists would get a "reasonable profit, but also the workers should get a reasonable share of the profit".[24]

The government desired that a number of industries should spring up in the private sector, and was prepared to offer maximum credit facilities and, if necessary, to participate in the share capital of the concerns. The participation was mainly in national firms investing in Kerala, though in the case of a Japanese cable factory shares in a foreign firm were also bought.[25] The nationalisation of industries was limited to the Water Transport Corporation, which took over the ownership of the passenger and cargo motor-boat services with some 1,500 workers.

One of the private owners who decided to invest in Kerala was G D

Birla. The decision of this monopoly house to invest in a communist-dominated state was expected to act as a forceful example for other Indian industrialists. After five days of office, K P Gopalan informed the press that Birla had proposed to open some industries. Some days later Birla confirmed that he was planning to start a pulp factory in the Nilambur forest area. The initiative, however, had been taken before the communist election victory. More than one year later only a complete agreement on the setting up of the factory and the rights and responsibilities of the management were reached. The agreement specified that the management had powers "to plan, direct and control the operation of the plant and to make rules and regulations for the purpose of maintaining discipline, order, safety or effective operation of the company's work. Wages on a scientific basis [are] to be prepared by the company and bonus will not be related to the company's profit but only to efficiency of production."[26]

The CPI itself came out openly in disapproval of some of the provisions in the agreement, and so did the AITUC. This indicates that, though a communist-led state government may be compelled to sign the usual agreements on rights and powers of the private management, the communist party and its mass organisations are not led by the same compulsions, and are free to fight clauses of the agreement.

Industrial Progress

When EMS Namboodiripad took office, the Second Five-Year Plan was already in its second year. The share of the state in the Plan was Rs 87 crores, as compared to the minimum of Rs 200 crores the party had put forward in its election manifesto, a demand which was later brought down to Rs 130 crores. The government decided to shift as much resources as possible from non-productive to productive sectors. Due to the planning priorities of the previous administration in Kerala only 8 per cent had been earmarked for industrial development, compared to the all-India figure of 18 per cent. In the assessment of Namboodiripad, his predecessors had been more interested in the construction of a street or a school in their constituency than in the planning and implementation of a rational industrial policy.[27]

Although the communist ministers did not have experience in the working of the state administration and had no hand in the drawing up of the plan, their record in the first year was already much better than the Congress performance during the previous years. Most striking were the sectoral differences. Most vital resources needed for the development of food production were previously diverted to transport and communication, as well as to the miscellaneous sector, which got overfulfilled by 400 per cent, while the fulfilment in the sector agriculture was only 44 per cent.[28]

The global plan fulfilment rose from 58 per cent in 1956-57 to around 100 per cent in the second year of the communist ministry, and dropped again to 86 per cent during President's Rule.[29]

The estimated targets themselves show for each year a marked difference between the two sorts of government. The figures in Table 1 clearly demonstrate the progressive raising of the targets in each sector, as well as the achieved results which at least doubled in all fields except irrigation and power. It is significant that during the administration of the anti-communist government which came afterwards again there was a sharp decline in plan fulfilment.

These achievements were, moreover, realised on a sound budgetary basis. Although the government had abolished sales tax on commodities of daily consumption like food, dried fish and books, it could raise its income considerably through agricultural super-tax and surcharges on less needed commodities — thus through more direct and less indirect taxation. Consequently, finance minister Achutha Menon was able to introduce his first budget as a surplus budget at a moment that the other Indian states together had a total deficit of Rs 77 crores.[30] The actual spending gap of all states amounted to around 37 per cent of the total expenditure.[31]

The resulting industrial changes were clearcut.[32] In employment, under the communist ministry the aggregate man-days worked went up from 324 lakhs in 1957 to 476 lakhs in 1958, followed by only a small increase to 489 lakhs in the next year when the ministry was dismissed. The number of average daily workers went up from 1,07,629 to 1,65,822 and 1,68,400 respectively, which indicates that the existing industrial potential was put to fuller use. This promising trend was reflected in the employment expectations of the lakhs of unemployed Malayalees: in 1958 an average of [illegible] employment seekers got themselves registered per month compared to less than 6,000 in 1957 and 8,900 in 1956. This huge demand for jobs, however, could not be satisfied and the size of the Live Register of the Employment Exchanges rose from 69,915 to 1,33,661 by March 1959. Respectively, 201 and 121 people got registered for every clerical post and unskilled job. Incidentally, another indice of the government's support among the people is provided by the success achieved in the small savings scheme: the gross collection in one year increased from Rs 370 to 460 lakhs, which resulted in a doubling of the net savings. Thus the unemployment register increased in spite of the increase in not only the number of the working days but also in the number of jobs. The increase in the number of factories was even higher: from 1,613 to 2,128 and then to 2,275 which means that in 1958 the number of factories increased by 30 per cent. As is shown in Table 2, factories, though with relatively small employment potential, were opened not only in the traditional sectors as rice and oil mills, textiles, coir manufacturing, printing, splints and veneers, and rubber goods, but also in motor repairing, general engineering, tyre retreading, artificial manures, forgings and shipbuilding.

No doubt the financial assistance provided by the Kerala government gave forceful support to economic development. Of all Indian states, Kerala topped the list of the amount of loans to the small scale industries. Afterwards, from 1960 onwards, a sharp drop occurred. No longer was substantial financial assistance given to small scale industries at great risk.[33] That the government was not able to solve all acute problems is, for example, born out by the fact that the industrial dispersal was not promoted in this period. The concentration of industries due to external economies persisted, mainly in the two belts of Ernakulam-Alwaye and Quilon-Kundara. Only 10 per cent of the state loans was sanctioned to Malabar, and even a much lesser percentage of Malabar's demand for raw material was granted.[34]

The centrally initiated industrial estates in Papanamacode and Kollakadavu also did not produce the expected industrial initiative, and while quite a number of sheds were occupied by the government for unproductive purposes, in many other sheds the units were practically inactive, except for the receipt of monthly raw material quota, which

could afterwards be sold in the black market.[35]

Labour Policy

The CPI had promised an immediate increase of 25 per cent in the pay packet of the workers if it came to power. This was, obviously, a bold promise which for the government, in view of its policy towards the prospective capitalist investors, seemed to be of doubtful practical value. This situation for the government's own payroll, however, was different. Government's policy in this respect showed a clear option in favour of the lower strata. We shall deal first with the wage reforms, and further we shall take up the subject to the labour movement.

Less than two weeks before the election in Kerala the government employees were given a considerable wage increase. Three days after coming to office the Communist ministry passed a stay order for the wages of the gazetted officers, freezing them at the original limit, in a bid to iron out the extreme differences, and increased the wages of the labourers in government commercial undertakings considerably.[36] Finance Minister Achutha Menon announced in July 1957 the institution of a pay commission in order to rationalise and adjust the pay structure. In the meantime the wages of various other low-paid government employees were enhanced. An American journalist reported that the Communist ministers put up quite a show in this respect: While the pay of village headmen was ostentatiously raised from 6.75 dollars a month to almost 11 dollars a month, they cut their own pay from 155 to 72 dollars a month.[37]

The bonus in the state services was fixed at 8 per cent as deferred wages plus an additional 5-8 per cent based on the income of the department. The principle of bonus as deferred wages was consistently applied in the factories, services and workshops. Government informed that "bonus paid was neither an incentive bonus or a profit sharing bonus, but purely an exgratia bonus". They added that "refusal of bonus to the workers was likely to lead to discontent and that bonus was being allowed even in certain other government commercial concerns working at a loss".[38] Incidentally, this principle was severely attacked by the Union Minister for Industries, Morarji Desai, who concluded that "The first problem is for people to be kept alive. Then alone will arise the second problem: to make them prosperous."[39] Bonus thus paid by the government shot up from Rs 52,000 in 1955-56 and Rs 57,000 in the next year to Rs 83,307 in 1957-58.[40]

In June 1958 the recommendations of the Pay Commission were published. Upon implementation wages of lower paid government employees got increased by 15 to 100 per cent.[41] Another policy in favour of the working class was the decision to provide discharged workers with 50 per cent of their pay when they were dismissed on questionable grounds pending the adjudication or arbitration of their disputes with the employers.

Sources: The Indian Labour Statistics, December 1958, "Abstract of Labour Statistics of Kerala", 1970.

The wage increase policy for private industries and agriculture was less easy to implement. Some industries had already been brought under the Minimum Wage Act, and during the 28 months that the CPI was in office, the scheme was extended to 12 more industries: cashew, tile manufacture, timber industry, toddy tapping, agriculture, printing presses and others. This list of statutorily fixed minimum wages became far more comprehensive compared to the rest of India. Though the per cent increase over the existing wage scale was small, the total increase resulted in quite a substantial additional flow of money from the employer's pocket to that of his workers. The reaction was appropriate — as in the case of the 65 tile factories with 6,000 workers, which closed down in July 1958, one week before the minimum wages were to be enforced, and in the case of capitalist farmers and coconut garden owners who chose to engage other workers at the old rates, which resulted in frequent disputes and clashes with the dismissed unionised workers. It has often been alleged that the state apparatus elsewhere in India was either too weak or unwilling to implement the Government orders in this respect. Though it cannot be claimed that both factors had been overcome in Kerala, in the end it was possible that, helped by the party organisations, the information about their legal rights reached the workers, and these in turn could press the employers for the full implementation of the enacted reforms. This helped to ensure that the legal benefits reached the workers. An illustrative example of this feature is the amount of money given to female workers as maternity allowance. It is seen from Table 3 that the number of female workers applying for this benefit increased almost hundred per cent during this period. This indicates that at least in this field the Communist Party did not rely on the administrative machinery only, but succeeded in mobilising the people on the other side of the line to claim their legal rights and have them implemented by the state machinery.

It was observed that the wage policy gained for the communists much support among the lower strata of the population. They realised that this was their government, for it showed more concern for them than any previous government

This was the policy intended by the party, but it was not merely humanitarian concern for the poorest of the poor. Namboodiripad, in his critique of Indian planning, had attacked the mistake of neglecting the enlargement of the buying power of the people as a precondition for industrialisation. More employment and higher wages were to act as accelerators in the industrial development.[43]

Trade Union Movement

The wage reforms introduced by the government were only one aspect of the broad working class policy. This policy was determined by the objective and subjective conditions of the working class movement. One outstanding fact about the proletariat in Kerala was its high degree of organisation, the membership of unions being around three and a half lakhs in 1957. This is a remarkable high figure, even higher than West Bengal (1,76,894) and Tamil Nadu (2,14,676), and less than Bihar and Bombay only.[43] Actually, unionisation started quite late[44] but took huge strides under the communist government (see Table 4). The bulk of the workers were organised in the AITUC (38.5 per cent) INTUC (18.5 per cent) and the UTUC (16.3 per cent).[45]

Industrial peace was not forthcoming. On the contrary, there was an outburst of strife in some industries, mainly due to three reasons: the huge increase in lock-outs resorted to by many industrialists, the political agitation by Congress-led unions, and the opportunist attitude of the ex-Trotskyite RSP-UTUC leaders who tried to bypass the communist unions on the left.[46]

The incidence of time lost during strike waves remained high, especially as a result of two massive long drawn-out struggles in the plantations and the cashew industry.[47] What then was the specific line the various political parties adopted?

Obviously the unions which should have been more amenable to the propagated idea of industrial peace at this juncture were the communist trade unions, led by the AITUC. Before the CPI came to power these unions had been functioning as an economic and a political weapon. This role changed considerably under the communist government to the extent that strikes were less political, and were mainly made use of in order to help the government settle the issue. This explains why many strikes were of a short duration: subsequent to the warning given to the owners by the unions, a tripartite conference convened by the Labour Ministry would be organised if the managers were unwilling to negotiate with the unions directly. This pincer movement, after all, was never pressed too hard, for the Communist Party argued that till the real political and economic power was effectively in the hands of workers and peasants each settlement would represent some kind of compromise. In view of the relations of class forces and in view of the most imme-

diate tasks to be accomplished. It would be totally unrealistic to press for a socialist transformation and for the immediate accommodation of socialist labour relations. The constraints imposed by the actual historical context made it necessary for the Communist Party to move ahead cautiously and check the repercussions of all actions and demands in particular industries on the actual battle field.

This policy did not always favour the workers who were engaged in the actual disputes. The most illustrative example of the discrepancy between benefits for workers in a particular struggle and the exigencies of the general working class movement occurred *in July 1957 in the Kuttanad rice area*. Some 10,000 landlords in this rice bowl of Kerala threatened not to plant any paddy if the government allowed the agricultural labourers to have a free hand, ruling out police interference in the dispute. The initial reaction of the government was quite radical. The landlords were advised to implement *their earlier agreement* with the peasant organisation or face harsh government measures. *However, barely two days* later at a tripartite meeting chaired by the labour minister, T V Thomas, the landlords carried their point. Police patrols were posted in suitable places in order to make them available if a law and order problem arose. The landlords were given ample benefits as pumping subsidies, cheap electricity, insecticides, manure and bunding materials. In regard of wages and hours of work they were compelled to accept the rates recommended by the Minimum Wages Advisory Board, though they were given the freedom as to how many and which labourers they would engage, thus enabling them *to* disregard *the* more demanding communist labourers.[48]

The cautious attitude on behalf of the CPI can be explained in various ways. One can call it reformism, though this is a rather simple explanation characterised by a paucity of facts. One can also call it political expediency in view of the precarious food situation[49] and the long term class perspective. In the long run, indeed, the Travancore Agricultural Workers' Union was victorious.[50]

Another explanation for the sometimes too cautious attitude of the government is the powerful influence of a group of rightwing communists in the then still undivided CPI. K C Alexander in a study on emerging farmer-labour relations in Kuttanad draws the following picture:

"The early labour leaders were persons like T V Thomas, [illegible], S K Das, belonging to higher castes and rich families. Relatives of these leaders were prominent agriculturists in Kuttanad. These factors made the early leaders polite and reasonable in their dealings with the farmers. However, with the split in the communist party in 1964, the agricultural labour union in Kuttanad came under the leadership of the CPI(M). In contrast to the earlier leaders, the new leaders of the union belonged to the lower castes and the economically poorer strata." According to Alexander, the CPI(M) later rejected the tripartite Kuttanad Industrial Relations Committee because it was a class weapon "to corrupt, disorganise and cheat the working class"; therefore "the party's policy was not to boycott the wage boards and conciliation courts, but to carry on struggle to defeat their purposes."[51]

POLICE NEUTRALISATION

The *main dilemma for the government* was that the organs of state *power were not in its hands. Since* police machinery could not be used for the active defense of the struggle of the working class, the chief minister put forward the idea of the neutralisation of police, curtailing its interference in labour and land disputes. He expected that the owning classes who had been used "to the use of coercive power of the police in the matter of labour and agrarian disputes"[52] would *never acquiesce in an increased role of* the Labour Department and the resulting neutralisation of the police force in industrial disputes. The policy could not be implemented fully.

An official enquiry by Justice K Sankaran into the shooting of two UTUC workers by police forces at a cashew factory at Chandanathope, came to the conclusion the firing was totally justified, and that, generally, the spirit of defence against the law and order by the working class and students had to be effectively checked. The Chandanathope Report, moreover, blamed the government for being too soft in handling the political opponents, especially for the withdrawal of cases, which had become a common feature in the settlement of disputes. The government fully accepted the report and specified the police instructions in that light.[53]

Nevertheless, according to Namboodiripad, the very declaration of the new policy had an electrifying effect: mass struggles received a big impetus and a number of employers and landlords thought it prudent to give in to the demands.[illegible]

LAND REFORMS

It is an empirical fact that the agricultural population in India wants land and that the slogan 'land to the tiller' is therefore the appropriate slogan of the moment.

The Indian land reforms regulations make it possible for a left front government to implement this policy, although limitations imposed by the adherence to the Constitution with its provisions guaranteeing the inviolability of private property remain a difficult obstacle.

As has been noted in the United Nations sponsored study by K N Raj, from 1957 on "land reform became almost the centre-piece of the programme for social and economic progress in the state. Though none of the measures proposed or adopted for the purpose since then has gone beyond the proposals made for the entire country in successive five-year plans, the main difference in Kerala, compared to other *states in India, has been in the political environment* which has kept up sustained pressure on this issue".[55]

These, indeed, are two of the basic elements of Kerala politics: early comprehensive agrarian legislation and the constant mass involvement.

The government had opted for an anti-feudal and not for a socialist reconstruction of the agrarian system. Its limited purpose was to shatter the parasitic domination of the *jenmis*, andlords, intermediaries and money-lenders, and to make the tiller master over the land. It decided to implement the guidelines of the Planning Commission, but was not inclined to adopt piecemeal legislation, full of loopholes and nullifying provisions, as the Congress was doing in other parts of the country.[56] The Communist Party's recommendations took note of the fact that in the absence of stopgap preventive measures and of comprehensive safeguards, it would be a fallacy to regard the redistribution of land or the organisation of co-operatives as sufficient steps. The same old forces that had bonded and suppressed the rural population in the past would tend to circumvent all well intended legislation. The Kerala Agricultural Legislation Bill, therefore, was in itself comprehensive and, moreover, was preceded by a range of preparatory measures.

Expecting that the landlords, in anticipation of the proposed land reforms

[illegible]

[illegible], would take recourse to [illegible] eviction of tenants and ku[illegible] (hutment dwellers) in order to prevent them from getting such rights as proposed by the expected reform bill, the government imposed a *status quo*: "an effective law to stop the spate of evictions so much witnessed in other states despite legislation."[57]

The KARB was introduced towards the end of 1957. It had far-reaching implications in respect of ceiling (15 acres wet land per family), fixity of tenure to all types of tenants and ownership right which would automatically accrue to the tenant after payment of 12 times the contract rent. The resumption of land by owners was severely restricted. In no case could he resume more than fifty per cent of the surplus land of his tenant for self-cultivation; if the tenant possessed less than the ceiling area, the landlord holding less than five acres was free to resume a portion not exceeding half the area of the tenant and not raising the extent of land in possession of the landlord (now self-cultivating peasant) above five acres.

The KARB reduced fair rent drastically to between one-fourth and one-twelfth of the gross produce, depending on the fertility of the soil. All arrears by a tenant to his landlord were deemed to be fully discharged on the payment of one year's rent for small farmers.

The Bill was not upheld by the Supreme Court and was in a fundamentally changed form enacted by the Congress ministry in 1964. The precarious balance of power in the state made it necessary for even the Congress to press forward with land reforms. The reforms, however, were ridden with loopholes, took a long time in getting enacted so that preparations for evasion of the provisions could be sufficiently made, and were meant primarily to use as propaganda against the CPI(M). The land reforms in Kerala, therefore, today still represent a picture of failure.[58]

Characteristic for the land reforms introduced by the communist government was the involvement of the peasantry. The KARB contained a provision for the association of people's representatives in the implementation of the reforms. To this end, the constitution of Land Tribunals was envisaged. The bill was, moreover, circulated for eliciting public opinion. Peasants, irrespective of their party organisations, gathered in their respective villages, where they discussed the implementations and shortcomings of the bill. H D[illegible] called this popular participation in the discussion of the bill "something unique, a parallel to which can hardly be found in any other Indian state".[59]

This situation led to a strong reaction by the landlords. T K Oommen in his article on agrarian legislations and movements in Kerala has described the relations of power as follows: "The Communists of Kerala made tremendous efforts to mobilise the peasants and the workers in support of the Bills they introduced, but their efforts could not match the combined efforts of the local landed interests and the mighty constitutional weapons of the Union Government. Thus, even when a legislation is followed or paralleled by a social movement, the successful implementation of legislation depends on the nature and content of the opposition it faces".[60] This is a very apt description of the agrarian struggle by a non-marxian sociologist. It points out that the outcome of the struggle depends on the respective strength of the various classes in the actual constellation of federal India in which the ruling classes can always resort to the constitution as a final resort.

Superstructure

India has got a complex socio-economic formation in which elements of at least the feudal and capitalist modes of production are intertwined. This particular complexity is also reflected in the superstructure in which particularly the caste structure lingers on and is even made use of in economic and political activities

Communist parties in such a situation cannot possibly strive for the dissemination of a socialist consciousness. Actually, they are the only parties in India who do not include socialism in their immediate programme. In addition to their first and foremost action programme, the anti-feudal and anti-imperialist struggle, the immediate attempt is to throw off the ideological shackles of the old society. In Kerala this latter task has been fulfilled to a great extent.

Most scholars and commentators agree that the state had till very recently the most rigidly organised caste structure. Joan Mencher has attempted to give an ecological explanation for the proliferation of isolated subcastes in Kerala. Feudally organised primary units lived in an environment where it was possibly necessary to enforce more strictly the rules of distance pollution [illegible]: "In Kerala villages [illegible] was no complex organisation of village functions by caste which might serve as a means of affirming caste... Therefore, it might be suggested that the rules of intercaste pollution took the place of a complex village organisation as a means of affirming intercaste relations." Thus, it might be said that "the loose village structure in Kerala necessitated a more rigid set of rules for intercaste behaviour".[61]

Whatever its historical explanation, the caste system in Kerala remained very rigid till the fifties of this century. It was so rigid that a few commentators, particularly Selig Harrison, Miroslaw Fic, Ramachandran Nair and Tom Nossiter have even gone so far as to reduce all political activities in the state to a crude fight between political parties representing different religious and caste groupings.

Practically all other social researchers who have investigated the caste situation have come to the conclusion that the first Namboodiripad ministry formed a kind of watershed. Wherever the Communist Party was active, caste barriers declined. Intimate social contacts between Namboodiris and Ezhavas, according to Aiyappan, became a feauture of those rural areas where communist activists had been making revolutionary changes. Punitive actions were organised against caste Hindus for misbehaviour towards lower castes.[62] This is also the conclusion of Alexander in his article on emerging farmer-labour relations in Kuttanad.[63]

Lloyd and Susanne Rudolph quote from a study by Michael St John to the effect that the CPI "is the only autonomous party, for the others, as brokers for communal interests, are little more than the sum of their parts. The Communists do appeal to certain castes, but their appeal is germane to their programme, and their programme is within the framework of an overriding plan". The Rudolphs themselves mark the period 1957-59 as a watershed: "The very success of the CPI in gaining power under the banner of class ideology and in governing, for the most part, in the interests of the poor and dispossessed crystallised class tendencies within the various communities and helped free their members for mobilisation by party rather than by community appeal".[64]

One can put forward only suggestions to explain the changes the communist movement in Kerala has engendered in-

the ideological superstructure. If one accepts that the superstructure in its various constituents is largely a reflection of the basic structure, i e, the mode of production, then it follows that changes in the mode of production, in the relations of production and even in the mere conditions of production are bound to be followed by gradual alterations, sometimes only minute, in human consciousness and in political commitment.

Hardgrave in his study of the Nadars, has drawn an illustrative picture of caste consciousness which evolves from a parochial political culture *via* an integrated culture to a differentiated culture when the caste community becomes divided horizontally into class segments. Class, at least theoretically, becomes more behaviourally decisive under the impact of capitalism and its resulting polarisation: political support by the community becomes differentiated.[65]

The class antagonisms within the various castes have been revealed mainly by the activities of the communist organisations. In addition to the bulk of Ezhevas and Pullayas, poor Nair, Christian and Muslim labourers and middle classes crossed the line, mainly towards the CPI(M). This happened despite the so-called virulent anti-communist 'liberation struggle' of 1959 led by the Nair Service Society, the Churches and the Muslim League.

In but a few places in India outside Kerala, mainly the cities, has caste ideology broken down so radically. Although jatis do not usually function any longer as the basic unit in the relations of production, their ability to establish themselves in a class relation has not come about in most areas due to relative weakness of the progressive forces and the powerful economic and political position of the dominant castes.

As long as backward castes are economically and politically dependent upon the dominant castes, their horizon remains within the ideological world of caste, i e, their struggle remains limited to a struggle for Sanskritisation. This is what caste associations in Kerala had been doing from the beginning of the century without much success till a powerful communist organisation appeared on the scene.[66]

Djurfeldt and Lindberg have given a perceptive idea of the limitations of the earlier approach: "Since only hierarchy is questioned but not castes as such an element of the old ideology (caste) is coupled with an element of the bourgeois ideology (progress) in the utopia of caste emancipation, and this ideology dissolves the contradiction between continuing discrimination and misery of the rural proletariat and the idea of progress. Prevalent poverty is then seen as a result of incomplete caste emancipation, a type of teleology which is the peculiar hallmark of the 'development' ideology."[67]

The first Namboodiripad ministry has played a major role in removing to a great extent the illusions about climbing the social ladder through mutations in the caste system. For example, Pulayas did not convert any longer to Christianity, for they had noticed that it would mean nothing but substitution of social discrimination within the Churches for discrimination within the Hindu system. They became politicised and turned towards the Communist Party.[68] The violent struggle against the communist government in a sense speeded up this process.

Father Vadakkan, one of the main leaders in this struggle, hardly one year later had to follow his catholic mass basis in the shift towards the CPI (the Karshaka Tozhilali Party). The elections of 1960 itself showed that despite the blatant anti-communism of the Nair and Christian communal interests the communist party increased its popular vote from 40.7 to 43.3 per cent. Except for three constituencies, popular support increased everywhere, even in the traditional Christian belt of Kottayam where, with four more candidates fielded, the percentage of votes went up from 29 to 40 per cent. In some constituencies more than fifty per cent of the Catholic population voted communist.[69]

All this of course does not mean that communalism was eradicated in Kerala. Though it ceased to prevail, caste remains a factor to reckon with. According to Kathleen Gough, it might be more widespread "among the landlords, the industrialists, plantation managers and professional classes". Gough observed that there is a constant struggle going on within the ruling classes who try to build up and preserve political support among their caste adherents; the ruling parties are coalitions (often uneasy ones) of "ethnically oriented capitalist vested interests".[70]

At their inception, the caste organisations, particularly the NSS and the SNDP, played a progressive role, in the sense that they propagated ideals favourable to the spread of capitalism and of democratic structures. However, with the rise of socialism as an ideological and political factor, the caste leaders became inimical to the very ideas they stood for. The caste appeal — Ezhava bourgeoisie and agricultural labourers against Nair bourgeoisie and agricultural labourers — served as a reactionary shortcut in the class struggle. It equally served as a tool of creating a political basis from which ethnic associations could compete for power in the administration, which allocates enormous funds for educational, cultural, welfare and even economic purposes to these associations. These funds, in the absence of any real capitalist development, remain a secure way of amassing wealth.

In their competition for as high a stake as possible the Nair, Ezhava, Marathomite, Jacobite, Muslim and Kammala ruling strata on certain issues went along with the communist government (Nair vested interests supported the educational bill since they expected this would entail more funds for their schools and less for the ecclesiastical schools). The same caste leaders, however, started a frenzied appeal to the obscurantist forces of religion and caste from the moment their class interests were endangered.

The difficulty of the communist movement, not its mistake of course, is that it has to work and shoulder responsibilities in a limited area, subject to the Constitution, the central state power and the exigencies of the weaker communist movement in other parts of the country. In this particular constellation a revolutionary improvement in the living conditions of the people is hence excluded. This in its turn gave and gives the caste ideologists a political basis among the downtrodden masses.

The undivided communist party in Kerala realised this very well. Basing itself on class rather than on caste it to a considerable extent brought down the ideological system of the old society. But its political answer to the reactionary forces reflected a reformist tendency. The strategy was to win over the democratic and progressive elements in the Congress. The directives of the fifth Kerala state conference of the CPI in November 1959 indicated that the CPI should build up a united front against the Congress, Muslim Party and PSP in the elections, but not an anti-Congress united front: "Our enemy is not the Congress as such, but the reactionary forces inside and outside the Congress. Hence all these Congressmen who stand firm on the declared policies of the Congress and

are prepared to fight the Swatantra-PSP-Jan Sangh combine and their friends inside the Congress are our allies".[71]

This was, in a nutshell, the political line of the leadership of the right CPI who in Kerala had a majority in the state party committees.

Conclusion

The description we have attempted has been conducted mainly on the macro-level, on the issues of policies and performances of the first communist government in Kerala. Such a description is quite easy. It shows that the Communist Party as the party of the downtrodden masses had the political will and sincerity to implement the necessary reforms.

A more difficult exercise is to relate the compromises, the waverings, the omissions, the sometimes gradual and cautious approach of the leftists government to the strength of the opponents, to assess the actual limitations in the light of tactics and strategy. This marks the difference between the spectacular two steps forward and three steps back, and the more stubborn, practical-minded one step forward at a time.

Even more difficult a task is to assess the political work done at the base. For, the difference between a people's party and a bourgeois-landlord party is that whereas the latter restricts its activities to administration, patronage, gimmickry and electioneering, the former organises and mobilises the people at the basis. Did the patient work of the communists cadres in the villages, schools, offices, universities, factories, etc, develop political consciousness or not? This question, I am afraid is not answerable conclusively by me, nor by Ashok Rudra for that matter. Even then, it is the most important criterion on which a communist party can be judged. A number of indices and quite a few studies (Gough, Oomen, Alexander, Hardgrave, Rudolph, Raj, Turlach) seem to indicate that substantial work was done in this respect, though, as the CPI(M) after the split mentioned repeatedly, not enough.

Illegal Transactions in Trade and Payments in India

A Reply

IN a comment made by Vidya Pitre[1] on my article "Illegal Transactions in External Trade and Payments in India"[2] the validity of certain theoretical statements and empirical analysis has been questioned.

Pointing out omissions in the theoretical analysis Pitre has argued that Quantitative Restrictions being one of the major forms of import control, premium on imports which results therefrom should have been incorporated in the framework of the paper. Elaborating this, she writes, "since imports are remunerative in general, there will be a tendency towards numerous bogus claims to import licence entitlement under the existing system of allocation. As the claims are not genuine, these imports are likely to be over-invoiced thus creating demand for foreign exchange. Importers benefit by over-invoicing as long as the premium on the foreign exchange exceeds the premium on imported goods."[3]

Firstly, one does not know how premium on imports influences invoice manipulation of imports. The premium on imports is independently determined by domestic demand, domestic output and quantum of import quota for a particular commodity. The over-invoicing of imports does not enable the importer to acquire higher proceeds on sale of imported commodity because over-invoicing does not increase the physical quantity of goods imported. Therefore, whether or not the importer will benefit from over-invoicing is not determined by the premium on foreign exchange in relation to the premium on imports as is stated by Pitre, but by premium on foreign exchange in relation to rate of import duty. The tendency to over-invoice will prevail so long as the premium on foreign exchange exceeds the rate of imports duty. If the rate of import duty is higher than the premium on foreign exchange, the importers will tend not to over-invoice but to under-invoice imports. In this case the reduction in their tax burden will be greater than the premium they pay to acquire foreign exchange in the unofficial market in order to pay the exporters (sellers in foreign countries) to the tune of under-invoiced portion of imports. The premium on imports is an additional gain to the importers whose total value remains unchanged by invoice manipulations and is therefore not a consideration in the latter. The incorporation of premium on imported goods in Pitre's analysis is erroneous.

It might be stated here that the premium on imports is one of the considerations in the smuggling of goods. The in-smuggling of goods is profitable and creates demand in unofficial foreign exchange market so long as the premium on those imports is higher than the premium on foreign exchange.

Further, the premium on imports is also one of the gains considered in the over-invoicing of exports where exports qualify for import entitlement. By over-invoicing exports the exporters benefit on account of premium on foreign exchange to the tune of over-invoiced portion of exports, premium on import entitlement and direct export subsidy. On the contrary, in the case of export duty, the tendency to over-invoice exports would prevail only if premium on foreign exchange and on additional im-

TABLE. ESTIMATES OF TOTAL LEAKAGE OF AND TOTAL DEMAND FOR FOREIGN EXCHANGE THROUGH INVOICE MANIPULATIONS

port entitlement is greater than the additional export duty. However, if the latter is greater than the former the tendency would be to under-invoice exports and not over-invoice them.

Now let us pass on to the questions raised on the validity of empirical estimation of the degree of invoice manipulations. The estimation of under-invoicing/over-invoicing of exports and imports of India from 1962 to 1971 is made by using partner-country data comparison technique. The limitations of this technique were discussed in the paper and Pitre adds a few more to the list. Unfortunately, no alternative method of estimating the magnitude of invoice manipulations has been suggested. The cross-checking of the original estimates of invoice manipulations reveal two types of errors in estimation. The errors regarding the discrepancies between imports and exports figures for different countries from 1962 to 1971 could be classified into typographical errors and computational errors. The typographical errors in Tables 1 and 2 (in the original article) that show invoice manipulations with respect to India's different trading partners have not affected the estimates of total amount of over-invoicing/under-invoicing of imports and exports, while only computational errors in these Tables have altered *the latter estimates. It is* found that the majority of the computational errors pointed out by Pitre in Tables 1 and 2 in her comment are below $0.05 million and hence insignificant These computational discrepancies, therefore, do not change the estimates of total amount of over-invoicing and under-invoicing which have been made only in integer values and expressed in millions of dollars. Table here shows the original estimates, Pitre's estimates (as per *Table 3 in her comment*) and the cross-checked estimates. It would be observed that only five out of a total of 40 estimates marked by asterisk differ significantly. However, these divergences leave the broad conclusions of the study unaltered.

The estimates of smuggling have been made on the basis of the data on the amount of contraband seized by the customs authorities. The reasons for taking 10 as the multiplier have been explained in the paper. This multiplier could be more for gold than for other goods, as is suggested by Pitre. Nevertheless, there is no plausible way of finding different multipliers for different items of smuggled goods. The cross-checking of the original estimates of smuggling also does not reveal any *significant error in computation.* Pitre's corrected estimates are significantly *higher from the year 1967 through 1974* and not for 1961 to 1966. The divergence could have occurred due to differences in the choice of articles and in the derivation of pro-rata annual figures from the data of custom seizures.

Summing up, the allegations of omissions in theoretical analysis being ill-founded and the computational errors pointed out not affecting the overall *trend of the estimates of total over-*invoicing/under-invoicing, the theoretical and empirical validity of the main conclusions stated in the study remains unaltered.

[illegible] motives which impelled [illegible] whether it was notching [illegible] the Soviet Union in the [illegible]-Soviet struggle, whether [illegible]...ing the cause of the [illegible] Indo-Chinese states which [illegible] ...posed, or even whether it [illegible] discomfitted by, actual or threatened, disturbances along its border with Kampuchea — by playing the role it has in the overthrow of the government of the Kampuchean Communist Party in Phnom Penh, it has laid the basis for protracted conflict between the peoples of Viet Nam and Kampuchea. The dramatic re-emergence on the world political scene of that arch representative of Kampuchean nationalism, Norodom Sihanouk, is symbolic of this unhappy portent. The conflict is bound to spill over to the other nations of South-East Asia, Thailand most immediately. This prospect can only gladden those who have always relied on fostering division and hostility among countries to further their domination over them.

Assam

Border Clashes

THE incidents in the disputed territory between Assam and Nagaland on the morning of January 5, in which about 50 persons are reported to have been killed, have been promptly attributed to 'Naga hostiles'. This is really strange; for only a few days before, the Nagaland Chief Minister had been claiming that there were no more 'federal undergrounds' in Nagaland and that the only 'underground' elements were those that have set up bases in Naga areas on the Indo-Burma border, with whom negotiations are even now [illegible] to be taking place with a [illegible] to persuading them to accept the terms of the so-called 'Shillong [illegible]...ment'.

Whether the 'hostiles' are still active in Nagaland, or whether they are only [illegible] to a small area across the border, is beside the point. What is [illegible] is that this attack, which has been launched from deep within Nagaland in an area which is under dispute between Assam and Nagaland has had to be so 'naturally' attributed to 'hostile Nagas'. If indeed the federal forces have been able to strike so deep inside Assam-Nagaland territory, it speaks poorly of the vaunted ability of the Indian security forces to contain and defeat the insurgency.

Perhaps a better clue to the identity of the attackers, and their motivation could be had if one goes a little deep into the background of the dispute between Assam and Nagaland, and also into the circumstances of the break in the federal set-up and the emergence of a 'Revolutionary Government of Nagaland' in November 1968, the 'surrender' of this section of the 'underground' and the dissolution of the 'Revolutionary Government of Nagaland' in August 1973, and developments thereafter.

The boundary between Assam and Nagaland has been the scene of some of the bloodiest encounters between the armed police of the two states; it has been allowed to fester because the Centre has till now not taken any action upon the recommendations of a boundary Commission set up by itself, and which submitted its report more than five years ago; and in all such 'encounters' in the boundary areas earlier, it has been the armed personnel in the employment of the two governments who have been engaged and, at least on one occasion, in a bayonet combat. It is clearly in the interests of the Central government to keep border disputes between states festering.

Further, many of this 'Nagaland Armed Police' whose members have been engaged in these clashes comprise former 'underground' elements who broke with the Federals in November 1968 and, about five years later (during which period, whatever political power the Government of India chose to allow the Naga people to exercise effectively lay with the Semas) 'surrendered' and came 'overground' in August 1973, thus making it possible for newspapers to report the end of insurgency in Nagaland. A *quid pro quo* these surrenderers, largely though not entirely comprising the Semas, were promised was that they would be absorbed into the Nagaland Armed Police and a to-be-created 'Naga Regiment'. The 'Naga Regiment', part of the Indian Army, has since then been successfully deployed in many areas, though never in Nagaland itself; and the Nagaland Armed Police has before now, as noted above, been active in the disputed areas along the Assam-Nagaland boundary.

The present incident has taken place almost on the morrow of yet another agreement arrived at between the Chief Ministers of Assam and Nagaland to maintain peace and harmony along the boundary between the two states in the spirit of the interim agreement arrived at in 1972. The incident has also succeeded in at least unsettling what little prospects there had been for bringing the Federals into a working arrangement within the Indian Union. It has gravely undermined the position of the Nagaland Chief Minister who (unlike during the period when he was Chief Minister under Congress rule at the Centre) has been able to establish cordial relations with the Centre and, more importantly, with his counterparts in other states of the region.

If indeed the reports that the attack has been mainly the doing of Sema elements in the Nagaland Armed Police turn out to be correct, a wholly new dimension would be added to these developments. The decline of the NNO in Nagaland politics has been followed by a whole series of internal crisis in that party which culminated in the merger of the NNO into the Congress during Emergency and later, its identification with that faction of the Congress headed by Indira Gandhi. The Congress (I) of course has the greatest interest in the present situation in creating instability in wide areas of the country which, hopefully, would lead to the collapse of the Janata government at the Centre, or at least force it to hold fresh elections to Parliament. The links, if any, between the raiders into Assam's territory and disgruntled elements in Nagaland politics, and the larger links between these elements and the Congress (I) need to be investigated.

Rubber

Grower vs Industry

THE 'rubber conference' convened by the Union Minister for Commerce, Civil Supplies and Co-operation on Tuesday (January 9) was broadly concerned with deciding on norms for a fresh (and further) upward revision of floor prices for rubber and the vexed question of rubber imports. Given the fact that the interests of the various parties concerned are, by their nature, irreconcilable,

It is no wonder that no firm decisions could be arrived at during the 'conference'. Of course, the whole 'conference' was in the nature of a brains-picking session and the decisions by government are promised 'in the near future'; nevertheless, the stands taken by various participants representing industry, growers, states which grow rubber, etc, give some clue to the present situation in rubber.

The overwhelming question regarding rubber is: should there be or should there not be rubber imports. This has certainly been the case since the middle of last year when, after the brief spurt of prosperity following the export of over 10,000 tonnes of rubber in 1977-78, not merely were exports of rubber stopped altogether, but a sustained campaign by rubber consuming industries for import of natural rubber had to be yielded to, despite the strong counter-pressure applied by rubber growers. This pressure for rubber imports coincided with a steady rise in rubber prices till a situation arose when the market price bore little relation to the minimum price guaranteed by government for the product. What the growers have been demanding is an end to rubber imports, and an upward revision of floor price for rubber (which is presently Rs 655 per quintal, fixed in August 1977 on the basis of costings made in 1976); the manufacturers equally strongly demand increased imports as well as, absurd as it may seem, a buffer stock of four months supply — absurd because part of the reason for the artificially high prices of rubber is widely believed to be the cornering of stocks by rubber consuming industries themselves.

The Centre for its part already seems to have decided on increased imports of rubber. It was announced in the middle of last month that the Centre had decided to import a further 15,000 tonnes of natural rubber, in addition to the 15,000 tonnes already imported earlier in September, despite the fact that the first consignment of imports turned out to be of sub-standard quality which had to be rejected as "water-logged and rotten". Clearly, the pressures from the rubber industry which have been consistently applied since the middle of last year seem to have yielded results, and not surprisingly, tyre companies have been expressing 'subdued confidence' in the future fortunes of their undertakings — a confidence dictated as much by the various 'portents on the economic horizon' as by the prospect of increased liberalisation of rubber imports.

A curious feature of the controversy surrounding the proposal for import of rubber is that the proposal has received strong support from UPASI, the organisation of the plantation industry in southern India. While growers in Kerala were protesting in one voice against the import contract already entered into and the one that was in the stage of being entered into, UPASI was urging (in October 1978) that "sufficient raw rubber to meet the current shortage should be imported". The UPASI committee formally appealed "to all responsible producers not to oppose the import of rubber but to be flexible and appreciative of national needs. The short-term high prices are against the best interests of the growers". The exhortation is indeed curious, for whatever "high prices" rubber growers have been able to realise during a short period of one year has been after a very long period of price stagnation; the posting of the minimum price in September 1970 (at Rs 520 a quintal) did not have its impact till early 1974 when only prices began to rise. And even the last revision of the floor prices made in August 1977 was, as noted above, based on 1976 costs and, according to growers, hardly reflects the present cost structure.

But such concern about "high prices" can perhaps be explained if one bears in mind that rubber growers, as a rule, do not come under the category of owners of large plantations. About 94 per cent of the 136,000 rubber growers are in one state, Kerala, and the overwhelming majority of their holdings, 85 per cent, are of less than two hectares. Rubber growing can thus hardly be described as a plantation industry; in fact, according to a 1975 study, there were only 627 holdings in the whole country of more than 20 hectares.

What however transpired at Tuesday's 'rubber conference' is that the plans to have an integrated policy for rubber, which would satisfy both growers and the consuming industries seem well nigh impossible. The situation is not unique; it is exactly what it is in any other industry, with the producer of the raw material anxious to secure increases in prices, and the consumer industry anxious to hold them down. Fortunately for the rubber grower, his plight is unlike that of the jute grower who, in this constant struggle, has always lost out.

Tripura

'Easy' Solution

THE Tripura government seems to be facing an unusual predicament in that it is being opposed by an improbable coalition of the Ananda Marga (which is championing the cause of the Bengali settlers and which accuses the administration of appeasing the tribals) and the Tripura Upajati Juba Samity (TUJS), the organisation of tribal youths in the state, which accuses the government of being anti-tribal. The agitations are slated to begin with a Tripura Bandh called by the Ananda Margis on January 17 and carried forward from January 26 when the TUJS will start its campaign of preventing the government from functioning in the tribal areas.

The trouble the Tripura administration is having with the TUJS is particularly unfortunate. Of the four major demands of the TUJS (which were also part of the platform of the Left Front during the elections) three — recognition of Tripuri as a state language and a medium of instruction, restoration of illegally transferred tribal land to their original owners and introduction of tribal quota on proportional basis — have either been implemented or are about to be implemented, according to the state government; the fourth, the creation of an autonomous tribal district council under the Sixth Schedule of the Constitution, has been held up because the state government cannot do anything in this regard short of an amendment to the Constitution. And the Chief Minister has announced that consequent upon the Centre's reluctance to amend the Constitution to include Tripura as one of the states wherein the provisions as to the administration of tribal areas as provided in the Sixth Schedule of the Constitution would be applicable, the state government itself has decided to use whatever powers it has and create an autonomous tribal district council which would confer certain rights on the tribals. The proposed district council is to comprise 137 mouzas covering half the state's territory and will facilitate greater tribal control over development projects in these areas. There is also a provision to make it impossible for non-tribals to buy land within the jurisdiction of the proposed district council.

What is however disturbing is that the Tripura Chief Minister has sought to explain the present troubles his administration is facing as being due to the activities of 'foreign agencies' and has accused TUJS leaders of being in league with foreign missionaries, specifically Billy Graham's evangelical movement in the United States. Local tribal leaders are alleged to have been in contact with Graham. And with a view to

[illegible] such links developing further, the Tripura administration has proposals to bring before the state assembly a Bill forbidding "forcible religious conversions" — rather along the lines of the measure adopted already by the Arunachal administration.

It is no one's case that foreign agencies are not active in the northeast; and these foreign agencies are not confined only to those of the United States. But these activities have been possible only because the Government of India itself has encouraged them since it sees in the Church a bulwark against any kind of progressive social movement in the hill regions. Hinduism, with its atrophied hierarchical structure, has seldom attracted the tribal people; and given their economic and social organisation, tribal society should not find progressive ideas of social organisation difficult to appreciate. But precisely because of this, it is necessary to enslave the tribal people to a world view — Hindu or Christian, it does not matter — which would make it so much harder for them to break from it and embrace a more progressive social outlook. After all, it was not only the imperialists who carried the bible along with the sword. The government of India itself allowed a reactionary churchman like Billy Graham, whose links with the then US administration headed by Richard Nixon are a matter of common knowledge, to visit Nagaland in 1972, and he was later even received by Indira Gandhi.

It is unnecessary to labour the point about the Church and the communist movement in India. But what is strange is that the Tripura Chief Minister does not seem to recognise that these incursions of the Church are directly linked to certain failures on the part of the existing set-up; that if the tribal people find the foreign missionaries more responsive to their needs, it also speaks of a very serious kind of failure. To propose to combat the insiduous influence of religious bigotry by legislating against 'forcible religious conversions' is to accept defeat even without joining the battle. What is more surprising is that such a seemingly 'easy' solution to the problem, with no attempt at a more scientific appreciation of the situation, should have been proposed by a leader of the CPI(M) in Tripura.

Sugar

[illegible]

THE 1978-79 sugar season has completed its first quarter. By the end of March, it will be possible to make accurate production estimates for the whole season.

To look back, for the first time in its history, the sugar industry was completely freed of all controls on August 16, 1978. As a matter of fact, the 1977-78 season registered several other new developments. The sugarcane crop touched a new high of 182 million tonnes and sugar production was almost 6.6 mn tonnes, an unimaginable level till recently. The industry crushed 68 mn tonnes of sugarcane, i e, 37 per cent of the total cane crop. This also is a record For the last four decades, the industry's share of the cane crop had ranged from 30 to 33 per cent. Capacity utilisation in the sugar industry was 120 per cent, since the installed capacity of the industry is reckoned to be 5.5 mn tonnes. The concept of capacity in the sugar industry is a rather flexible one, however, since there have been seasons in the past when capacity utilisation has touched even 150 per cent.

Total decontrol has certainly benefited the relatively better-off sections of the urban population who used to buy sugar in the free market, since the price of sugar is now around Rs 2.40 per kg compared to the pre-decontrol free market price of Rs 4.20. However, those who earlier relied entirely or mostly on ration sugar, which used to be priced around Rs 2 30 per kilo, are not better off An unusual development has been that the best varieties of gur have been selling dearer than sugar.

Spokesmen of the industry have been bemoaning that the current season has opened with stocks which are at least double the opening stocks of the previous season and that the industry does not have the financial capacity to bear the burden of these stocks. However, the government has been far from unsympathetic to the industry. The tariff value of sugar has been slashed from Rs 300 to Rs 180 per quintal over a period of 15 months. Further, the rate of excise duty has also been cut from 45 per cent to a little less than 20 per cent. As a combined result of the two steps, the duty on a bag or quintal of sugar has come down from Rs 135 to Rs 32 52.

Sugar statistics are available for the first two-and-a-half months of the current season at the time of writing Production of sugar during this period was 7.86 lakh tonnes or 1.23 lakh tonnes more than that in the same months of previous season. The offtake has been 1 5 mn tonnes, almost 1.3 mn tonnes for internal consumption and the rest for export, compared to 0.9 mn tonnes in the previous season. Stocks on December 15, 1978 were 2 6 mn tonnes.

The low prices and the removal of control have thus definitely stimulated consumption Consumption was 3 lakh tonnes per month on average in 1976-77 and rose to 3 6 lakh tonnes in 1977-78, in the current season it is running at the rate of 4 lakh tonnes per month.

Time to Make Choices

SOMEWHAT belatedly I would like to record some comments on West Bengal's CPI(M) Finance Minister Ashok Mitra's letter and your footnote (November 11) concerning taxation.

There is not only a lib-lab way of criticising *EPW's* comment (October 14) but also a lib-lab way of meeting that criticism. This is the most likely explanation of the Editor's meek note, leaving his poor correspondent in the lurch. This stems from the faulty understanding of the role of taxation which bourgeois economists interpret as 'encroachment' on capitalist preserves and social-democratic theorists as having something to do with an advance towards socialism *via* a redistribution of incomes. Ashok Mitra considers it contradictory on the part of *EPW* to denounce taxation (in certain cases) and again to admonish the state government for not imposing more of it on the propertied class.. But where is the lack of consistency in demanding: do not tax the poor, rescind all indirect taxes and tax directly the rich more and more? If there is any contradiction in it, it is because there is contradiction in real life. Concerning taxation Lenin said, "Social-Democrats must ruthlessly combat bourgeois lie, spread also by many opportunists in Social-Democratic party, that it is 'impractical' to advocate revolutionary high rates of property and income taxation. On the contrary, this is the only practical and the only Social-Democratic policy. First, we must not adapt ourselves to what is 'acceptable' to the rich; we must appeal to the broad masses of the poor and propertyless who are indifferent to, or suspicious of, the Social-Democratic Party, largely owing to its reformist and opportunist character. Secondly, the only way of wresting concessions from the bourgeoisie is not by 'bargaining' with it, not by 'adapting' ourselves to its interests or prejudices, but by preparing the revolutionary forces of the masses against it. The larger the section of people we convince of the justice of revolutionary high taxation rates and of the need to fight to secure such rates, the sooner will the bourgeoisie make concessions. And we will utilise every concession, however small, in the unswerving struggle for the complete expropriation of the bourgeoisie" ("Tasks of Left Zimmerwaldists").

While recognising the fundamental laws of modern socialism as justified, Ashok Mitra perhaps will say: the realisation of this is possible only in the distant future, a future which for all practical purposes is quite out of sight. Thus, for the present, one has to have recourse to mere social patchwork. But patchwork does not solve the problem; agrarian reform, even of the most radical type, does not remove poverty — the whole history of agrarian reform will bear it out, that it helps to develop capitalism in the countryside and consequently class struggle. Lenin said, "If you refuse to believe the flowery talk about the 'interests of the people' and try to delve deeper, you will find that you are dealing with the out and out ideologists of the petty bourgeoisie, who dreams of improving, supporting and restoring their (people's in their jargon) economy by various innocent progressive measures, and who are totally incapable of understanding that under prevailing production relations the only effect such progressive measures can have is to proletarianise the masses still more " ("What the Friends of the People Are"). Articles and statistics that appear in the *EPW* prove the correctness of the observation. We do not altogether deny the possibility of partial concessions and do not say that we shall not take advantage of them. But in no circumstances should we forget the role of 'concessions' as an instrument of deception and corruption. There is only one way to make the reforms, however small, play a revolutionary democratic role — it must be effected on the revolutionary initiative of the masses by revolutionary means in an 'illegal' way so as to train the masses in 'disobedience', for the revolution is most illegal and authoritarian. That is a frightening prospect and the very word revolution is anathema to the CPI(M) leadership. Not class relations but Centre-state relations is its central preoccupation. The 'Marxist' state is the most peaceful state in India and Ashok Mitra in his list of firsts should have included this too. But when Ashok Mitra claims, as he did in his maiden speech as Finance Minister, that his budget will have taken away the sleep of the capitalist class in West Bengal, it is difficult to remain calm.

With an air of triumph he challenges the *EPW* to make its choices. Indeed it is time *EPW* did it. Either expose the economic theories that by means of timely state action in fields of fiscal and monetary policy and industrial planning society can be made to work well, expose the hollowness and hypocrisy of bourgeois economics or paraphrase them into 'socialist' economic theories.

Calcutta, December 14 — A Reader

Unofficial Ban?

CHITEGU CHINTE, a political satire made in Kannada by Director M S Sathyu was suddenly taken off the screen from all the cinema houses in Karnataka after it ran for a short time. The event and the circumstances surrounding it have left the film-goers disappointed and puzzled.

Although *Chitegu Chinte* did not fare too well at the box office, it was not the kind of film to collapse in just a couple of weeks. Some of us who went to see the film on Thursday (November 30) found an impressive attendance in the 'Nartaki' and 'Uma' cinema houses, and could not quite understand why suddenly an old Hindi film (on a second run and without prior advertisement, at 'Nartaki') should be on show the next day. This raises several doubts:

> Is it true that political pressure was brought upon the producers and the distributors of the film to cancel the shows throughout the state?
>
> Is it true that government offered to "compensate" the producers appropriately?
>
> Has the state government refused to accept the verdict of the Central Censor Board and consequently imposed an unofficial censorship on the film?
>
> Is politics the monopoly of the politician? Does not the artist have the freedom to criticise or parody the political situation?

Bangalore, December 4

The Familiar Patterns

Romesh Thapar

THE bank clerks are on the rampage, and with the officers not too far behind. The Life Insurance workers are preparing to follow suit. Travel by the Indian Airlines or the railways, and all the schedules are in shreds. Delhi transport, never known for simple efficiencies, jams up the traffic on the roads because some union leaders sedulously spread false rumours of police victimisation. A Calcutta businessman (a friend of Sanjay!), up for trial in Lucknow, takes his supporters with him, expels the judge and "captures" the court. All this is apart from our daily dose of officially-condoned dacoity, racketeering and what have you.

The patterns are terribly familiar. The individually powerful, and those who are well-organised in the strategic areas of economic life, are using the opportunities of freedom as if these were exclusively available to them for their very own betterment, advancement and consolidation. They seem to imagine that the country is for them, and policies only make sense so long as the elite — and that includes its labour aristocracy carefully organised in a monopolistic public sector! — can batten on them. We have been living with this downable "culture" for many years, and no one has really challenged its crystallisation.

Indeed, when the system by which we govern ourselves was tottering to an unsteady standstill, Indira Gandhi decided that she would attempt a propping up operation by the declaration of the Emergency. It saved her temporarily, protected her son, and imposed disciplines of some sort through fear, jailings and atrocities. The healthy revulsion of the people in the 1977 general elections held out the promise that the disruptors of democratic life would be isolated and that new forms of participative functioning would evolve. The Janata party's failure to restructure this new democratic way, and the contentment of its aged power-seekers with the wretched *status quo ante*, which surrounds us and suffocates us, has again brought to the surface the authoritarians of the Emergency.

Indira Gandhi and her determined group of well-financed operators (under the command of son Sanjay!) are active in exploiting every major and minor breakdown, and particularly the violence in the streets, not to suggest remedial solutions but to recall by contrast the glories of the peaceful and ordered days of the Emergency. Non-governance is contrasted with personalised, tough leadership as if these are the only two alternatives before the people of India. There is not a mention of the principles of organised, principled and thoughtful government — for which, incidentally, the people voted memorably in 1977.

The tragic dimension of this deteriorating situation is the politicians' drift into these equations of thinking. You have only to listen to a discussion of the current scene between Congress folllowers (Indiraists, Swaran Singhites and so-called Third Forcers!) to realise that they are obsessed with surface signs and reluctant to enter the crisis-torn system by which we organise our lives. The Congress dialogue influences the somewhat subdued debate in the Janata party and in other political formations, including, alas, those which call themselves communist. Populism has so taken hold of us that all issues are sought to be buried.

Add to this, the problems of the Scheduled Castes, the middle castes and the Muslims and we have the full flavour of the Indian political cocktail. These powerful groups hope to use the prevailing vacuum to push demands which might otherwise be denied priority. Politically, the pressure for decentralising the polity, even working for smaller and more manageable states, finds sustenance in the strivings of these sizeable segments of the population. If the embryonic kisan sabhas are able to lead this discontent and to link it more throughly with federal problems, we may yet see more healthy political action.

Apart from Charan Singh's disgruntled elements, who were able recently to mount a well-organised kisan rally in the Capital (a rally whose discipline and organisation put to shame the activity of supposedly sophisticated urban agitators!), there is a general failure of mobilisation on this front. Maybe, we will have to wait for the Hindi-speaking "heartlands" to experience the changes that the South has already witnessed in caste equations and balance before we can expect any forward movement on the solid social and economic issues which are awaiting the country's attention.

The crazy merry-go-round in the Janata party to find bridges between the three old men who are holding it to ransom needs to be replaced by a sustained exercise to find an alternative leadership — drawn from all the constituents in the most representative manner — and with a captain acceptable to all. This search has not been pursued with vigour, partly because the three old men show no inclination to hand over power to those who are more relevant in today's situation.

How long will we have to wait for the Janata party to move to maturity? And will the situation hold while this maturity builds? Or must the familiar patterns repeat and repeat — until we drown again? Loaded questions, but there is no easy way out of them.

SICKNESS IN INDUSTRY — I

A Case Study of Deliberate Management Policy

Jayati Ghosh

THE phenomenon of industrial sickness is as frequently discussed as it is rarely studied. This note attempts to study the causes leading to the sickness (in this case, continued losses and financial non-viability, leading to ultimate closure) of a single unit controlled by a large business house. The attempt has been to locate the main factors responsible, in an effort to find out whether "sickness" was in this case the result of the conjunction of several unfortunate circumstances, or the result of a certain pattern of corporate behaviour. While this does *not* provide the basis for any broad generalisations about the causes of industrial sickness, it provides an insight into management behaviour and methods of business of one unit of a large business house, from which some general conclusions could be drawn.

The Company in question manufacturing potteries and other ceramic items in eastern India was started in 1905. It was incorporated as a limited company in 1919, and was acquired by a professional ceramist in 1934 and substantially expanded and diversified. As the need for funds for expansion grew, the large house acquired majority interest, with the ceramist keeping a minority interest.

By this time, the Company was the major producer of porcelain in the country, and was the first to start production of fine China and decorative crockeries. In the late 1950s a second factory was set up to produce high tension and low tension porcelain insulators, the major purchasers of which were the Ministry of Defence, Government of India, public sector electricity Boards and various other State undertakings. The fine China produced by the Company had a commanding position in the domestic market and did not face major sales problems in the sixties. In the case of insulators there was competition but this was not severe, and from 1967 a beginning was made in the export of insulators.

From the late 1960s, the Company started facing problems of rising costs and discontinuous production along with various other problems, and started making losses. The situation gradually worsened, with frequent closures, nonpayment of DA and bonus, arrears of wages, and nonpayment of taxes and electricity bills. The financial results showed losses continuously from 1968-69 onwards barring a single year. In spite of a massive reconstruction operation undertaken by the IRCI, and various loans from other public financial institutions, the financial position steadily deteriorated until 1975 when both factories were closed, throwing about 5,000 workers into the ranks of the unemployed. In September 1976, the management of the Company was taken over by the Government of India under the Industries (Development and Regulation) Act.

Analysis of the balance sheet data reveals that the Company first started making losses in the financial year 1968-69, after which the operating results were unsatisfactory throughout. To understand the causes which led to this pattern it is proposed to undertake a fairly detailed financial analysis of the Company's working from 1963-64 onwards.

To consider first the causes advanced by the management as leading to the breakdown: the major factor stressed was labour unrest, due to inter-union rivalry. The labour agitation which culminated in closure of the factories for about four months from July 1969, and the subsequent go-slows, work stoppages, etc, were alleged to be the primary factor behind the poor performance of the Company from 1969. Furthermore, the workers' demands entailed a steep rise in costs because wage costs went up from 33 per cent of the gross value of production in 1968 to 51 per cent in 1970.

Table 1 shows the total wage and salaries costs (including bonus) in the period 1964-72, as a proportion of total costs. (All Tables are based on data from Company balance sheets.) From the Table it is apparent that while wage costs did go up, they did not show any qualitative increase after 1969. In fact, in absolute terms wage costs decreased from 1968 to 1970. The jump in wage costs as a proportion of gross revenue mentioned earlier was largely due to the sharp fall in sales that year, rather than to an increase in wage costs.

It is undeniable that labour unrest and frequent work stoppages disrupt production. However, in this case it is worthwhile to look into the factors influencing labour unrest. The Company employed about 5,000 workers. Compared to any other industry in the eastern region the wages were poor. (Cf statement of the then Additional Labour Commissioner, West Bengal.) Furthermore, over quite a long period the workers' PF and ESI contribution money was spent by the management without prior knowledge of the workers. In some years the Life Insurance Premium and CDS deductions from the wage were also spent. Working conditions were poor. Because inadequate attention was paid to maintenance and replacement of machinery, the task of running the machines became more difficult and taxing. It would therefore appear that the workers' agitation was more a *result* of the various problems besetting the company than the major cause of it. Obviously however it is true that strikes and other disruptions of production did aggravate the problem.

The management has further alleged that the erratic availability of power and city gas also contributed to the difficulties of the Company. Examination of claims of the Oriental Gas Company (suppliers to the Company) reveal however that the Company had neglected to pay bills for gas since much before 1969. In 1971 five cheques (amounting to Rs 163,498) issued by the Company were dishonoured. Around the middle of 1971 the Company obtained an interim injunction order from the Calcutta High Court restraining the Oriental Gas Company from disconnecting the gas lines to the factory in spite of non-

TABLE 1: WAGES AND SALARIES COSTS

Year	Wages, Salaries and Bonus (Rs)	Total Wage Costs as a Proportion of Total Expenditure (Per cent)

1968-69	None	Loss	—

TABLE 4: FIXED CAPITAL POSITION

Year	*Net Value of Fixed Capital (Rs)*	*Change over Year (Rs)*
1965 (June)	1,15,73,906	—
1966	1,10,08,128	−5,65,778
1967	1,12,49,513	+2,41,385
1968	1,09,99,709	−2,49,804
1969	1,04,34,291	−5,65,418
1970	97,28,364	−7,05,927
1971	1,06,96,813	+9,68,449
1972	1,01,56,457	−5,40,356

payment of dues. However, since then the gas supply to the Company was extremely erratic since efforts were made by the suppliers to cut down the supply of gas to the Company. The dues upto the time of lock-out in 1975 amounted to Rs 30,98,230.

A further factor mentioned by the management was the increase in raw material costs, especially resulting from the devaluation of the rupee in 1966. This was largely because essential raw materials required for efficient production had to be imported at much higher cost. This particular argument is validated by the data, as Table 2 illustrates. It has been alleged by trade union leaders of the workers of the Company that defective raw materials were purchased at unreasonably high prices as part of the corrupt practices of the management, but this is difficult to verify.

The above factors in themselves are, however, clearly not enough to explain the extremely poor performance of the Company, because similar conditions were being faced by several other units which did not show such poor results. One example that springs to mind is that of a rival company in northern India which emerged as a major competitor of the Company in the field of crockery, and has since displayed a significant growth of production and sales. It is evident that the former would also have faced problems of increase in raw material prices, but this did not have a major disruptive effect on its operations. So the main reasons for the Company's sickness must be sought elsewhere.

A careful study of the balance sheets indicates that the Company's problems had their roots much earlier than 1969, and were in fact the result of various management policies which could have had no other logical outcome. From the mid-sixties, the controlling group displayed a remarkable ignorance of the most obvious and basic rules for corporate survival as far as this unit was concerned.

The first indicator of such a pattern is given by the dividend policies of the Board of Directors of the Company. That an extremely high rate of dividend was paid out annually prior to 1969 is obvious from Table 3. The possibility of paying out dividends greater than the net profit came into being with the new system of appropriation begun in 1965, of entering, net profit into the General Reserve and paying dividends out of the General Reserve. This made it possible to achieve the incredible ratio of 242.09 per cent of dividends to net profit in 1967-68. Even prior to this, the dividends paid out had been an extremely high proportion of net profit, leaving a very small proportion for appropriation to Depreciation Reserve and General Reserve. The implications of such a policy in terms of building up reserves for further investment and expansion of production or overhauling of machinery and techniques are obvious. The main gainers from such a dividend policy were the primary shareholders, the large house with the majority interest.

In fact there was very little replacement of obsolete machinery or purchase of new machines from the mid sixties. Table 4 shows the changes in the net value of fixed capital (i e, additions minus depreciation). The net value of the fixed capital owned by the Company actually *declined* between 1965 and 1972. Furthermore, the machinery was kept in poor condition and in a state of ill-repair. The system of an annual overhauling and maintenance of machines during a special 15 days Dussehra-Diwali vacation was stopped, resulting in serious breakdowns and disruption of production.

The most glaring example of managerial apathy to the welfare of the Company was the commission to the sole selling agents, which was a subsidiary company wholly owned by the main shareholders, the large house and the ceramist's family, jointly. This firm of selling agents was paid an abnormally high commission on sales, even though it played no role at all in the sale of insulators which was organised directly with the buyers, generally government undertakings. Even as far as the crockery section was concerned, the parent company paid for the publicity, exhibition and freight and delivery expenses separately, so that it is difficult to see what function the selling agents played. Table 5 shows the percentage commission given to the selling agents as a proportion of sales, as well as the other selling and distribution costs borne by the Company.

In 1967-68, a commission as high as 11.14 per cent of sales was given to the sole selling agents; and the percentage had been increasing over the past two years; this in spite of the fact that the brunt of the expense of selling and distribution was borne by

JAWAHARLAL NEHRU UNIVERSITY

New Delhi - 110 067

Advertisement No. Aca. III/14/78

Applications are invited for the following posts:

School of International Studies: Centre for South, South-East and Central Asian Studies:

1. **Documentation Officer in South-East Asian Studies:**

   QUALIFICATIONS Essential: (a) A first or second class Master's Degree in one of the Social Sciences from an Indian or foreign University (b) Five years experience of research and documentation. Desirable: (a) Knowledge of Indonesian, Malay or Vietnames Language. (b) Field work in South-East Asia for academic purposes.

School of Languages: Centre of German Studies.

2. **Assistant Professors**

   QUALIFICATIONS Essential: (a) consistently good academic record with at least a high second class Master's degree in German or an equivalent qualification from an Indian/foreign University. (b) A doctor's degree or published work of an equally high standard.

Provided that if the Selection Committee is of the view that the research work of a candidate as evident either from his thesis or from his published work is of very high standard, it may relax any of qualifications prescribed in (a) above.

Provided further that if a candidate possessing a Doctor's Degree or equivalent research work is not available or is not considered suitable, a person possessing a consistently good academic record (weightage being given to M. Phil or equivalent degree or research work of quality) may be appointed provided he has done research work for at least two years or has practical experience in a research laboratory/organisation on the condition that he will have to obtain a Doctor's degree or give evidence of research work of equivalent high standard within five years of his appointments failing which he will not be able to earn future increments until he fulfils these requirements.

Desirable: (a) A very high degree of fluency in written and spoken German. (b) Some experience of teaching German as a foreign language to specified groups. (c) High degree of proficiency and specialisation in either German literature or translation-cum-linguistics. (d) Post M. A. Certificate in teaching German as a foreign language from CIEFL, Hyderabad. (e) Experience in materials production.

School of Social Sciences: Centre for Economic Studies & Planning.

3. **Associate Professor/Fellow in Economics.**

   QUALIFICATIONS Essential: (a) Consistently good academic record with at least high second class Master's Degree in Economics or its equivalent qualification from an Indian/Foreign University. (b) A Doctor's degree or published work of an equally high standard. (c) About five years experience of teaching and/or research.

   Specialisation: Micro-Economic Theory/Money and Banking with special reference to India.

Centre for the Study of Social Systems:

4. **Associate Professor/Fellow in Sociology (Research Methodology)**

   QUALIFICATIONS Essential: (a) Consistently good academic record with at least a high second class Master's degree in Sociology or an equivalent qualification from an Indian/Foreign University; (b) A doctor's degree or published work of an equally high standard. (c) About five years experience of teaching and/or research.

   Desirable:—(a) Training in quantitative methods and mathematics; (b) Experience of teaching courses in sociological methods from the perspective of theoretical sociology.

SCALES OF PAY

Associate Professor/Fellow	Rs. 1200-50-1300-60-1900
Assistant Professor	Rs. 700-40-1100-50-1600
Documentation Officer	Rs. 700-40-1100-50-1300

plus usual allowances as admissible to the members of the staff in the Central University.

Relaxation in any of the qualifications may be made (a) in favour of persons of eminence or of high academic professional distinction, and (b) in exceptional cases where adequately qualified persons are not available but are otherwise found suitable for the respective positions. It will also be open to the University to consider the names of suitable candidates who may not have applied. The selected candidates will be expected to participate in the teaching and research programmes in the concerned disciplines in other Schools of the University as well as in the programmes offered in their own Centres of Studies. Normally appointment of Fellows is made on contract basis for a period ranging from one to three years. Benefits of C. P. Fund-cum-Gratuity/G. P. Fund-cum-Pension-cum-Gratuity are available as per University rules. Persons already in employment should route their applications through proper channel. Due consideration will be given to candidates belonging to SC/ST at the level of Assistant Professor. Second class (mail) rail fare (both ways) will be paid to candidates invited to appear for interview from outstation by the shortest route subject to the production of rail receipt.

Applications, separate for each post, on the prescribed form, obtainable free of cost from the University by sending a self-addressed and stamped envelope of 23cm x 10 cm. size to the DEPUTY REGISTRAR (ACADEMIC) JAWAHARLAL NEHRU UNIVERSITY, NEW MEHRAULI ROAD, NEW DELHI-110 067, should reach him latest by 27th January, 1979.

Candidates from abroad, applying for faculty positions, may apply on plain paper, (but their applications should reach the University by the last date) furnishing all the relevant informations such as their names; date and place of birth, marital status; nationality; state of domicile; postal and permanent addresses; father's name and address; academic and professional attainments; full details of (a) publications, and (b) research projects undertaken; language(s) known; details of visits to foreign countries; and the name and addresses of at least two persons well acquainted with the candidates professional work who should also be requested by the candidate to forward to the DEPUTY REGISTRAR (ACADEMIC), confidential report concerning the candidate.

Grand Total Rs 12,56.86 lakhs

the Company itself Besides this, there were more indirect methods of transferring funds from the Company to the selling agents. Often, products (amounting to a large proportion of the sales every year) were declared defective or sub-standard by the Company and therefore sold at much reduced prices to the selling agents, who made no commensurate reduction in the market price, (*Cf* evidence of the firm of auditors to Company, appointed by the Company, before the Committee of Investigation appointed under the IDR Act to look into the affairs of the Company.) The sole selling agents thus served as a very effective *via* media for transferring funds out of the Company.

Besides these major lapses, there were other instances of Company funds being wasted or illegally appropriated through various means. It was alleged by the trade union leaders of workers of the Company that there was corruption in the purchase of raw materials, non-arrival at the factory of various essential spare parts and of coal, whose purchase had been listed in the stock books, increase in expenditure made in shifting materials from the railway station to the factory because of the directors' interest in the transport agency concerned; overstaffing and maintaining domestic servants at the officers' homes at the expense of the Company; and so on. Although the evidence for these instances is largely circumstantial and must be treated with caution, it would appear that such instances of corruption also played a part, however minor, in aggravating the ills of the Company.

One interesting aspect of industrial sickness in India is that it is generally far more expensive for the government financial institutions than it is for the shareholders of the unit concerned. Vast sums are spent by the various public financial institutions to support financially non-viable units and somehow maintain employment in such enterprises. This Company is no exception to this rule. Since the major crisis beginning with 1969 and ending with the lock-out and closure of 1975, the IRCI alone had pumped about Rs 113.56 lakhs into the Company, with no significant improvement in the functioning and operations of the Company. The total loans secured by the Company since 1964-65 from the PNB, IFCI, ICICI and IRCI amount to Rs 12,56.86 lakhs, a large part of which has not been repaid. Table 6 shows the loans granted to the Company by the various financial institutions since 1965. Also, the Company had defaulted in payment of statutory dues from 1969 onwards. At the time of closure, the statutory dues amounted to about Rs 2.5 crores.

Table 6 shows that heavy loans were taken throughout the period 1964-68, to the tune of nearly Rs 4 crores, in spite of the fact that, as we saw earlier, over this period the value of fixed capital actually declined and inadequate provision was made for depreciation. This was also the period in which the dividends paid out were never below 89 per cent of net profits and on one occasion even amounted to 242 per cent of net profits. It is difficult to see why the management would behave this way if it were at all concerned with the long term interests of the Company.

It is apparent from Table 6 that the various financial institutions had spent a large amount (in terms of granting loans) on the Company and had nevertheless not made any impact on the functioning of the Company. This makes it clear that problems of rising costs, labour trouble, etc, were not the major causes of sickness but rather the logic of management policy led to such a conclusion.

Bad management is often advanced as a major reason for industrial sickness. While this sort of explanation is so general, superficial and inadequate as to be extremely misleading, on one level it can be argued that, in the case of this Company the management was instrumental in aggravating the ills of the Company. Certainly, if one follows the cannons of sound business management, it is wrong to shift funds out of a company, to fail to re-invest or replace old machinery, not pay employees' benefits taxes or bills, and to generally encourage (even if only by default) every sign of decline in the company. But to attribute all this to managerial inefficiency is to show a certain amount of naivete regarding the politico-economic phenomenon of industrial sickness. The decline and ultimate collapse of an industrial enterprise controlled by one of the oldest and largest business houses in the country, whose other concerns are showing booming growth, can only be part of conscious policy. The thesis being argued here is that an industrial unit of large business house need not (and most probably will not) face problems of long-term illiquidity and financial non-viability unless the oligopolists concerned are sufficiently disinterested in the unit, or else find it profitable in the long run or in the interests of their industrial empire as a whole, to allow it to do so. One can locate several other instances, where a large house has one or two "model" units which show significant growth in sales and profits, and others in which

The profits are made, euphemistically speaking, through management. This thesis is too complex to be argued here on the basis of only one instance and without considering other more general problems, and therefore must only be suggested as a possible explanation for the peculiar vagaries of policy of the management of the Company examined. To understand this in its larger context, it is necessary to probe much deeper into the nature of oligopolistic behaviour in India and to review similar cases of sickness of individual units owned and/or controlled by large business houses. But the thesis presented here is that in certain circumstances one or two units are chosen by the large house for purposes of "milking" where the overall financial stake of the large house concerned is not very high, and where growth would depend on innovative changes which may eat into current profitability. To an extent, therefore, this also points to the neglect of long term interest for short term gains with reference to a single unit, which has not been an uncharacteristic phenomenon in the history of Indian industrial growth.

[The author is grateful to Prabhat Patnaik and Arun Ghosh for helpful comments.]

SICKNESS IN INDUSTRY — II

Role of Government Policies

(By a Special Correspondent)

IN discussions of spreading 'sickness' in industry, not enough attention is paid to the contribution of the government's own industrial policies, especially the many liberalisations and relaxations effected in licensing policies since the beginning of the seventies. In a number of industries, capacities very much in excess of demand have been created in the name of removing administrative delays, of inducing investment, of encouraging higher production, of enabling fuller utilisation of capacity, of promoting exports, of bringing about the development of backward states and areas, and so on and so forth.

This trend has been further encouraged by the emergence of the so-called 'joint sector' in industry. The licensing authorities at the Centre have very liberally issued letters of intent and licences for all manner of industries to the state industrial development corporations (SIDCs) of the various states — often for no better reason than that one or more states have already been issued licences or letters of intent for the industry in question. The SIDCs have then set about locating private sector collaborators for implementing the projects. For the private sector collaborators the attraction of this arrangement has been the ready availability of letters of intent or industrial licences as well as the numerous advantages which flow from the involvement of the SIDCs in the projects, especially the quick receipt of official sanctions and permissions and the greater readiness of the financial institutions to finance the projects (quite apart from the SIDCs' own 26 per cent contribution to the equity of joint sector companies).

This note briefly examines a not untypical instance of both the above tendencies — over-licensing of capacity and the encouragement of this process by the joint sector form of corporate enterprise — from the borax industry. Till the beginning of 1976 there was only one producer of borax in the country. This company has a licensed and installed capacity of 17,000 tonnes of borax per annum. However, because of insufficient demand, production had always been substantially below capacity. Nevertheless, a letter of intent for manufacture of borax was issued to the Tamilnadu Industrial Development Corporation (TIDCO) in October 1971. TIDCO set about implementing the project in collaboration with private sector parties and in June 1972 a company was formed which we shall here refer to as Company X. TIDCO's letter of intent was transferred to Company X and was in July 1974 converted into an industrial licence for a capacity of 15,000 tonnes of borax per annum.

Company X made a public issue of shares in mid-1975 to finance its project. The project was then estimated to cost Rs 94 lakhs, which was to be financed through equity capital of Rs 40 lakhs and term loans of Rs 54 lakhs. TIDCO's contribution to equity was Rs 10.40 lakhs. In addition, it was also to provide term loans of Rs 30 lakhs. TIDCO thus put up nearly 43 per cent of the project cost of Rs 94 lakhs as originally estimated, compared to the less than 11 per cent proposed to be contributed by the private sector collaborators. This was only the beginning, however.

By the time Company X went into commercial production at the beginning of 1976, the cost of the project had escalated to Rs 148 lakhs. The entire increase in cost was borne by the financial institutions. The company's annual report for 1976-77 indicates that as at the end of June 1977 its total borrowings stood at Rs 180 lakhs, of which Rs 56 lakhs was unsecured. TIDCO's share of loans had mounted to Rs 69 lakhs from the original Rs 30 lakhs and scheduled commercial banks had provided the remaining Rs 111 lakhs. TIDCO's total contribution thus rose to over 53 per cent, whereas the contribution of the private sector collaborators — who control the management of the company and hold the positions of managing director and executive director — to the increased cost of the project had shrunk to less than 7 per cent.

These are interesting facts and are not unrepresentative of the methods of project promotion and financing in the private sector generally and in the so-called joint sector in particular. But even more significant is the subsequent performance of Company X, which has been the direct consequence of the licensing and setting up of production capacity for which demand quite simply does not exist in the country. Against its installed capacity of 15,000 tonnes, it produced 2,658 tonnes of borax in 1975-76, its first year of commercial production, and 3,097 tonnes in 1976-77, giving capacity utilisation rates of 18 per cent and 21 per cent, respectively. However, taking account of unsold stocks at the end of June 1977, as indicated in the company's annual report for 1976-77, it would appear that it was able to find a market for only about 70 per cent of its minuscule output of borax in the first two years. Naturally, this situation has been reflected in the financial performance of the company which had, at the end of June 1977, accumulated losses of Rs 67 lakhs before making provision for depreciation, compared to its paid-up capital of Rs 37 lakhs.

The entry of Company X has also had its inevitable impact on the existing producer of borax, whose sales of borax dropped from 11,927 tonnes in 1975 to 8,552 tonnes in 1977-78. Taking the two units together, utilisation of their total capacity in 1976-77 may be roughly estimated (since the accounting years of the two companies are different) at no more than around 41 per cent. This has been the achievement, in this case, of the government's licensing policies.

An interesting sidelight of this case study is how companies make facile and unrealistic assessments of their prospects while making public issues of their shares. Company X's prospectus, in connection with its public issue of shares in 1975, had claimed: "Looking at the growth rates of the consuming industries it is anticipated that the demand for borax will far outstrip the supply. The total indigenous supply even after the plant commences production will hardly be in a position to meet the demand." It was further claimed: "The prevailing market prices have increased manifold in the last two years and on a very conservative estimate the project is expected to earn good profits and ensure a fair return on the capital employed from the second year of production."

Equally interesting is the standard of reliability, as seen in retrospect, of the feasibility report prepared for Company X by a professional consultancy firm. Since feasibility reports have become an article of faith with term-financing institutions and a whole host of others involved in the promotion of industrial projects, it is instructive to note that in this case the feasibility report prepared in the latter half of 1972 estimated, in all seriousness, that in 1974-75 the demand for borax in the country would be 51,700 tonnes. The combined sales of the two companies even in 1976-77 were not one-third that figure. What is more, Company X, TIDCO, the term-financing institutions and the commercial banks, for whose supposed scrutiny the feasibility report had been prepared, no doubt at considerable expense, had all accepted the report without question,

People's Science Movements

A Vaidyanathan

N Krishnaji

K P Kannan

THERE has been a growing realisation among scientists and social workers that science and scientific research in India, as presently taught and practised, has acquired an elitist character with little or no relevance to or concern for the needs of the people. This has led to the emergence of a number of voluntary organisations ranging from those explicitly oriented towards the 'popularisation of science' to those which seek to inculcate among the masses a scientific approach to understanding society and social change as a necessary pre-condition for progressive social transformation. These groups, spread all over India, vary in size and scope ranging from small groups working on particular problems in a limited area to a mass movement like the Kerala Sastra Sahitya Parishad (KSSP). A significant feature of these new activities is that they have begun to attract highly trained scientists and technologists who have become disenchanted with the relevance of what they have learnt and what they are doing in the 'scientific establishments' to the needs of the people. So far, these initiatives by different groups have remained highly localised with very little communication between them. In order to establish contact among such groups and provide an opportunity for them to learn from each other's experiences, the KSSP organised an All-India Convention of People's Science Movements in Trivandrum. The three-day convention (November 10-12, 1978) was attended by over a hundred workers from all over the country.

Those who participated in the Convention include the following groups: Science Education Group, Sastra Sahitya Parishad, Shramik Sanghatana, Bhoomi Sena, Indian Institute of Education, Bhim Sakti Tarun Mandal (Maharashtra), Grain Vikas Mandal, Science Circle, ASTRA, ASHA (Karnataka), Association for the Promotion of Science Education (Tamil Nadu), Vidushak Karkhana, Kishore Bharati (Madhya Pradesh), Vikshan, Scientific Workers' Forum, Bangiya Vigyan Parishad, Science and Technology Committee, Health Education and Policy Group (West Bengal), CSIR, Society of Young Scientists (Delhi) and Programme for Community Organisation and CSIR Regional Complex (Kerala).

The discussion at the Convention was focused on the following general themes: (1) formal and non-formal education; (2) people's health movements; (3) scientific research and technology; and (4) 'science for social revolution'. The discussions were based on theme papers on each topic as well as detailed presentations of the activities of each of the participating groups. Besides formal plenary sessions, there were numerous opportunities for informal exchange of views among the participants. The proceedings of the Convention will be published shortly; this brief review is meant only to bring out some of the main highlights of the conclusions emerging from the Convention.

The discussion on formal education noted that the weaker segments of the population get little benefit out of the system: few of their children get into it and a distressingly large proportion of them drop out easily; the system itself is far too elitist and fails to impart skills relevant and useful for the livelihood of the vast majority of the people, not to speak of inculcating the habit of identifying problems. These deficiencies call for a drastic reorientation and seeking solutions to the present system, which is the essence of the scientific attitude. The Convention felt that such reorientation should, among other things, have a built-in vocational bias, make vocational pursuits compulsory for all students at the secondary stage, tailor the vocational orientation to the needs of the people and build on the existing indigenous skills and knowledge. Following this approach, some of the groups represented at the Convention had initiated innovations in curriculum, pedagogy and teaching materials, especially in the teaching of natural sciences. But such efforts even when successful have to overcome powerful vested interests before they can be spread widely. In any case, the basic purpose of people's movements is to cater to the masses who remain outside the formal system and hence their focus will have to be much more on non-formal education.

Non-formal education has a dual role: first, it has to take care of the large majority of the people who are not reached by the formal education system; and second, it has to act as a supplement to the existing formal education system. It is recognised that the conventional notions of education will not be relevant in the realm of non-formal education. There is no teacher and the taught; the people who come to learn are not ignorant and there is no given evaluation method. Non-formal education must create an awareness in each man of his social conditions. It should consistently strive to demolish all myths of 'modern society', myths which are perpetuated by the formal education system and the mass media. In short, it must lead to a new outlook on life and the world and an attitude of self-confidence and assertiveness. The non-formal education approach could embrace different sections of the population: adult illiterates, women, workers, and the public at large. A variety of pedagogic methods, depending upon the local situation and having sufficient flexibility in content, should be built into the programme of non-formal education. Bureaucratisation in a non-formal education programme is apt to make it not only ineffective but also counter-productive. The present attempts at non-formal education vary from the use of audio-visual methods to focus the attention of acute social problems like housing among the poor (as employed, for example, by Science Education Group in Bombay) to the method of study classes, quiz competitions, classes for skilled and semi-skilled workers and adult literacy centres (as employed, for example, by Kerala Sastra Sahitya Parishad). The role of voluntary organisations in the non-formal education programme was recognised to be a crucial one.

A lot of time, both in formal and informal sessions, was devoted to the need for a people's health movement. The present health delivery system in India caters to the needs of the richer sections of the population. That the majority of the people do not receive adequate health care from the existing system and that the system has built up a very high cost structure leading to the emergence of powerful and interconnected pressure groups of medical practitioners and the pharmaceutical industry was emphasised. In initiating a people's health movement, care should be taken to look at the objective social, economic and political conditions under which the majority of the people live. Therefore, health

also is a means through which the majority of the poor should be helped to come out of their social and economic backwardness. The Convention underlined the need for a new outlook among the medical practitioners. There is need for a debate on the ills of the existing system and the search for alternatives in satisfying the health requirements of the people. There exist a number of voluntary groups, both national and international, who have been working towards an alternative health care system capable of reaching the poorest sections in the society. With the material already available, a well thought out document giving an alternative approach to the present health care system should be prepared and circulated among the medical practitioners and others connected with it. At the same time, a meaningful discussion on the various health sciences should be initiated so as to relate them to the objective conditions of the country. In such a discussion, the preventive and curative aspects and also the urban and rural orientation of different systems should be brought out. The example set by the People's Health Centre in Bangladesh was highly commended and the Convention felt that that example should be subjected to a closer study and analysis as it offers a great deal to those who are concerned with people's health.

The awareness that research in science and technology must be of relevance to people's needs led to the question: Who are the people? Since the irrelevance is mainly in relation to the poor people, the groups identified in answer to the question are the following: agricultural labourers, poor and small peasants, rural artisans and craftsmen and the urban workers.

It was recognised that a reorientation in the direction of research in scientific and other 'establishments' towards the needs of the people is not possible unless a radical social change takes place. But in the meantime scientists, who are aware of the misdirected and irrelevant research, have an important role to play in breaking the total isolation of the 'establishments' from the people. For this purpose, it is necessary above all for scientists to reject the elitist idea that they can solve people's problems from 'outside' and instead be prepared to learn from the people and from their perception of the problems. This would require a vigorous interaction between scientists and the people.

Considering the social and political constraints which operate in our society, it was also recognised that there are limits to what the scientists can hope to achieve through their commitment to relevant research. From this point of view, a distinction has been made between the generation of technologies appropriate to people's needs and their actual implementation and diffusion. The generation of technologies suited to the needs of the people and within their means was recognised as an important first step in the struggle for their implementation, for such knowledge about the existence and technical feasibility of means for raising the living standards of the poor people is important to the process of the struggle itself.

This led to the question of the political struggle and the necessity for scientists to establish communication with mass movements encompassing both political parties and such organisations as the KSSP. Accordingly three forces — scientists committed to research on people's needs, voluntary groups such as those represented at the Convention, and mass movements of the people — were recognised as the three constituent elements of a movement for bringing about the desired change in research. Mutual interaction among the three groups will not only bring 'relevant' problems of research to the forefront but also ensure that struggle takes place in favour of solutions offered.

The 'problems' of the people vary from region to region. An action programme, however, can be thought of in terms of the basic needs: those relating to housing, domestic energy, health and craftsmen. The precise content of the underlying research must be left to the people and the scientists working with them.

The slogan 'Science for Social Revolution', adopted by the KSSP raised many questions that deserve serious study. A theme paper on the subject (which follows) dealt not only with the role that science movements can play in bringing about radical social change but also with the precise character of *the movement in Kerala. While accept*ing modestly that the KSSP is a mass movement only in the sense that it reaches the masses on a wide scale, those associated with the KSSP noted also that there are trends within the movement which could make it revolutionary in orientation.

It was for the first time that a number of voluntary groups came together in a common forum to discuss questions relating to their involvement in the process of social and economic change and share their experiences. The very act of coming together was a rewarding experience for many.

Science for Social Revolution: The Kerala Experiment

Md Anisur Rahman

THE purpose of the following is to stimulate reflection and investigation about a phenomenon which deserves serious study to answer the many questions it raises.

SEEDS OF AN INTELLECTUAL AWAKENING?

A convention of this scale on 'people's science movements' is a significant event. It asserts that a culture of 'people's science' is emerging, or at least is seeking to emerge, in this region in South Asia; that knowledge created in institutions alien from the people is returning to the people. It may be questioned whether this has yet taken on the character of a 'movement', except in Kerala where a mass movement of scientists to go to the people *is* indeed visible, and the slogan 'science for social revolution' has been popularised. But it may be questioned what kind of 'social revolution' such a movement can be expected to promote.

Last August an account of the people's science movement in Kerala was presented by the convener of this convention to the cadres of poor peasants' movement and organisation in Maharashtra engaged in intense struggle with moneylenders for liberation from bondage, for reclaiming land illegally alienated to the latter, and for obtaining legal minimum wages. The cadres asked: "what is the relevance of such initiatives for the poor's struggle against exploitation"? The same cadres had been asked earlier how much conscious attention their organisation was giving to the development of productive forces in their area. To this they had replied that this was an academic question: their struggle at this stage was political, and the oppressed peasants would take to productive initiatives *only* when they would see the need for them to fight this political struggle; moreover, this consciousness would have to emerge from their concrete struggle and not from abstract analysis.[1]

As against this the popularity of the science movement in Kerala among the masses of its people is perhaps beyond doubt. Apparently, the masses are seeing in it a means of satisfying some of their felt needs — perhaps an access to knowledge that they must be seeing as useful in terms of their current aspirations. Whether this is true of the entire cross section of the masses in Kerala, in particular of the poorest strata of its society, may be questioned. The general popularity of the movement does *nevertheless* suggest that there is a basic difference between Kerala and other areas in the sub-continent, which has generated and sustained such a science movement here and not (yet) elsewhere.

The two situations touched upon above are perhaps two extremes. Other 'people's science' initiatives on smaller scales have been taken in other parts of the sub-continent, and a number of these have been sustained over significant lengths of time. Whom they are benefiting, and exactly in what way, are questions for in-depth investigation. But does one discern in these various initiatives the seeds of some kind of an intellectual awakening, a search for a new identity emerging from among the intelligentsia, manifest in a common urge to go to the masses of the people and seek to be of direct service to them as intellectuals equipped with *scientific knowledge* and a power of scientific analysis?

THREE TRENDS

In terms of the objective conditions prevailing in the region the generation of such an awakening is not surprising. The typical syndrome is: (a) perpetuation and aggravation of mass poverty; (b) continued polarisation of property, income and privileges through openly exploitative and often oppressive processes; (c) failure to develop the productive forces particularly in the rural society, notwithstanding continued advancement *of science and* technological knowledge; and (d) humiliating dependence on foreign aid, embodying among other things foreign knowledge and technology.

Intellectual frustration under such conditions may not be surprising. A people-ward intellectual movement under such conditions, however, can have an indeterminate combination of the following three trends: humanitarian; nationalist, and radical. A mixture of these three trends can in turn generate a variety of 'people's science' initiatives:

(a) *Frontier challenges*: going to the people and enquiring what their material needs are, and applying scientific and technological knowledge to meet them at costs within the means of a greater number of people;
(b) *Knowledge transfer*: mass education in science and technology;
(c) *Stimulating mass creativity*: working together with the masses to devise 'appropriate technology', in the process stimulating technological creativity of the masses;
(d) *Technology as a tool in political struggle*: devising technology to serve as a tool in the political struggle of the exploited masses against their exploiters; more 'self-reliant' technology from the point of view of the poor, through which they may have greater control over the production process;
(e) *Conscientisation*: seeking to raise the capacity of the poor to analyse their environment scientifically and bringing to them scientific knowledge of wider reality to help them take appropriate courses of action to change reality in their favour.

As far as appearances go, the first three varieties are consistent with the first two trends (humanitarian and nationalist). The third of these may not be inconsistent with the radical trend and may be seen to overlap with the fourth. The fourth and fifth are explicitly radical (note however that 'conscientisation' in improperly motivated hands can be reactionary or reformist, aimed at preserving or marginally improving, the societal *status quo*).

FROM ISOLATED INITIATIVES TO MOVEMENTS

None of such initiatives can have any social significance as long as they are limited to isolated efforts of local *dimensions*. *If they* do develop into wider movements, however, they introduce a new social culture and mode of social communication. The result can be socially significant, and may even go beyond the intended or apparent motivation of the initiators by generating new social dialectics which may take courses charted out by its own momentum.

To develop into a movement such initiatives require (a) appropriate subjective conditions in terms of (i) urges among the intelligentsia to go to the masses, and (ii) urges among the masses that respond to the specific initiative that the intelligentsia choose to take; and (b) objective conditions that make it possible for these initiatives to fulfil *significant aspirations* of the

cases. For example, an 'appropriate technology' may be devised or knowledge and skills acquired through scientific education; but these may not be marketable on a wide scale until there is a fundamental change in the pattern of income distribution. On the other hand, attempts at political 'conscientisation' may fail because the masses do not see social contradictions to be sharp enough to give priority to political action over, say, economic action that could immediately benefit them and for which there may still be room.

The Movement in Kerala

To what kind of 'social revolution' the people's science movement in Kerala may contribute? By its explicit objectives and what reports we have,[8] it includes more of the first three varieties than the last two. If the movement is widely popular, it apparently satisfies the subjective conditions (i) and (ii). These subjective conditions themselves should in turn be rooted in the objective reality of Kerala: there is poverty and there is exploitation; but is the state of exploitation so acute, the situation so oppressive, that the masses feel they have no hope in the social system as it is evolving? Note that there has been a succession of effective reforms in the state in the recent past and the transition from feudal and semi-feudal production relations to capitalism is at a relatively advanced stage. Once capitalism really emerges, the situation does not become immediately 'revolutionary' again: there is room available for the development of productive forces without another change in social relations. Furthermore, income and consumption disparities, the difference between town and country, in short, the gap between privileged and underprivileged — these seem to be less in Kerala than the general situation one sees in the rest of India. If this reading is correct, then the situation in Kerala today is not 'revolutionary' in the classical sense. Does this explain why people's science initiatives without a political struggle content are finding response among the masses in this state? Is it that the masses aspiring only to be better incorporated into the emerging capitalist system find in the science movement an easier access to the knowledge and skills that they feel they need to fulfil this aspiration?

I leave it to those more familiar with the situation in the state, and to more scientific investigation, to answer these questions. On these answers will rest the character of 'science for social revolution' that is in the cards in Kerala within the near future. If the situation is not ripe for another structural change yet, the only 'revolution' that can occur is a cultural one, culture conceived in its broadest terms including technology and the modes of social communication. Such a cultural revolution could speed up the process of 'quantitative development' of the society by broadening the base for creative initiatives that a scienticisation of mass culture and an integration of the intelligentsia with the masses could provide. In a process of capitalist development, this would essentially mean an alliance between the bourgeoisie and the direct producers to share the responsibility for innovation (as a trade-off for a wider sharing of the benefits of capitalist development that the socially conscious masses insist on getting). As a by-product, this may also make capitalism in Kerala more humane, where people would care more about people.

In thus speeding up the process of 'quantitative development' such a cultural revolution may contribute to the advancing of a subsequent 'qualitative transformation' of the society. But it would be too early to speculate on this at this stage.

Bringing the intelligentsia to the masses can have another by-product in reducing the distance between intellectual and manual labour, a fundamental class division in societies that has transcended many structural transformations. The accomplishment in this regard will vary according to the nature of the initiatives taken: the taking on of 'frontier challenges' to help the poor implies only a tangential contact between the intelligentsia and the masses, and the basic division of labour and its premises remain; so is it in the case of initiatives to transfer scientific knowledge to the masses. Possibilities of greater integration of intellectual with manual labour are however generated in initiatives of the latter three varieties.

Science in More 'Revolutionary' Situations

Elsewhere in India the situation is different. To go to the other extreme, what is the role of the intelligentsia in situations where the state of exploitation and oppression is acute, and a pre-capitalist mould prevails in which productive forces are unable to develop further, short of major structural change? The objective situation then is revolutionary, and the task is to mobilise the people to make the revolution. The enormity, and the many dimensional challenge, of the task is unquestionable. But, and precisely because of this, a scientific (intellectual) input into the process is critical. What should however be the character of this input?

Here ideas, as well as practices, differ. One trend assumes that intellectuals know 'what is to be done', and 'revolutionary intellectuals' have to mobilise and lead the masses for structural change and social reconstruction. While structural change may thereby be accomplished, the question remains whether dependence of the masses on the intellectuals will not continue, and the fundamental objective of radical action, namely, to liberate and develop creative mass energy, will not be frustrated; and whether, fundamentally, the alliance between 'revolutionary intellectuals' and the masses to accomplish structural change will not split later into a new class division, with the intelligentsia (technocracy) ruling and deciding things for the masses.

The other trend, perhaps still in the process of emerging, believes that the process of bringing about structural change is as important as the change itself, and this process should be dominated by conscious and organised mass action if structural change is not to degenerate into elitist rule by technocracy over the masses. The fundamenal task of revolutionary intellectuals with this perspective is to initiate process of conscientisation and organisation of the masses through which not only structural change may be accomplished, but conscious and organised mass power countervailing to the formal power of institutions, offices and specialists entrusted with specific tasks may also be created with the capacity to resist the abuse of such formal power.

Neither of these two trends is practised in its purity, nor is this possible to do so in reality. The first — elitist trend in revolutionary practice — is usually mixed with spontaneous mass initiatives in response to events that go beyond leadership or central designs. The second trend — mass-line in the very process of mobilisation for structural change — has to compromise in reality with the need for centralist impositions according to exigencies of circumstances. But 'revolutionary intellectuals' need to clarify their ideas as regards their basic commitment which will determine their strategy

where there are options, and this is essentially a choice between leading the masses towards social revolution and raising the capability of the masses to make one, in alliance with the intelligentsia but not in subordination to them.

The role of science in raising mass capability to make a social revolution is critical. It consists, first and foremost, of generating a scientific attitude and culture of scientific enquiry among the masses, so that they can move from sensory perceptions of their social experience to conceptions and analytical frames and from fatalistic prejudices to a realisation of their power to change reality in their favour; adopt systematic methods of investigations of their problems; learn to synthesise experience and consider alternatives systematically. The second important role is to bring to the masses systematic knowledge of the wider social structure of which their immediate environment is an organic part but to which the masses are less exposed, a knowledge that is critical in choice of strategy for social action. A third is to bring to them the experience of initiatives to change society taken elsewhere.

When combined with such a role, initiatives to develop 'appropriate technology' analytically determined jointly with the masses, in accordance with the requirements for the struggle for social change, can be of considerable value. Struggle for social change is a hard course to take, and a combination of economic initiatives to give greater staying power to the masses in this struggle, if possible, will certainly help. Search for 'appropriate technology' with this political perspective is therefore valuable. The involvement of the masses in technological innovation — if there is scope and time for it in their struggle for social change, or still better, if they are stimulated in this by the struggle itself — may be even more valuable, by demonstrating to them that it is in their power not only o change the social reality but the physical reality as well, thus giving them a consciousness and personality that may stand them in good stead if there is a [illegible] of technocracy taking over the [illegible] the new social system.

[illegible] is a vast country, and the objective situation in various areas differs widely. What is the appropriate role of science in people's development in situations which are less clearcut than either of the above — for example, in situations where exploitation and oppression is acute but room still exists for economic (technological) initiatives to improve the material status of the poor, at least upto a point? Many persons will deride such initiatives as 'reformism'. But can the masses be easily mobilised for exclusive political action for structural change if scope for economic improvement within the existing structure still exists? Should progressive forces stand aloof allow such opportunities to be siezed by real reformists thereby distracting mass attention from the need for fundamental social change for a more sustained improvement of their lives? Or should a combination of economic and political mobilisation be attempted, which would hence give wider scope for people's science initiatives to apply a fuller kit of its tools?

The Movement Must Continue

While these questions are debated, the 'people's science movement' should continue. This for three reasons: first, the debate would be abstract, at the level of mere intellectual gymnastics, if it were confined to conventions and seminars amongst intellectuals only. The people must be involved in the debate, and for this alone the intelligentsia must go to the people and discuss with them how best they can contribute to a revolutionary release of people's creative energy. Secondly, the debate must also be rooted in social practice; initiatives have to be taken in order to find out what kind of initiatives would be most appropriate. The process of life and social dialectics is dynamic and no static knowledge is appropriate to steer it towards progress; one must learn to take the best feasible initiative to start with according to existing knowledge and reality, and adjust action thereafter to new knowledge and changes in the course of reality that the initiative itself may generate. Finally, 'revolutionary intelligentsia' is not a closed, static set either: it is a set that is continuously created and recreated by social processes, through which new elements are added and some old ones become obsolete. If elite intellectual life itself is producing 'drop-outs' who seek an identity with the struggle of the oppressed, one may expect only more of such consciousness to emerge in intellectuals from a direct contact with the people. We have been told that in the Kerala science movement itself scientists initially motivated simply to transfer knowledge to the people have started seeing the social dimensions of the problem of mass poverty. Seeing the real dimensions many will undoubtedly fear to 'cross the line'; but some will, and 'one will split into two', as in China's 'May Fourth Movement, releasing a stream that will reinforce and enrich the revolutionary trend.[3] Such positive potentials of the process will be larger, the larger the movement can become, besides the direct positive contents of such a movement as suggested earlier (broadening the base for creative initiatives and reduction of the gap between intellectual and manual labour). It is difficult, indeed, to think of a richer cultural base for a social revolution than a massive contact of the scientific community with the broad masses of the people.

Notes

[This paper, written in the author's personal capacity, was presented at the All India Convention of People's Science Movements, Trivandrum, November 10-12, 1978.]

Stovec Screens India

STOVEC SCREENS INDIA has turned out good results for the fifth year ended September last, with a gross profit of Rs 35 lakhs against Rs 21 lakhs in the previous year following higher sales of Rs 92 lakhs against Rs 66 lakhs. Net profit is even more impressive at Rs 26 lakhs (Rs 12 lakhs), for as yet there is no tax liability in view of the brought forward unabsorbed depreciation and development rebate and claim under section 80 J of the Income-tax Act. This outcome has occurred despite lower production of 26,787 metres of perforated rotary screens as against 29,340 metres produced last year and the installed capacity of 48,000 metres per annum. The company is diversifying into manufacture of photosensitive chemicals and lacquers and has obtained an industrial licence as also a licence for the import of basic ingredients required in their manufacture. Regular production is expected to commence shortly.

Search for Stable Exchange Rates

Ramesh Jaura

WHEREAS West German Chancellor Helmut Schmidt and French President Giscard d'Estaing have reason to rejoice over the coming into operation of the European Monetary System (EMS) on January 1, as scheduled, Indian officials in Bonn and Brussels fear that the new system will have adverse effects on the value of Indian exports to the EEC. In fact, the EMS has been causing concern not only to India and other underdeveloped countries but also to the US.

At the heart of the EMS is the European Currency Unit (ECU). The ECU is a basket of currencies, the amount of each currency included reflecting the distribution of trade between the members of the Community. The Indian fear is that the introduction of the new accounting unit would negatively influence the quotas reserved for the country under the general scheme of preferences (GSP). Details of such effects are being studied by the Indian mission to the EEC at Brussels. Official sources are, however, optimistic that the expected adverse effects could be neutralised by pressing for an increase in quotas, particularly those for textiles, sea food and tobacco.

The EMS is more or less an exclusive creation of western Europe's two major countries, West Germany and France, which have been coming closer to each other for reasons of their own. Both Schmidt and Giscard want western Europe to play an important role in the world, conforming to its growing economic strength. An effective first step is to defend the western European currencies against the vagaries of the dollar. By promoting currency stability, they hope to create a climate of confidence for investment and economic recovery in the EEC countries.

Bremen Blueprint

The idea was initially discussed at the EEC summit in Copenhagen last April between West German and French leaders. The fact that other EEC partners were not consulted gave rise to much resentment. However at the EEC summit last July in Bremen, the Nine agreed to draw up a blueprint for maintaining exchange relationship between the EEC currencies that wanted to participate in the proposed scheme. Britain and Italy expressed reservations, though they did not oppose the plan. The Bonn economic summit of the world's seven topmost industrial nations did not go farther than taking notice of the blueprint evolved at Bremen.

The Bremen blueprint was further discussed at a Franco-German summit in Aachen, which resulted in a compromise on the exchange rate mechanism. A broad agreement on this compromise formula was reached among the EEC finance ministers when they met in Brussels in mid-September. The sole opponent was Britain whose Chancellor of the Exchequer, Denis Healey, seemed quite taken aback by the turn of events, especially as he was under the impression that the French supported the British view.

The Franco-German compromise accepted by the finance ministers combined elements of two proposals under consideration for linking EEC currencies. The first, known as the 'basket system', envisaged denomination of currencies in terms of floating unit such as the European unit of account. The second envisaged a 'parity grid' in which currencies would be linked directly. The basket system was initially advocated by Britain, France and Italy. The parity grid was urged by West Germany and Netherlands.

The compromise proposal generally accepted in Brussels leans closely on the previous mechanism — the 'snake' of jointly floating currencies. But at the same time it seeks to prevent at the outset the possibility of weaker currencies dropping out as they did in the case of the snake. This is sought to be achieved by using the basket system as an 'early warning system' which would necessitate consultation between monetary authorities without automatically leading to intervention. Such intervention would be determined essentially by upper and lower limits of fluctuation fixed in parallel parity grid. However, once one currency reaches its upper limit and another automatically the lower, monetary authorities responsible for both currencies would be obliged to intervene.

The decision on EMS is undoubtedly the most important decision of its kind since the Bretton Woods System agreed in 1944 broke down in 1972. But there are quite a few even outside Britain who question the wisdom of regarding floating exchange rates as the root of world economic problems. The talk about 'stable rates', they point out, is in fact nothing but [illegible] fixing [illegible] rates by a political [illegible] of a market process.

No Panacea

Further, the fervent supporters of stable exchange rates theory as a panacea for international economic problems are all persons who were finance ministers at various stages of the breakdown of Bretton Woods. All of them took some personal knocks as the old system crumbled and now see it as a lost paradise. These leaders, it is pointed out, tried to be their own economic advisers. The finance ministers did not attend the early December summit in Brussels which decided to give birth to the EMS.

There is indeed a lot of relevance in this criticism. Even if the EMS should succeed in stabilising the exchange rates of western Europe's leading countries the basic imbalances in the international economy would remain. Developing countries of western Europe would continue to suffer at the hands of more advanced countries. Their problems could be solved at best only partially by borrowing from the more advanced countries like West Germany or from the European Monetary Fund which is to be set up in the next two years. The gap between the trade and level of economic development of the rich like West Germany on the one hand and Italy, Ireland as well as Spain, Greece and Portugal at a later stage, when they join the EEC, on the other, would continue to widen.

Instead of a two-tier Europe of which Schmidt and Giscard would perhaps go down in history as architects the coming years would see at least a four-tier Europe, divided among the rich, the less rich, the poor and the poorest. The European Monetary System, even if it succeeds, would put all but a break on this pending division.

Besides, it is doubtful if the EMS in operation would succeed in achieving European unity which EEC has been striving in vain for the last 20 years. Whether on economic, fiscal or political issues, the Nine are not prepared to forgo their national ego for the sake of larger continental interests. Britain has shown that during the course of the birth of EMS. But Britain is not the only defaulter. The French who since the days of de Gaulle have been zealous advocates of greater independence for western Europe *vis-a-vis* the US are all but prepared to shed their national pride in favour of a genuine European unity. Despite all that Jacques Chirac has to say about France's sell-out, Giscard has shown himself to be a tough bargainer on the EMS.

Beyond the 'Islamic Republic'

In the continuing, irreversible revolutionary explosion of the Iranian people it is becoming more and more impossible to deny both the spontaneous readiness of the people to fight against the Shah — which is what gives the struggle its breadth and tumultuousness — and the existence of organised Marxist revolutionaries who are giving it a disciplined backbone.

Yet the Western press has been trying. From beginning to end the people's struggle has been depicted as one guided by emotions of religious fanaticism, directed as much against the Shah's 'modernisation' programme as against his tyranny. Martin Wollacott in the *Guardian* agonises about the paradox that "blue-jeaned girl students follow the flags of a religious movement which, if it could, would thrust them back into the homes from which they have only just escaped" (November 28, 1978). Iranian society is pictured as one of depoliticised mutually hostile classes — a small cosmopolitan elite whose liberalism the Shah unfortunately gave no scope to, an alienated and traditionalistic petty trading class, an atomised proletarianised lower class thrown off the land and festering without expression in the cities — all of them with presumably nothing to organise them or hold them together but religion. The conclusion? The Shah must be clung to, at least for some time until a more viable alternative can be built up; or else there will be chaos and a wave of Muslim fanaticism or military dictatorship worse than "the relatively innocent variety now imposed".

Who and what forces are in reality presenting the opposition to the Shah? Muslim traditionalism is only part of this, in spite of the fact that the main political personal alternative to the Shah at present is a religious leader, Ayotollah Khomeini, an intransigent, orthodox, anti-Western leader of the millions of Shia Muslims. Khomeini has indeed defined his ideal as that of an 'Islamic Republic' and in interviews reproduced by his Iranian supporters has firmly repudiated any alliance with any sort of Communists: "We will not collaborate with the Marxists even in order to overthrow the Shah... We are opposed to their ideology and know that they will always stab us in the back."

Why really is such a man unacceptable to the West, which has learned to accommodate very well the anti-Communist 'Muslim fundamentalists' of Saudi Arabia and elsewhere? The reason is that if Khomeini does indeed 'come to power' he himself will be unable to control the revolutionary ferment among the people.

Khomeini recognises this, which is why he is forced to speak in the language of democracy. "Our ideal is the creation of an Islamic state. Nonetheless our first concern is the destruction of this autocratic regime.... In the society that we wish to establish the Marxists will be free to express themselves, because we are convinced that Islam has the answer for the needs of the people". These are brave words, but in fact Khomeini can do little else, cannot prevent the Muslim masses he claims to lead from collaborating with revolutionary guerillas, can do nothing else if he replaces the Shah than to allow the democracy that is the minimal demand of the people.

It is irrelevant in the present conditions whether Khomeini himself wishes to put women back under the veil, deprive the West of its oil supplies and investment outlets or whatever. What worries the Western powers is his inability to hold back the revolution. And that revolution, fuelled by the hatred of the people for the Shah's tyranny, by the frustration of the Muslim petty bourgeoisie and the revolt of the growing Iranian working class against their hitherto unchecked exploitation, is a revolution that has been and is being organised by revolutionary guerillas.

The revolutionaries of Iran — the 'communist extremists' whom the Shah constantly accuses of allying with Muslims in a red and black reaction' — are not the Iranian Tudeh Party (the "Masses" Party, i e the official pro-Moscow communists) The Tudeh party has little standing inside the country, having functioned almost entirely in exile since the coup against Mossadegh in 1953, and has been unable to maintain any real links with the masses. Even its Maoist splits took place in exile and the 'Marxist-Leninist' organisations have also developed entirely abroad, though they have tried to implant guerillas inside the country. The result is that while the 20,000-member Iranian Students Association in Europe and the US was split five ways over debates about whether the US, the USSR or both superpowers were the 'main enemy', the revolutionaries in Iran functioned without paying them much attention.

The two revolutionary organisations that count today are the Fedayeen (Guerilla Organisation of Devotees of the People of Iran, or *Chirikha-ye-fadayee-i-Khalq*) and the People's Combatants (Iranian People's Combatant Organisation, or *Mojhidin-i-Khalq*). Neither organisation has extensive international contacts (except with some Palestinian groups and the revolutionaries of Dhofar, the latter of whom they aided when Iranian troops were sent to put down that revolution) or publications Formed in the late 1960s in an utter vacuum of any functioning communist movement, they are new revolutionaries, with respect for both the Chinese and Russian revolutions but not bound by the organisational hegemony of the parties which now speak in their name. The fact that some publications now describe them as 'Regis Debray' type groups only shows the inability to conceive of an autonomous revolutionary development. Basing themselves on Marxism-Leninism, they have nevertheless developed autonomously in the new condition of societies in the grip of post-colonial imperialism.

The two organisations have their differences. The People's Combatants were founded first, in 1965, as an 'Islamic Marxist' organisation but have become progressively less bound by Islams while the Fedayeen have described themselves as Marxist-Leninists from the beginning But the two work closely together and share a common orientation to the necessity of armed struggle. The rationale for organising as a guerilla fighting force was clear: only a power which could strike some blows against the regime could grow, and a communist organisation which held back from action under the theme of 'survival' and 'preserve the cadres' would have no contacts with the masses, would not grow, would be guilty of liquidating the party. And the only kind of blows that could be struck against the Shah's dictatorship were armed ones.

The guerillas were never under any illusion that their 'small squad' activity would lead to immediate mass uprisings. Rather, as it was put in one of the few surviving articles by Amir Parviz Pouyan, a Fedayeen founding member, the beginning point was the utter isolation of revolutionary intellectuals from the workers: "Our situa-

tion is not like the example of fish living in the sea of the peoples' support. Rather, it is the case of small and scattered fish surrounded by crocodiles and herons". But the reason for the isolation was not simply the repressive apparatus of the Shah, but the culture of helplessness and alienation it had created among the workers who remained 'manageable sheep' because they saw no way to act. In this situation continuing guerilla blows delivered by even a small vanguard would not merely demonstrate to the proletariat that the vanguard could act, but would stir the proletariat to a consciousness of its own power and break the hold of the oppressive culture which pictures the enemy as absolute. "The proletariat will think of the vanguard with passion not only because it sees that, for its sake, a small group has gone into battle with an enemy equipped with an extensive arsenal, but all the more so because it sees its own future directly aligned with the future of this group.... The spell breaks and the enemy looks like a defeated magician."

So wrote Pouyan, only some months before the first guerilla actions were initiated and defeated in the forests of northern Iran and only about a year before he himself was killed in action in a gun battle in Teheran. But it is clear that from the beginning the revolutionaries saw guerilla activity not as an alternative to organise the working class on its immediate economic as well as political and cultural needs, but as a way of organising the working class. And it is also clear that the present explosion taking place among that working class, which has put forward political demands (time for study classes in their factories; release of political prisoners) as well as economic ones, is a vindication of the willingness to fight of the early isolated few.

Both the Fedayeen and the Peoples' Combatants see themselves as working towards the formation of a revolutionary party and are still developing their full political line. Both see the Soviet Union as revisionist, but consider US imperialism and the Shah to be the main enemy. Apparently the Peoples' Combatants tend to emphasise the 'semi-feudal' nature of Iranian society more than the Fedayeen do. The latter have put forth a brilliant critique of the Shah's 'agrarian revolution' in which they argued that feudalism in Iranian agriculture was indeed destroyed, with the result that impoverished peasantry were driven off the land to constitute a proletarian reserve army available for capitalist exploitation — and also for revolutionary mobilisation. According to this pamphlet, the Shah and the ruling class are a 'comprador bourgeoisie'; thus this event (the Shah's 'agrarian revolution') consisted of 'imperialism (i.e, via the compradore bourgeoisie) destroying feudalism'. This is not an orthodox position according to any traditional Soviet or Chinese analysis which continues to treat such an event as an impossibility by definition; thus though the Fedayeen are using orthodox terms such as 'comprador' and 'national' their analysis appears to have been moving in a different direction.

The Fedayeen and the Peoples' Combatants not only survived the years of tyranny and the unspeakable tortures of SAVAK, but have continued to grow and develop their skills of organisation. How much they have been behind the current upsurge is, in the nature of things, impossible to say. But whoever has some familiarity with not only the fighting spirit but the very culture of secrecy and the organising ability of Iranian students abroad should have no difficulty in suspecting that some oganisation lies behind both the repeated, massive street demonstrations and the concurrent working class strikes which have halted oil productions and are causing nightmares to international capital.

It is also unclear how the guerillas will cope with the situation if Khomeini should form a government and a period of 'democracy' should actually come into being. How will the previously underground groups functioning in an atmosphere where no dissent could be expressed deal with the need to create an open, clear revolutionary political alternative? However, their ability should not be underestimated. Already the released prisoners — whose release was demanded by mass demonstrations and oil workers' strikes — are on the streets and the fighting people have become able to see starkly and fully just who has been fighting for the last ten years and what the cost of that fight has been. It is no wonder, perhaps, that the Western powers as well as various elements of the Iranian upper classes, including religious 'moderates' and liberals, are trying to cling to the Shah. The alternative they fear is not that there is too much chaos in Iranian society, but that it may be very well organised indeed.

DOCUMENTS

Levels of Food Consumption

IN response to a request from the Food and Agriculture Organisation (FAO) for its project to collect information on levels of food consumption in different countries, the National Sample Survey Organisation (NSSO) took up the tabulation of NSS consumer expenditure data for providing estimates of calorie intake of the people of different states in India from the information on quantity of different food items available in NSS schedule of enquiry on consumer expenditure. The results were based on the consumer expenditure survey of the NSS 26th round (July 1971-June 1972). The complete set of results have been published (NSS Report No 238) in two volumes. Volume I contains the technical details of the survey, the procedure adopted in deriving the results presented in the report and the results for the rural areas and Volume II contains the corresponding results for urban areas. The summary of findings of the report is reproduced below:

The average number of persons per household in India was 5.26 (5.39 for rural and 4.72 for urban). Correspondingly the number of consumer units per household was 4.29 for rural, 3.81 for urban and 4.19 for all-India.

The ratio of number of consumer units to the size of a household was found to be fairly stable — fluctuating within a very small range about the value 0.80. So for all practical purposes 0.80 may be used for conversion from per capita to per consumer unit or *vice versa*. At the all-India level, the ratio was 0.79 both for the rural and the urban areas in the lowest per capita expenditure class (Rs 00-15) which slowly increased with expenditure level and assumed the value 0.81 in rural areas and 0.84 in urban areas at the highest expenditure class (Rs 100 and above per capita per month).

At the all-India level the average calorie and protein intake per consumer unit was found to be 2,719 cals and 77 gms, respectively. While the calorie intake was slightly lower than the minimum requirement of 2,750 cals per day per consumer unit, the level of protein consumption was considerably higher than what is considered to be the minimum requirement. Thus the estimates show that the total food used for domestic consumption could provide nearly the minimum energy requirement for the population as a whole. From the results it is also observed that the major part of the nutrients is derived from the first two

TABLE

	Rural			Rural		
	Percentage of Households Consuming less than 2700 Cals	Intake of Calories		Percentage of Households Consuming less than 2700 Cals	Intake of Calories	
(1)	(2)	Median* (3)	Mean (4)	(5)	Median* (6)	Mean (7)
(1) Andhra Pradesh	54	2588	2666	61	2508	2617

(22) Pondicherry	66	2343	2391	56	2533	2410
(23) Tripura	47	2751	3027	51	2691	2857
(24) All-India	49	2730	2724	56	2584	2699

* Computed by applying. Lagrange's interpolation formula to three consecutive cumulative percentages of households by per consumer unit per day calorie intake groups.

food groups which are mainly composed of foodgrains — cereals and pulses. So, from the observed results, it can be inferred that the quantity of foodgrains actually consumed by the population of the country could almost meet the minimum requirement. Some further studies are however needed before any firm conclusion could be made. In spite of this, it is also observed from the results that a large section of the population in most of the states do not get enough food. The real problem seems to be distributional imbalance where more food than necessary is consumed by some, while a good number of persons are forced to remain satisfied with inadequate food which they are able to procure for their consumption.

It is well known that in our country, the major part of nutrients in food is derived from cereals and starchy roots. Of the total calorie intake, more than 82 per cent in rural areas and 71 per cent in urban areas is derived from cereals, starchy roots and sugar. This proportion declines progressively with rise in per capita expenditure level, both in rural and urban areas. For the other food groups, an opposite trend is observed. In urban areas, comparatively higher proportions of nutrients are derived from food rich in good varieties of protein (milk, meat, egg, fish, etc) while in rural areas the share claimed by the group 'pulses and nuts' was larger.

Proportion of households below the required level of calorie intake which has been taken to be 2,700 cals per consumer unit was found to be 49 and 56 per cent for all-India rural and all-India urban, respectively. Generally the proportion was low for the states where the average per consumer unit calorie intake was high. Rural areas of Haryana, Jammu and Kashmir and Punjab with high level of calorie intake (above 3,400 per consumer unit) had respectively 22 per cent, 13 per cent and 27 per cent of the households having per unit consumption below 2,700 cars per day. Kerala and West Bengal reported very low calorie intake of 1,928 and 2,250 for the respective rural areas. More than 70 per cent of households of these two states reported consumption less than the minimum level. Per consumer unit intake of calorie was above the minimum requirement in Gujarat (2,840), Haryana (3,450), Himachal Pradesh (3,038), Jammu and Kashmir (3,419), Madhya Pradesh (3,101), Punjab (3,437), Rajasthan (3,092), Uttar Pradesh (3,180), Delhi (2,935) and Manipur (2,941). On the other hand, the rural areas of most of the eastern and southern states of India reported levels of calorie consumption well below the minimum requirement.

The pattern was however slightly different in the urban areas. In general for the states where the calorie intake per consumer unit in rural areas was considerably higher than the minimum requirement, the corresponding level in the urban areas was much lower. Similarly states with low calorie intake in rural areas recorded higher intake in urban areas. Urban areas of Rajasthan reported the highest level of 3,006 calories per consumer unit among the urban areas of all the states. Although for Kerala, the per consumer unit calorie intake in urban areas was higher than that of the rural areas of the state, the level (2,103 cals) was much below the minimum requirement. The level of calorie intake was of the same order for all-India rural (2,724 cals) all-India urban (2,699 cals). Over the states, the distribution in urban areas thus shows much less variation as compared to variations observed over the rural areas of the states.

The Table shows the percentage of households consuming less than 2,700 cals per consumer unit per day, the median value (50 percentile point) and the mean calorie intake per consumer unit per day for the rural and urban areas of each state and union territory of India.

Standard Chartered Bank

STANDARD CHARTERED BANK's trading profit for the six months ended September 1978 improved to £ 67.2 million (Rs 108.5 crores), from £ 62.5 million for the corresponding period of 1977, an increase of 8 per cent. But for the appreciation of sterling against the currencies of many of the countries where Standard Chartered operates, the improvement would have been of the order of 17 per cent. After providing for taxation (£ 32.5 million), minority interests (£ 5.4 million) and extraordinary items, profits attributable to shareholders is £ 28.6 million (corresponding period last year £ 26.6 million). The Directors have declared an interim dividend of 8.5 pence per share (12.69 pence before tax) which will absorb £ 5.9 million, leaving £ 22.7 million to be retained in the Bank's books. The Standard Chartered Bank Group is the UK's largest independent overseas bank, with over 1500 branches in some 60 countries, and its Head Office is in London. In India the Bank operates as The Chartered Bank.

Steel Frame of Obsequiousness

C S

British Bureaucracy in India: Status, Policy and the ICS in the Late 19th Century by Bradford Spangenberg; Manohar Book Service, New Delhi, 1976; p 380, Rs 75.

BRADFORD has engaged the ICS in a strip-tease. A formidable achievement, no doubt; considering that few contemporary myths have found securer lodgement in human gullibility than the one relating to the Steel Frame. To talk of integrity and efficiency in connection with the ICS has for long been considered tautological. Surviving the Raj, the myth has been transmitted to the unlettered millions in the successor nation-states through oral local history. Possessing the intelligentsia also, it has wormed its way into learned treatises on the subject. Post-1947 continuation of the myth has, among other causes, much to do with the contrast between the *experienced* present and the *remembered* past.

Thus, to offer but a couple of examples, K K Aziz would have us believe that British India was better administered than Great Britain herself. (See "The British in India: A Study in Imperialism", Islamabad, 1976.) And for B B Misra — significantly, the only historian for whose assessment of the British Indian bureaucracy Spangenberg has some respect — the future of India would be determined by the extent to which it can extricate itself from its old traditions and move along the lines of rationality and morality provided by the imperialistic bureaucracy. (See "The Bureaucracy in India: An Historical Analysis of Development up to 1947", Delhi, 1977. But Spangenberg is relying on Misra's "The Administrative History of India 1834-1947" which, in terms of general orientation and basic conclusions, is not different from his full-fledged study of the bureaucracy.)

Holding on to some perspicacious insights offered by George Orwell in "Burmese Days", Spangenberg deals with, and demolishes, particularly three aspects of the ICS myth: its popularity, in Britain, as a profession; its administrative efficiency; and its self sacrificial *esprit de corps* which made the welfare of the Indian people the primary concern of the British Indian government.

A detailed examination of the problems and pattern of recruitment to the ICS shows that within eight years of the introduction of the competition system, recruitment "fell into a negative syndrome" from which, despite a variety of efforts from time to time, it "could never really lift itself". While contemporary critics lamented the decline in the class origins of the successful candidates, the real indictment of the competition system lay in the progressively depressing educational background of these candidates. Oxford and Cambridge, the "two great universities fell from a position of predominance to one of minimal significance in the competitive programme, while the percentage of positions gained by Irish youth remained relatively high and eventually surpassed that of Oxbridge students". The syndrome may be differently described: "In 1866, sixty-two per cent of the recruits held no degrees while in the following year the proportion of non-graduates rose to seventy-nine per cent." Restricted job opportunities in England rather than the attractiveness of an Indian career determined the quality of personnel.

If the human stuff that could be sent out to India offered a dim prospect, service conditions in India did little to mould it into something better. Maybe, the contrary. The system of officiating appointments and acting allowances produced what Spangenberg describes as "civilian transiency" or "mobility malady". As T C Hope put it: "Everybody is acting for everybody else." Apart from quoting a hilarious excerpt from an official file, Spangenberg concretises this general observation with the help of a table showing the number of times the charge of districts changed in a single year, i e, 1898-99: two times in 61 districts; three times in 49; four times in 27, five times in 23; six times in 6; seven times in 5, and eight times in 2. The evil was recognised. Remedies were known. But, because the possible remedies threatened entrenched civilian interests, the system remained unchanged.

Then there was the problem of provincial consciousness which produced a vertical stratification in the ICS cadre and generated what Ripon called "a bastard *esprit de corps*". This was particularly pronounced in Bombay and Madras. Aware of the relevance of this aspect of his enquiry to post-1947 Indian polity, Spangenberg relates his discussion to the work done by Paul Appleby on independent India's administrative system. But, apart from suggesting historical parallels, he is unable to indicate the course the evolution provincial consciousness took in accordance with the changing political scene.

If provincial consciousness created vertical stratification, inter-service rivalry within the ICS brought about a horizontal stratification that cut across provincial boundaries and affected the character of the Service within each province. While this stratification ranged from the district level to that of the secretariat, perhaps the most acrimonious division of this kind existed between the judiciary and the executive. Whatever the nature of stratification, efficiency was invariably the worst casualty.

All these, however, are the preliminaries of the strip-tease. The climatic operation is described in connection with the covenanted civilian's obsessive concern for promotion, prestige and status. His very psychological sustenance in a strange, noxious land came largely from visible periodical assurances of official approval in the form of promotion, transfer to a coveted station or titles. And, apart from social connections, what brought forth approval was obedience. "It would be bad precedent to reward contumacy", confided Hamilton to Elgin. This was a secret that was known to every civilian in India. Being ambitious and aware that subservience passed for loyalty, he soon learnt to act, at every level except that of the India Council which represented the ceiling of his promotion, as an instrument for his superiors. Hence Kimberley's warning to Dufferin: "In many cases you will get from your subordinates the advice they think will please you, rather than their independent opinion."

Spangenberg substantiates the calculated and opportunistic malleability of even the highest placed Anglo-Indian civilians with case studies, the most detailed and telling being his analysis of the behaviour of Mackenzie and MacDonnell during the chequered course of the Bengal Rent Bill. MacDonnell, for example, championed Ripon's pro-ryot Rent Bill and viewed himself as its saviour when poor Ripon "was getting anxious" "in the face of what he mistakes for public opinion". But when Dufferin decided to so amend the Bill as to favour the zamindars, MacDonnell

was at hand to reassure the new Viceroy "that exaction of excessive rents is not a charge which lies at the door of the Bengal zamindars as a class".

And MacDonnell, it is worth stressing, did not belong to the common run of civilians. Elgin saw him as "the only one among the higher officials who could consider views in a wider framework than his own personal ambitions"; and Curzon, despite his massive contempt for the ICS, singled MacDonnell out as one who "in this pigmy-ridden country ... at least has mental status". This man with mental status was not above slinging mud on persons for whom he was officiating as chief commissioner or lieutenant-governor in order that they might decide against rejoining and he might succeed them as a permanent incumbent. One can imagine how much more myopically selfish the pigmies must have been.

This was not mere human failure. As Spangenberg concludes, the "covenanted civilian did not live in a frame of reference conducive to an idealistic conception of his role". And, paradoxically, those at the helm of affairs who lamented the dearth of calibre and initiative within the ICS and were in a position to initiate reforms ensured the perpetuation of what Spangenberg picturesquely calls "the steel framework of obsequiousness". Here is a departure that provides a corrective to the existing historical perspective on bureaucratic behaviour in India.

Equally significant is the fact that the very bureaucrats who "trembled at the nod of the Viceroy" could, in the event of a real or imaginary threat to their security, stand up to him and frustrate his efforts either by disregarding an impugned measure or by so interpreting it as to make nonsense of it. The Ilbert Bill, local self-government scheme and Indianisation of the civil service are some of the cases studied by Spangenberg to illustrate the recurrence of bureaucratic recalcitrance.

Without writing from a radical perspective, Spangenberg offers at least one radical angle when he observes about the much vaunted rule of law: "There may have been less marauding under the British rule, but literate and powerful classes used the alien legal system in a subtle fashion to exploit and to undermine the position of those less knowledgeable or less powerful. Vast numbers of peasants or landholders had seemingly as little (perhaps less) security of land tenure under British law as under previous regimes."

In a work of such significance factual errors like the Raja of Benares being a Muslim and Dadabhai Naoroji a Bombay lawyer may be overlooked. So also, perhaps, its literally countless printing errors.

What is really perplexing is a recurring lack of clarity about the designs of the British Indian administration. We are told, for example, that beneath the impressive facade of the British Raj it was often the indigenous elites who actually ruled while civilian transiency rendered impossible the location and redressal of injustice. This assertion is made without reference to the distinct possibility that at the local level these 'petty' injustices were not intended to be redressed; a possibility that, interestingly enough, figures in Spangenberg's observations regarding the maintenance of the *status quo* with its delicate balance between the landlord, bania and the cultivator (*cf*, pp 74, 130, 188, 198, 213, 236). After all, the local elites, being wedded to the Raj, were not meant to be weakened.

Studying Politics in a Vacuum

Ignatius Chithelen

Party and Democracy in India by S N Sadasivan; Tata McGram Hill; pp 536; Rs 87.

THE book contains a vast amount of information including dates and places of origin of well over a hundred parties, brief accounts of the personalities involved in them, their purported aims, splits and factions. Hence it could serve as a useful source for data.

However in the analysis of data presented the right inferences are seldom drawn. For instance, in a chapter entitled 'Party and Finances' contributions made by some large industrial houses during the 1967 general elections are listed. Such donations and their fall-out ("leading entrepreneurs having a number of industrial undertakings like Birla, Dalmia and Goenka, long time sympathisers of the Congress, with their newspaper combines and chains, established stronger monopolies than before ...") should have had to lead to important conclusions about the functioning of democracy in India. But the author makes no such attempt. He states that the RSS believes in "the efficacy of unselfish and benevolent single supreme leadership ... No doubt the parties of Hindu persuasion have many things in common with fascism, yet there are in them many elements which are opposed to and despised by fascism". While the qualities that such parties have in common with fascism are listed those believed to negate their fascist tendencies are not mentioned. The appropriate conclusion is once again not drawn in this verbal tight-rope walking exercise.

The author asserts in his preface that the work has been hailed "as original and scientific in its approach, design, content and treatment". One would except a scientific study to correctly account for past events and, in the realm of politics, broadly outline the likely course of future events. In both these respects the book fails.

Several vital events in the Indian policy have not been satisfactorily accounted for. For instance, in states where the Congress could not form ministries, President's rule was imposed 10 times between 1951-66 and 22 times between 1966-73. This, the author says, is "a heavy imperialistic prescriptive" but he fails to see the connection between imposition of President's rule and the Congress party structure. "Taken by its form and content, the democratic nature of the Congress is found only in its ideological plane ..." But what does such a formulation mean when the author also writes that "the Congress has the unique capacity to create a state promising possession to the poor and to defend simultaneously, elements engaged in dispossession them"?

In the author's reasoning the imposition of Emergency was just a minor aberration that temporarily jolted the even flow of democracy in India. The brutal suppression of the railway strike in 1974, the rigging of the assembly elections in West Bengal in 1972 and the subsequent gagging of democracy there are among the important political events overlooked by the author. If India had indeed evolved a democratic polity since 1947 — this is the underlying assumption of the study — then the crucial question of how such a 'democratic' policy was so suddenly transformed into "asphyxiating authoritarianism" has not been answered.

The book also abounds in some absurd formulations. Thus, parties like the Jana Sangh are supposed to lack popular support in the South because "the South is endowed with a rational outlook .... In the discriminating eyes

of the South the Congress itself is a gigantic Hindu party ... the South, with its few concentrations of wealth favours by and large, a socialistic and egalitarian society".

The base weakness of the entire study is in theoretical framework. Tracing to India the path laid out by political sociologists like Duverger Bluntschli, Michels, Grazia and others, Sadasivan studies parties in a vacuum, ignoring the economic factors and their vital link to politics. In keeping with the structural-formal approach of most political sociologists, he postulates a theoretical edifice and then allocates to a party a fixed place in it. He has thus classified parties "horizontally" into 14 groups on the basis of their ideology — social democratic, Marxian, religiocentric and other groups. Each group is again sub-classified, this time "vertically", into major, medium, minor and sub-minor parties. Thus for example the Congress has been pigeon-holed as a major social democratic group.

The emphasis of the study is therefore almost exclusively on intrigues, factions, expulsions and mudslinging. The composition of the mass base of the major parties, the shift in voting loyalties and the reasons for it, the impact of these parties on state and national politics and their likely influence in the future and, most important of all, the threat of re-emerging authoritarianism or, more correctly, the authoritarianism ingrained in the policy of underdeveloped countries, are all issues that are avoided. Perhaps attempts to understand them would have meant disturbing the meticulously constructed theoretical edifice.

The study is thus more of the formal and superficial aspects of Indian parties rather than a deep analysis of their interaction in a fast changing political situation. The author takes pride in mentioning that the "work is amongst the first of its kind in political sociology". One hopes that very few will follow the lead.

Books in Brief

A Pugwash Monograph Based on the Symposium Held in Dar-es-Salaam, Tanzania June 2-6, 1975 edited by W K Chagula, B T Feld, A Parthasarathi; Ankur Publishing House, New Delhi, Rs 30.

TWO points need to be made. One is that the volume is important because it is a Pugwash Publication. Pugwash is a movement of scientists that had its origins in their distress over the cold war and the arms race of the late 1950s. Since then, its interest has shifted to other areas, but it remains a movement that, so far as issues of poverty and development are concerned, derives its importance from the individual eminence of the people that constitute it, rather than for any specific policy it stands for.

The second point pertains to the world view implicit in Pugwash on self-reliance. Self-reliance is seen as something that will result from international collaboration, especially co-operation among the developing countries. This is both romantic and utopian. Co-operation is desirable, but co-operation between the rich and the poor or between the not-so-poor and the poor, takes place, almost always to the detriment of the poor.

This is only to be expected because they belong to classes with conflicting interests, and the rich are the rulers. By missing this vital point, contributors to the Pugwash Symposium rely on intentions and statements, not on actual policies and results. The way to hell is indeed paved with good intentions — and academics must learn that intentions are not enough. And the Pugwash scientists, if this volume is any indication, have yet to take the lead in action

— Vinod Vyasulu

Joint Sector Projects : Concept, Problems and Projects edited by Majur C Shetty; Management Development Institute New Delhi, 1978; pp ix+123; Rs 20.

THE joint sector was the brain-child of the Dutt Committee on industrial licensing and policy. Joint sector projects have been mostly promoted by State Industrial Development Corporations (SIDCs) in collaboration with private industrialists. In a typical joint sector project the SIDC holds 26 per cent of the shares and the private sector collaborator 25 per cent. The Dutt Committee saw the *joint sector* as a device for ensuring a say to the public financial institutions in the private sector units assisted by them and for preventing private industrialists, the large houses specially, from building up industrial empires with the resources of the public financial institutions.

The publication under review comprises the proceedings of a seminar organised by the Management Development Institute, New Delhi, in December 1978 and attended mainly by representatives of the SIDCs and state governments. Though the participatants in the seminar constituted themselves into four working groups for "in-depth deliberation", the outcome, going by the summary of the panel discussions and reports of the working groups presented here, contained nothing that even a layman was likely to find new. The three formal addresses delivered, respectively, by the chairman of the Management Development Institute and the heads of two all-India term financing institutions are equally inane. Typical is the statement by the head of one of the term-financing institutions that a review of joint sector projects assisted by his institution had yielded the conclusion that the "performance of the joint sector was quite comparable with the performance of both the public sector and the private sector" What really is one to make of that?

The most, in fact the only, useful part of this monograph is the paper on the operational problems of joint sector projects by J Viswanatha Murthy Not surprisingly, the facts presented by Murthy do not square with the polite noises made by the grey eminence of the financial institutions. For example Murthy points out that while in theory the SIDCs are supposed to follow certain "rational criteria" (e g, local, resource endowments, employment potential), in identifying projects to be taken up in the joint sector, "it is not rare to come across examples when projects are selected on the arbitrary rationale of 'not being left behind' ". In this context, he quotes the following observation by a spokesman of one of the SIDCs: "We apply for a letter of intent because all the other states have already applied for and obtained letters of intent for that project. We applied for a TV project because other states applied for it; similarly we applied for a scooter project because other states had already obtained one; so also for nylon project."

And what about the objective of fostering new entrepreneurs and preventing concentration of economic power? Here Murthy's finding is that "in the cases of almost all the SIDCs interviewed for this paper, the private collaborators were invariably those with proven industrial experience".

On the whole, the main achievement of the joint sector has been to make it possible for private industrialists to [illegible]

mote large projects with relatively little investment of their own. Under cover of the joint sector, they have gained entry into industries ordinarily deemed out of bounds for them and also got, on the strength of the association of the SIDCs with the projects, other concessions which they would not have got otherwise. And since the managing directors of the joint sector projects are always nominated by the private sector collaborators, control of these projects remains firmly in their hands.

In any case, the organisational resources of the SIDCs are too tenuous for them to make any major contribution to the joint sector projects sponsored by them. As Murthy points out, "In Andhra Pradesh which is handling 43 projects in the joint sector alone, apart from numerous projects in the private sector and a few in the public sector, the total technical staff strength is around 13 only, whereas in Karnataka which has assisted 107 projects and promoted 5 joint sector projects, the total technical staff strength is only 3". Clearly, professionalism does not grow under the banyan tree of IAS overlordship of the SIDCs.

Reminiscences of an Engineer by Kanwar Sain; Young Asia Publications, New Delhi/Stockholm, 1978, pp xii + 493, Rs 95.

IF ever proof were needed that a life full of great achievements need not necessarily be narrated in a manner becoming of those achievements, the present book would provide such proof. Kanwar Sain has been a very distinguished engineer-administrator, with a long and successful career behind him. A truly 'self-made' man even at the age of 80, and after many official retirements, he has refused to 'retire' and rest on his laurels; he continues to teach three hours a week at the IIT, Delhi. There is perhaps not a single major irrigation project undertaken in the country in the last fifty years or so with which Kanwar Sain has not been associated in a senior capacity and the book itself has interesting, though disjointed and rather gossipy accounts of his association with the Damodar, Bhakra, Hirakud, Kosi, Nagarjunasagar, Farakka and Narmada projects.

Such a life, spent in harnessing the powers of great river systems for human good, is obviously a most interesting life; but the narration is marred in many ways. One can overlook the bad writing, though in this case a good editor's services could have immensely improved the narration. But what is more sad is that such an undoubtedly gifted, resourceful and highly successful engineer, should have been given to such repeated recourse to flaunting testimonials to his ability, especially so when there are such living proofs to that ability in the movements which he has helped to build.

Our Crumbling Federal Finance System

Seventh Finance Commission's Award

Bhabatosh Datta

The Seventh Finance Commission's recommendations, while making all states richer in non-Plan resource than they had probably expected to be and despite the intention of securing 'progressiveness' according to needs, have in fact increased the inequalities among the states, as compared to the position under the Sixth Commission.

The reason for this, despite the acceptance of a more equitable formula for distributing the Central excise, is the much greater dependence on tax-shares than on grants.

There is a conflict here between two principles. From many standpoints, it is desirable to give the states as much as possible through the tax-shares, but as long as uniform rules are applied for allocating the tax receipts, large inequalities are likely. Grants on the other hand are fixed and they may be used as equalisers. There has to be a compromise between the two extremes.

This means that the Planning Commission will have to start where the Finance Commission has ended. If an equitable distribution is wanted as a final result, then, as a minimum condition, the Plan plus non-plan expenditure on the developmental services per person below the poverty line should be the same all over the country. This is yet far from being achieved and the Seventh Finance Commission has shifted the full responsibility to the Planning Commission.

THE first reactions to the recommendations of the Seventh Finance Commission have been much more favourable than normally expected. Every Indian thinks first in terms of his own state and the most prominent fact this time is that every state has received a substantial increase in the non-Plan transfer from the Centre over what it got under the last award. It may not be incorrect to say that the amounts received are in most cases larger than the amounts really expected. The fact that the awards fall considerably short of the demands from the states is not of much importance, for it is quite normal for such demands to be made as large as seemingly justifiable.

Apart from the size of the total transfers, there are other features in the new award which have made the state governments happy. The first is the fairly liberal provision for the upgradation of salaries and allowances of the state and local bodies' employees and of teachers. Questions will be raised about the logic of the principle of maintaining constant the relative difference between the Central government salaries and those adopted as the norms for the states at the 1972 level, but the broad fact stands that while all the states together wanted Rs 2,909 crores for this, the Commission has allowed as much as Rs 2,208 crores (Report, p 42). (All the figures, unless otherwise stated, are for the entire five-year period, 1979-80 to 1983-84.) Some states have been given on this account more than they had wanted. These include not only most of the new hill states, but also Andhra Pradesh, Bihar, Haryana, Karnataka and Rajasthan. The norms have been determined by taking the all-states averages of comparable salaries and there is in addition further provision for dearness allowances equivalent to the two Central instalments sanctioned after January 1, 1977. The relevant date for Kerala will however be January 1, 1978, as that state had been following the Centre in the matter of dearness allowances.

Debt Relief

The second important feature is the gain to the states from the debt relief measures. At the end of 1978-79, the total debts of the state governments are estimated to be Rs 18,785 crores, in which the liabilities to the Central government would be Rs 13,463 crores and the market loans Rs 2,572 crores. The residual amount comprises negotiated loans, compensation bonds, etc, provident funds and other unfunded debt. The Commission has estimated that Rs 943 crores out of the total debts to the Centre represent unproductive loans, in the sense that they are not expected to yield any financial returns. These include the loans used for public works, roads and bridges and also for education and social welfare. This no-return debt is to be written off. The states benefit unequally from this, because the loans of this category constitute ranging percentages of their total debts to the Centre. These percentages are naturally high for the new states. Among the other states, the percentages vary from zero in the case of a number of major states to 25 for Kerala and 45 for Assam (p 113).

The remainder, except the small savings loans, is to be consolidated into one loan and then divided into two parts. One part, classified as 'semi-productive', ie, not yielding adequate returns, is to be repaid in 30 equal annual instalments from 1979-80, and the other part, designated 'productive', is to be repaid in 15 annual instalments. The rates of interest on these consolidated debts will be 4.75 and 5.00 per cent respectively. All these together will mean a substantial relief to the state governments, both in interest payment and in annual repayments. Leaving out the hill states, one finds that the five-year relief on this account will vary from Rs 38 crores for Haryana to Rs 368 crores for Uttar Pradesh, the total for all states being Rs 2,156 crores.

The Commission also recommended that the states' shares in the small savings collections outstanding at the end of 1978-79 should be consolidated and then converted into 'loans in perpetuity'. This would mean that the

liability of the states to pay interest will continue, but the liability to repay the depositors will be borne entirely by the Centre. The idea is not as novel as one of the members has felt; the undated non-terminable government loans of the old days could in effect be loans in perpetuity. The Central government has not accepted this recommendation, though there is considerable strength in the argument of the Commission that the small savings loans are not given to the states for specific purposes and are therefore not classifiable and also that the state governments play a 'vital role' in mobilising the collections of small savings. The Central government has however agreed to grant a five-year moratorium on the repayment of these small savings loans for five years, thus leaving the Commission's operative estimates undisturbed.

Natural Calamities

The third important feature, welcomed by all states, is that relating to the financing of the expenditures on account of natural calamities. The Sixth Commission recommendation, which now operates, provided that the amounts granted by the Centre in excess of the amounts included in the non-plan revenue expenditure estimates should be regarded as advance Plan assistance, to be set off against future Plan disbursements. This was bad in principle, because it did not differentiate correctly between the consumption and investment elements in the so-called relief expenditure. To the extent such expenditure is protective, preventive or developmental, there is every reason to include it in the Plan outlay. But a very large part of the expenditure immediately following a calamity is not of this nature. If such expenditure is set off against future plan outlay, the whole plan structure is likely to be distorted. This is particularly true in the case of a calamity of such dimensions as the recent Andhra cyclone or the West Bengal floods. The Centre has tacitly recognised this by not insisting on the setting off of the amounts given to Andhra Pradesh against the plan assistance to that state and by assuring West Bengal that its plan will not be disturbed.

The Seventh Commission has very rightly distinguished between droughts which do not destroy productive assets and the other group comprising floods, cyclones and earthquakes which require large asset-reconstruction outlays. The expenditure estimates for the states include a normal provision for all types of natural calamities, varying in the case of the major states from Rs 1.47 crores per year for Haryana to Rs 13.60 crores for West Bengal and totalling Rs 100.55 crores for all the states. The procedure adopted for determining these amounts was the same as that followed earlier — taking the average of actual expenditure over a recent series of years — and it gave figures which were nearly double the amounts provided by the Sixth Commission. In the case of excess requirements for drought relief, the affected state government is to contribute not more than five per cent from its plan. This will be taken as an addition to the plan outlay and covered by advance assistance from the Centre. If the expenditure goes beyond this, the extra requirement is to be fully covered by the Centre — half as grants and half as loans. The Commission hopes that the "loan burden which a state would take on in such circumstances would act as a factor to discourage extravagance" (p 53).

In the case of excess expenditure on relief, repairs and restoration of public works following other types of natural calamities, the Commission has recommended non-plan grants from the Centre to cover 75 per cent of the requirements. Here also it is hoped that the 25 per cent burden on the state will be a check on wasteful expenditure. The Centre has been asked to go beyond these limits when there is a calamity of 'rare severity'. All this will be welcome to the states and particularly to those which are prone to droughts, cyclones and floods. The only point worth debating is why should the expenditure on account of relief for drought should be regarded as plan expenditure, unless it includes a large element of protective or preventive outlay.

Tax Devolution

All these recommendations provide substantial advantages to the states and, taken by themselves, they are fairly equitable, as the benefits will go in larger measures to the states needing them most. The most conspicuous element in the set of recommendations, is however, that regarding the division of the Union excise receipts between the states and the Centre. The share of the states has been raised to 40 per cent from the current level of 20 per cent, and this at one stroke has increased the divisible pool by nearly Rs 6,000 crores in the five-year period. Compared with this, the increase in the states' share in the income tax receipts from 80 per cent to 85 per cent is of very little significance. The other taxes, the receipts from which are also allocated among the states by the Commission, are not divisible in the sense in which income tax and the basic excises are. The receipts from the additional excises in lieu of the sales taxes on sugar, tobacco and textiles and the estate duty on property other than agricultural land have to be given back to states. The Finance Commission determines only the inter-state allocation. The returning to the states the receipts from the Union excise on electricity generation imposed by the last budget is only a belated recognition by the Central government of the impropriety of encroaching on the states' fields of fiscal operation.

The broad figures which have been widely publicised thus require to be put in their proper perspective. The total of transfers to the states under the new award will amount to Rs 23,063 crores, which is apparently about Rs 10,000 crores more than the transfers under the Sixth Commission awards. A substantial increase in the transfers would have taken place in any case, independently of any decision by the new Commission. There is also the fact that the right comparison is not between the estimated transfers under the new award and the actual transfers under the presently operating scheme, but between the former and what the transfers would be in the coming five-year period, if the Sixth Commission principles were continued unaltered. The total of transfers during 1974-79 as estimated by Sixth Commission was Rs 10,448 crores. It has actually turned out to be about Rs 11,200 crores. If the recent trends were maintained, the continuance of the Sixth Commission scheme would give the states a total of about Rs 16,150 crores. Against this, the Seventh Commission proposals (including debt relief) will transfer an estimated amount of Rs 23,062 crores. More than Rs 5,000 crores of the difference of Rs 7,000 crores is explained by the increase in the states' share in excise duties. The grants-in-aid under Article 275 have, for obvious reasons, come down from Rs 2,510 crores to Rs 1,173 crores. It may be noted here that the total of Rs 23,063 crores comprises Rs 4,791 crores as share in income tax, Rs 11,347 crores as share in central excises, Rs 1,867 crores from additional excise, Rs 81 crores from the railway fare tax compensation, Rs 64 crores from estate duty, Rs 1,146 crores from the new duty on power, Rs 1,173 crores of general grants, Rs 437 crores of upgradation grants and Rs 2,158

[illegible] increase in the total divisible pool. Their individual interest then lies in getting a large share out of the pool. This is dependent in the first instance on the estimates made by the Commission of their non-Plan revenue gaps. After these gaps have been estimated, the Finance Commission normally proceeds first to allocate the tax shares. Some states emerge with surpluses, which they would be expected to carry over to their Plan budget. Others, who will still have deficits, get grants-in-aid to fill the estimated gaps. The Seventh Commission estimates of the state governments' revenues and expenditures have in general been favourable to them, though there are wide differences between what they themselves indicated and what the Commission allowed.

States' Non-Plan Gaps

On the revenue side, the important element is the rates of growth assumed for the state tax and other receipts. The rates actually adopted for taxes are generally higher than those indicated by the states in their own estimates, but they are lower in all cases than the long-term growth rates during the 13-year period from 1963-64 to 1975-76 (Appendix I.1). A controversial question always arises in regard to the estimates of the yields from state investments. The Commission has assumed that the departmental commercial undertakings will break even by 1983-84. By that year, it is further assumed, the losses of the minor irrigation schemes would be reduced to half the level of 1979-80. The yield from multi-purpose major and medium irrigation has been assumed to be 1 per cent. The return from the power projects has been taken at 6 per cent per year, but this includes the electricity duties charged by the state and those payable to the Centre. One of the members has differed from the majority on this point, arguing that there is scope for improving the net earnings of the State Electricity Boards. Investments likely to be made after 1978-79 have not been taken into account.

In general, the percentage increases made by the Commission in the states estimates of their revenues have been smaller than the percentage reductions made on the re-assessment of expenditure. The Commission has found the states' revenue estimates more reliable than their expenditure estimates. There are individual items, like state emoluments, where the cuts have been small in most cases, and there have even been increases for some states. But the net [illegible] Plan revenue gaps [illegible] by the Commission are considerably less than those indicated by the states themselves. There is, of course, a natural tendency to under-estimate revenues and over-estimate expenditure, but it is not to be expected that the Commission's estimates of the gaps should in some cases be less than half or even one-third of the state estimates. In a few cases deficits have been re-assessed into surpluses.

Columns (2) and (3) in Table 1 show the surpluses or deficits as estimated by the Commission alongside the estimates made by the states themselves. The Table also shows the final picture after devolution and the statutory grants. It will be noted that the only state which itself showed a surplus is Haryana. On the other hand, Maharashtra's own estimate of a deficit of Rs 1,376 crores has been transformed into a surplus of Rs 1,291 crores on re-assessment, making a difference of Rs 2,667 crores. Other states, whose own estimates of deficits were similarly transformed into surpluses were Gujarat and Punjab. In the case of Karnataka a deficit of Rs 1,743 crores was converted into a small surplus of Rs 1.15 crores. In many cases the large gaps shown by the states resulted from the inclusion of expenditures not properly classifiable as non-Plan, but the fact remains that such wide divergences between the state estimates and the Commission assessments do not speak highly of careful budgeting, or of really intelligent bargaining strategy. Some states seem to be quite happy to have received from the Commission awards less than half of what they had wanted.

The final result shows that 21 states estimated a total deficit of Rs 34,338 crores while one showed a surplus of Rs 229 crores, making a net total deficit of Rs 34,109 crores. The Commission's re-assessment has resulted in a total deficit of Rs 9,040 crores for 17 states and total surpluses of Rs 2,216 crores for five states, making a net total gap of Rs 6,824 crores. The tax devolution recommended has converted some of the deficits into surpluses, and some into reduced deficits, while in the few cases indicated above the estimated surpluses were converted into larger surpluses. The extreme case is that of Maharashtra, whose re-assessed surplus of Rs 1,291 crores becomes a final surplus of Rs 3,005 crores. This is the usual situation resulting from the Finance Commission system, but the position has been glaring this time because of the large size of the devolution. And this brings one to the heart of the question of the [illegible] governing inter-state allocation of the divisible resources.

Central Resources

Before entering into that question, it is necessary to refer to a commendable innovation in the Report of the Seventh Commission.

The Central Government directed that in making the recommendations, the Commission should "have regard, among other considerations, to the resources of the Central government and the demands thereon on account of the expenditure on civil administration, defence and border security, debt servicing and other committed expenditure or liabilities". Such a clause was also included in the terms of reference of earlier Commissions. They considered the question and collected detailed information from and had full discussion with the Finance Ministry, but did not report on the subject. The Seventh Commission has for the first time after the first two commissions, devoted a full chapter of the Report on this. Details of the Central government's own forecast of its revenues and expenditure in the next five years have not however been given and it is difficult therefore to evaluate the depth of the Commission's exercise. It is stated that it has "taken somewhat higher rates of growth of revenues than assumed by the Central government, in respect of Union excise duties (7 p c), customs duties (7 p c) as well as the corporation tax (9 p c)". The return from equity investment by the Central government is expected to rise from 4.4 p c in 1976-77 to 7.5 p c in 1983-84. On the expenditure side, the projected expenditures on Police and on Audit have been "moderated". Export subsidies are accepted as estimated, but it has been assumed that by 1983-84, the subsidy on fertilisers would be progressively eliminated and the subsidy on foodgrains would be reduced by 25 per cent (chapter 3).

This re-assessment of the Central government forecast has meant an increase of Rs 4,626 crores during 1979-84 over the original estimate. Raj Krishna in his Note of Dissent (to which further reference will be made later) has reached a higher figure of improvement, on the basis of an 8.1 per cent annual growth in the central excise revenues. This figure is based on three facts: first, the long-term rate of growth of the excise revenues during 1960-1976 has been 8.23 per cent: secondly, the recent growth rate during 1973-74 to [illegible] has been 8.9 per cent; and thirdly, the long-period elasticity of excise revenues with respect to manufacturing income

Table 1: Non-Plan Surpluses and Deficits (*Rs crores*)

States (1)	Surplus or Deficit as Estimated by State Governments (2)	Surplus or Deficit as Re-assessed by Commission (3)	Total Devolution (4)	Surplus or Deficit after Devolution (5)	Art 275 Statutory Grants (6)
(1) Andhra Pradesh	— 2,652	— 580	1,503	+ 923	—

Source: Seventh Finance Commission Report, 1978 (FINCOM-VII), pp. 88-89 and Appendix I.28 (There are small discrepancies in the figures compiled from different tables.) The figures for Total Devolution exclude Rs 64 crores of Estate duty, the Statewise allocation of which cannot be completed now.

has been 0.744, which, applied to an assumed 10.9 p c annual growth of such income, gives an 8.1 p c growth in excise receipts. The third element has obvious loopholes, but the broader argument based on the trends of growth is easier to accept. This, along with certain other assumptions, makes Raj Krishna's estimate of the five-year improvement in the Central revenues nearly Rs 6,000 crores. On the whole, one feels that both the exercises are inadequate. This is unsatisfactory, because the inter-state disparities to be generated by the Finance Commission awards will have to be made good at least partially by the Central government through special non-Plan assistance, in addition to the Plan allocations. There is no reason why the Central estimates should not be re-assessed as meticulously as the state estimates and the exact extent of the re-assessment clearly shown.

Inter-State Allocation

The inter-state distribution of the divisible pool recommended by the Seventh Commission strikes new lines. It is particularly necessary to examine how far the new principles will reduce inequalities and will satisfy disparate demands. In regard to income tax, the Seventh Commission continues the existing formula of distribution with a 90 p c weightage on population and 10 p c on collection. The changes made in the case of the minor sources are also not of much importance. The grant in lieu of the tax on railway passenger fares will now be based on the sale of non-suburban tickets in the respective states, instead of on route mileage. The net proceeds of Estates duty (excluding the share of the Union territories) will be distributed "in proportion to the gross value of the immovable property and property other than immovable property taken together located in each state and brought into assessment" (p 121). Any property located outside India will be taken as located in the state in which it is brought into assessment. This is a change from the Sixth Commission formula which distributed the proceeds from movable property according to population. The grant on account of the wealth tax on agricultural property will be equivalent to net collection within each state and not proportional to the agricultural property located and assessed in the state.

The quantitative effect of all these changes will be small. The really important changes concern the central excises and the additional excises in lieu of sales tax. It has to be noted that the outset that while previous Commissions have found that the number of sharing states has been increasing, the Seventh Commission has to cover the very special case of Sikkim. Under the Constitution, both income tax and union excise receipts are to be distributed among the states within which the tax and the duties are leviable. Sikkim does not yet qualify for shares in these. The Commission has therefore given in each relevant case two alternative schedules of percentage shares, one without Sikkim and the other including that state (to be operative when the taxes are extended to it). The difference between the two schedules is however very small (involving only the third decimal place) and in what follows the lists including Sikkim have been taken into account.

Additional Excises

The basic problem is that of achieving some measure of equity among the states which are relatively very strong in their financial position and those that are particularly weak. For any meaningful comparison the "hill states" have to be left out, because their shares would normally appear to be very large compared to such variables as population, but are not very significant in absolute magnitude. All of them together get Rs 420 crores (2.1 p c) out of a total tax devolution of Rs 19,300 crores. Himachal Pradesh and Jammu and Kashmir together get Rs 269 crores and the remaining five only Rs 151 crores. They however get Rs 1,046 crores out of the total grants of Rs 1,173 crores. Taking the additional excise duties in lieu of sales tax first, one notes that the main idea behind all proposals is to distribute the amounts in proportion to consumption. As the necessary data for this are not available, surrogates have to be sought. The Sixth Commission distributed these receipts on the basis of three factors — population, state domestic product at current prices and state output of the relevant commodities, giving them weights of 0.7, 0.2 and 0.1 respectively. The Seventh Commission has set two principles — for sugar on the basis of the average despatches to the states during the recent past, and for tobacco and textiles on the basis of the product of the population and per capita State Domestic Product. The assumption in the case of sugar is that consumption in a state is proportional to the supplies received and in the case of the other group that consumption is proportional to the State Domestic Product.

The first assumption is vitiated when there are movements across the states

[illegible] Additional Excise Duties in lieu of Sales Tax

(Percentages)

(1)	(2) Sugar	Seventh Commission (3) Textiles and Tobacco	(4) Weighted Average	Sixth Commission (5)

and the second does not take into account the pattern of distribution of income. This however is not a serious criticism, because any set of criteria will be open to some objection or other. What is really striking is that, despite the over-riding desire to secure more equality in the final picture, the Seventh Commission formula allots relatively more to states like Maharashtra and Punjab and less to states like Bihar or UP, as compared with the Sixth Commission allocation. It will of course be argued that if the sales taxes were continued, the richer states would have earned large amounts, but there is no assurance that the formulae used by the Seventh Commission are better determinants of state consumption than those used earlier. If the ultimate objective of the distribution of tax shares is to reduce disparities, the problem is being accentuated by the inequality resulting from the allocation of the receipts from the additional excises.

A comparison with the Sixth Commission formula will show that for most of the states, the percentage shares have not changed much. The benefits and losses from the new 'consumption-criteria' appear to have been concentrated among a few states only. For making the comparison meaningful, the two schedules given by the Seventh Commission have been combined into a single schedule of weighted averages, assuming that the receipts from the duties on tobacco and textile will continue to be four times the receipts from sugar. Table 2 shows the comparative position under the awards of the two Commissions.

Basic Excises

The positive, but unsuccessful effort of the Seventh Commission in attaining equity is represented by the change in the formula for distributing the basic central excise receipts. The earlier Commissions had all given large weightage to population, with 20 to 25 per cent weight on some indicator of backwardness. The Sixth Commission awarded 75 per cent of the divisible amount to each state on population and the remaining 25 per cent on the product of the population of the state and the distance between the per capita income in the state and the highest per capita income among all the states (i e, the per capita income in Punjab). The Seventh Commission considers this as inadequately progressive and gives its own formula which gives an equal 25 per cent weightage to each of four factors: population, the inverse of the per capita state domestic product; a specially calculated poverty ratio; and a revenue-equalisation factor. The first two of these do not raise any question, apart from the general fact that the per capita state domestic product is not a precise indicator of the per capita income in the state, when it has extensive trade and payments relations with other states. It is the other two, and particularly the poverty ratio, which deserve examination.

Revenue Equalisation

The principle behind the revenue equalisation formula adopted by the Commission is that "states which are less favourably placed in regard to their resource potential should be specially helped in order to place them in a position where they also can take steps more readily for the betterment of the people" (p 87). The method adopted is simple. Leaving out the 'atypical' states of Manipur, Meghalaya, Nagaland, Sikkim and Tripura, the average of the per capita tax and non-tax revenue of each state for 1975-76 and 1976-77 has been regressed on the average per capita income for 1973-1976. The per capita revenue potential of each state has then been derived from the distance between the result of this and the highest estimated per capita revenue among all states — Punjab again — multiplied by the population of the state. As 1977-78 and 1978-79 have not been taken into account, no state is rewarded for failure to increase resources recently, nor penalised for having raised larger revenues. The method is less sophisticated than the alternatives one could suggest, but is less complex also. The important point here is that a 25 per cent weightage on this factor means that in a scheme in which there is a built-in tendency to increase inter-state disparities, this factor will involve a total amount of only about Rs 500 crores per year.

Poverty Ratios

The poverty ratios used by the Commission have been worked out by Raj Krishna (Appendix IV 9). The cut-off levels chosen are the Dandekar-Rath figures of Rs 15 and Rs 22.50 at 1960-61 prices per capita per month for rural and urban areas respectively, in preference to the Planning Commission figures of Rs 18 90 and Rs 25.00. State specific poverty lines have then been calculated for 15 states by using Pranab Bardhan's state indices of rural consumer prices in 1960-61, which were based on the study made by G S Chatterjee and N Bhattacharya. For the urban areas, the three-year average of the working class consumer price index is used The results have then been adjusted to 1970-71 prices by using the consumer price index for agricultural labour and that for the urban working class

These then have been further adjusted upward by adding the per capita monthly public expenditure by each state government on health and family

Table 3: The Divergence Index

State	Shares in Total Transfers (per cent)		Shares in Total Population	Divergence Index	
	Majority	Raj Krishna		Majority	Raj Krishna
(1)	(2)	(3)	(4)	(5)	(6)
(1) Andhra Pradesh	7.31	6.48	8.03	91.03	80.70
(2) Assam	2.49	2.54	2.70	92.22	94.07
(3) Bihar	10.62	14.38	10.41	102.02	138.14
(4) Gujarat	4.62	3.47	4.93	93.71	70.39
(5) Haryana	1.48	0.96	1.85	80.00	51.89
(6) Karnataka	4.82	4.14	5.41	89.09	76.52
(7) Kerala	3.70	3.86	3.94	93.91	97.97
(8) Madhya Pradesh	7.66	8.40	7.69	99.61	109.23
(9) Maharashtra	8.23	5.90	9.31	88.40	63.37
(10) Orissa	4.72	5.36	4.05	116.54	132.35
(11) Pujnab	2.01	1.14	2.50	80.40	45.60

planning, water supply and sanitation, education, administration of police, jails and courts, roads and social welfare. The "poverty ratio", or the cumulative percentage of the persons below these "augmented poverty lines" have been found by linear interpolation in the relevant expenditure bracket. The number of persons below the line in each state is derived by applying the percentage to the 1971 population. The final "poverty percentage" for a state is the percentage of such persons in that state to the 15-state population of such persons. To take an example, Bihar has a "poverty percentage" of 13.03 and has 10.35 per cent of the total population of these 15 states. *Its share in* the number of poor persons is thus substantially larger than its share in the total population. The states in which the poverty percentage is higher than the share in the total population are *Bihar, Kerala, Orissa, Madhya Pradesh,* Tamil Nadu *and* West Bengal. *For six* of the states other than the 15 covered by the exercise — Himachal Pradesh, Jammu and Kashmir, Manipur, Meghalaya, Nagaland *and* Sikkim — the poverty ratios have been assumed *to be the same* as for Assam, while the West Bengal ratio has been taken for Tripura. *Probably* the Assam ratio would have been appropriate for Tripura also.

There are some interesting features in the results of the exercise. *Broadly,* some of the states generally considered relatively rich *show* high poverty percentages. These include Tamil Nadu and West Bengal. On the other hand, the share of Uttar Pradesh in the total number of poor persons is less than its share in the total population. *From a* comparison of the "poverty ratios" within the states, *it appears that these (for rural and urban together) are as* high 64.06 for Bihar, 62.25 for Kerala, 67.50 for Orissa, 60.71 for Tamil Nadu and 62.28 for West Bengal. In some cases, the differences between the rural and urban ratios are quite large. In West Bengal, for example, the percentage of people below the augmented poverty line is 70.82 in rural areas and 36.30 in urban *areas. In Gujarat,* Karnataka, Kerala and Tamil Nadu, *the two* ratios are close to each other, while in Andhra Pradesh, Haryana, Punjab, Rajasthan and Uttar Pradesh, it is the urban poverty ratio which is much higher than the rural ratio.

These figures indicate that if a simple 'poor'-'non-poor' dichotomy is taken, the distribution of real consumption can be very inequitous in states with high over-all *per capita incomes.* The rural-urban differences indicate *that this two-sector distribution pattern* is more equitable in agriculturally developed states and those with an extensive development of *small industry* than *in states* high in the scale of *industrialisation. And a low level of* industrial growth may make the rural-urban *differences small.* The other fact that is brought into light is that the *per* capita benefit from government expenditure is small — *around Rs 4.50* per month. The figure would have been *smaller, if* the expenditure on police, jails and courts were omitted. It could have been noted also that in education and health services there is a disportionately large government expenditure in the metropolitan and other urban areas. The *'augmentation'* for the rural areas is very small.

Raj [illegible]

While Raj Krishna is the author of the poverty percentage criterion used by the Commission, the additive 25 per cent weightage on four factors has been criticised by him in his dissenting note *on the ground* that it is not sufficiently progressive. He is also against giving any weightage to *collection* or contribution and therefore recommends a common formula *for* both income tax *and the basic central excises.* He recommends the distribution of the divisible pool of these taxes on the basis of what he calls the "income-adjusted poverty population" of each state. This is derived by multiplying the population of the state by the poverty ratio (i e by taking the total number of persons below the augmented poverty line) and then dividing it by the per capita income. The revenue-distance, the fourth variable used by the majority, is considered important, but it is brought in only when determining the amounts of grants.

Raj Krishna's formula clearly gives a more equitable distribution than the formula used by the *majority.* The states which would gain substantially in terms of the percentage shares are *Assam, Bihar, Madhya Pradesh, Orissa* and Uttar Pradesh, while the shares of Andhra Pradesh, Gujarat, Haryana, Kerala, Maharashtra and Punjab are reduced. In the other cases the changes *in the shares are small,* but as Raj Krishna's *scheme* involves a larger total devolution of funds, the amounts payable *to these states are* somewhat larger.

Before making a fuller comparison of the results of all this, it is necessary to *note the meaning* of the *Raj Krishna* formula. If the population of a state is *n, the number* of persons below the poverty line is p and the state domestic product is y, then the 'poverty ratio' $r = p/n$ and the "income-adjusted poverty population",

$$\text{IAPP} = \frac{nr}{y/n},$$

which can be put as $\frac{n^2 \cdot r}{y}$ or $\frac{n \cdot p}{y}$.

The '*poverty percentage*' of any state is its own IAPP as a percentage of the *total IAPP* of all states. The share of a state will thus vary directly with either population or poverty ratio and inversely *with its per capita income. It* also follows that if two states have the same total state domestic product and the *same number* of poor persons, their shares will differ according to the their *total* populations. If, however, two states have the same total state domestic product and the *same poverty ratio,* their shares will diff...

[illegible] population. The first of these principles seems fair, but the second case would raise questions. *In fact*, one can ask whether the poverty ratio and the state domestic product are variables independent of the total population and whether the Raj Krishna formula, while more progressive than the majority schemes and also than the schemes of the earlier commissions, retains more emphasis on population than is apparent on the surface. This applies also to the majority formula.

Weightage on Population

The etxent of the effective weightage on poulation can be seen if the shares of the states in the total transfer (devolution plus grants) are compared with their shares in the relevant total population. This can be done by converting all figures to a per capita basis and also, more clearly perhaps, by bringing out in the form of an index the divergence between the shares in the transferred funds and the shares in the population. This index can be calculated by dividing the share of a state in the transfer by its share in the population and then multiplying the quotient by 100. If a state has 5 per cent of the total population and gets 5 per cent of the total of transfers, its divergence index will stand at 100. Table 3 shows the divergence index for each of the 15 major states — both under the majority formula and the Raj Krishna scheme. The hill states are left out because their high index numbers will be unrepresentative. Besides, the two exercises give nearly the same results for these new states.

It will appear from the Table that the divergence ratio is between 90 and 110, ie, within a range of 10 p c either way from 100, for 10 states in the majority scheme and for 5 states in the Raj Krishna scheme. If the range is extended to 20 p c either way, five more states (i e, all the 15 states) come in under the majority scheme while two more are added in the Raj Krishna list. The highest index in the majority scheme is 116.54 for Orissa and the lowest 80.00 for Haryana. The highest in the Raj Krishna scheme is 186.14 for Bihar (Orissa's index is 132.35) and the lowest 45.60 for Punjab. The majority scheme thus retains a substantial weightage on population, directly and indirectly, despite the complex formula. Population remains an important element in the Raj Krishna formula also, almost as important as in the sixth commission scheme.

Per Capita Surpluses

It is necessary to emphasise the difficulty in devising an [illegible] fair formula, which is [illegible] applicable to all states and which can avoid substantial surpluses for some states and deficits (balanced by grants) for others. It will be a challenge to anyone to build up a uniform scheme that, in the present circumstances can avoid a large surplus for Maharashtra and a grant-fed gap for Orissa. The difference between a surplus generated by the Finance Commission award and a zero balance resulting from a grant filling up a gap, is finally a matter of the plan resources available to a state. The differences between the final surpluses of the different states and of the per capita amounts are smaller under the Raj Krishna scheme than under the majority plan. Again leaving out the hill states, the minimum surplus per capita is Rs 15 for Orissa under the majority allocation and the maximum Rs 676 for Haryana (Punjab Rs 597 and Maharashtra Rs 596 near the top of the scale and Rajasthan 85 and Assam 74 near the bottom). Under the Raj Krishna formula every state gets a minimum per capita surplus of Rs 100 and the maximum is Rs 577 for Haryana (p 147). The ratio between the lowest and the highest per capita surpluses is 1 to 45.1 in the majority scheme, while it is only 1 to 5.8 in the alternative plan. Raj Krishna's argument is strengthened by the fact that the standard deviation in the majority-report per capita surpluses around the 15-state average of 278 is 206, while Raj Krishna's scheme shows a standard deviation of 150 around the average of 281.

The reasons given by the majority for not accepting the Raj Krishna formula are not very convincing. There can of course be a constitutional issue as to whether collection can be entirely ignored in the case of distributing the income tax receipts, but that difficulty does not arise in the case of the excises. The majority argument that inter-state differences in poverty are due largely to the differences in the attention given to agriculture cannot be carried very far. And one can ask why then a particular weightage of 25 p c is chosen for the poverty percentage in the majority scheme. It is not also correct to say that higher income states have a lower poverty ratio. There are complex points of interdependence among the variables in both the schemes, but Raj Krishna's formula has the merit of being simpler and more equitable

Recommendations Rejected

The Government of India has followed *the established convention* by accepting the [illegible] majority recommendations. This convention [illegible] not however been honoured in the case of majority recommendation for compensating the states additionally for the full loss resulting from the introduction of prohibition. The Government of India has not even accepted the modified suggestion made by Raj Krishna and H N Ray and has stuck to its decision of fifty per cent compensation. Apart from the assertion that the Government of India "consider it appropriate" that the losses should be shared jointly, the only positive argument is that the successful implementation of a prohibition programme may enable the states to increase their other revenues. It has not been considered that the enforcement of prohibition may increase certain types of administrative expenditure.

The other recommendation that has not been accepted by the government was unanimous. This relates to the small savings loans referred to earlier. The Government of India set an undesirable precedent in 1962 when it rejected a Commission recommendation on the ground that it was not unanimous — thus giving any individual member an effective veto right. The present case of rejecting a unanimous recommendation sets up a precedent which may have more extensive implications in future.

Conflict of Principles

When everything is said and done, it is disconcerting to discover that the Seventh Commission recommendations, while making all states richer in non-plan resources than they had probably expected and despite the intention of securing 'progressiveness' according to needs, have in fact *increased* the inequalities among the states, as compared to the position under the Sixth Commission. The per capita transfers under the Sixth Commission awards were within a smaller range of variation and were higher for states like Orissa, Bihar or Uttar Pradesh than for Maharashtra, Punjab or Haryana. The reason for this, despite the acceptance of a more equitable formula for distributing the central excise, is the much greater dependence on tax-shares than on grants. The Sixth Commission scheme gave 70.12 p c of the total transfer through tax-sharing and 29.88 p c through grants, while the Seventh Commission has given 92.3 p c through tax-devolution and only 7.7 p c through grants. The Raj Krishna formula would have made the proportion of tax-shares 91 per cent. *The grants* under the Sixth Commission

[illegible] came to Rs 2510 crores for 14 states and these were in addition the special upgradation grants for improving administration and social services amounting to Rs 838 crores. The Seventh Commission's gap-filling grants for 8 states come to Rs 1,173 crores and the upgradation grants are also much less at Rs 437 crores. The 8 states getting the statutory grants comprise Orissa and the seven "hill states".

There is here a conflict between two principles. From many standpoints it is desirable to give the states as much as possible through tax-shares. They then come to have an interest in developing the tax-base of the economy and they share in the buoyancy of the revenues. But as long as uniform rules are applied for allocating the tax-receipts, large inequalities are likely. Grants on the other hand are fixed and they may be used as equalisers. The simplest way to make the per capita transfers very nearly equal would be to reduce the proportion of tax-sharing, so that most of the states end up with a deficit. The grants (including special grants) may then the so determined as to make the per capita total transfers nearly equal. There has to be a compromise between two extremes, but if the trends in future continue in the direction set by the Seventh Commission, future Commissions in their munificence may accentuate the problem of disparities in non-Plan surplus.

Planners' Task

This means that the Planning Commission will have to start where the Finance Commission has ended. It is necessary in the first instance to note that the large transfers by the Finance Commission need not mean that the total of transfers from the Centre to the states (non-Plan, Plan and special) would be larger than they have been. According to the expected code of behaviour, the *states gaining surpluses* from the Finance Commission awards should carry these amounts to their Plan budgets and the Planning Commission will decide on its assistance accordingly. There is however no machinery for ensuring that the expected [illegible] surpluses do materialise in [illegible]-to-year operations. And past [illegible] has often been that the [illegible] with the strongest position in [illegible] Plan finances have obtained [illegible] large assistance from the [illegible] Commission. The Gadgil [illegible] inadequate now [illegible] Commission will have [illegible] If an equitable [illegible] the final result, then, as a [illegible] condition, the Plan plus non-Plan expenditure on the developmental services per person below the poverty line should be the same all over the country. This is yet far from being achieved and the Finance Commission has shifted the full responsibility to the Planning Commission.

This is not entirely the fault of the Finance Commission. Under the Constitution, it cannot go beyond certain constraints. More constraints have been imposed by conventions and sometimes by special executive decisions. The operation of the dual system of transfer has now assumed dimensions very much larger than was conceived when the line was drawn between Plan and non-Plan expenditure and conventions established for *their financing. It is time now that* the whole problem was re-examined, with a view to establishing a continuously operating and fully integrated machinery that has [illegible] all finances, that eliminates the need for harmful strategies used both by the Central and by the states in the game of federal finance — bypassing the Finance Commission awards through central surcharges, or engineering large non-Plan gaps in the state budgets — and ultimately reduces not only the disparities among states, but the much more serious disparities between income-groups. Keeping the state governments happy is not necessarily the same thing as increasing the welfare of the people. And the state governments may find later that their total position from year to year is very much different from what it appears to be now. It may be found within a few years that the Seventh Finance Commission, through its honest efforts to help the states, had only served to bring the inherent defects of our federal finance system into glaring light.

Towards a Functional Land Redistribution Programme

R K Rath

Land legislations cannot change agrarian relations according to their professed intentions without the necessary social and material backing. Land ceiling legislation, for instance, presupposes not only successful unearthing of the surplus land and its redistribution but also the creation of conditions of production such that the new allottees can earn a better livelihood from the land. Both these are onerous but necessary tasks in any attempt to create a viable class of small peasant proprietors.

ANYONE with some experience of land tenures and administration of agrarian legislations knows that there is always more than meets the eye. Land legislations have never succeeded in unearthing problems they were meant to solve; they have merely succeeded, in varying degrees, in solving problems that came to the surface. Land laws, moreover, sometimes have the effect of accentuating the very problems they were meant to solve. As Daniel Thorner observes, efforts to change agrarian relationships by law "have almost always fallen far short of their goals or had effects other than those intended".[1] The Permanent Settlement Regulation never intended the exploitation of the raiyat in the areas in which it was in force. The Raiyatwari system which, according to Munro, meant that "every ryot will on his own estate be proprietor, farmer and labourer" had led, before long, to extensive sub-letting; indeed, the Famine Commission of 1880 had to take note of "a considerable class of subordinate tenants... who have no permanent interest in the land, and who pay such high rents that they must always be in a state of poverty."

It does not follow from this that land laws serve no purpose. They formalise the relationship between the government and the landowner, and among such interests in land as can be ascertained. These are important functions. So far as agrarian reforms are concerned, they provide legal sanction for effecting the intended reforms. In order that these reforms are effectively implemented and that problems meant to be solved do not go underground, legislations have to be supported by suitable executive measures. In the absence of such measures, distortions set in, and the reforms programme is before long frustrated beyond redemption.

In the taking over and distribution of land in excess of the statutorily determined ceilings in different states, the cleavage between the administration of the provisions of the laws and the purpose underlying these laws has been patent for some time now. If the cleavage has not been sufficiently recognised, it is because the purpose has been made synonymous with the administration of the law — and thus has been made to lose its identity. The land redistribution programme is basically a programme of creating gainful employment in the rural sector. It can be argued that it does not go far enough and that the allotment to the landless of small parcels of land, usually of low fertility, does not provide them with sufficient income. The critics of the programme however, have been unable to suggest a more viable alternative. The programme, admittedly, does not go as far as one would like it to go, but it does provide a solution, however partial, and hence has considerable merit in a situation of staggering rural unemployment. Of the total, economically active, population of 180.4 million in 1971, 130 million or 72 per cent were in agriculture. What is more, 18.4 million out of the 50.4 million (36.5 per cent) in non-agricultural employment were in rural areas. The prospect, of absorption of a significant section of the rural labour force in non-agricultural employment, is negligible. Non-agricultural employment has not been growing fast enough to absorb the surplus rural labour. There is, as a matter of fact, substantial unemployment in this sector.

The argument that mere transfer of ownership does not generate additional employment or bring about production increases is valid only if there is a *status quo* in the conditions of production; if, on the contrary, these conditions are upgraded, more intensive farming resulting in larger employment should be possible. What is more important, the gains in employment and production would be more equitably distributed. Radha Sinha lists[2] the following further disadvantages of large wage farms in societies with surplus rural labour :

(i) Richer farmers would monopolise the limited supporting services.

(ii) There would be neither any job security nor any guarantee of fair wages.

(iii) There would be a high risk of unemployment during droughts.

There are two major shortcomings in our land redistribution programme. First, the pace of taking possession of surplus land and distributing it among the landless has not been satisfactory. Of the nearly 40.5 lakh acres declared surplus by the end of July 1977, only about 21 lakh acres have been taken possession of. Further, only about 13 lakh acres have been distributed. In other words, a mere 32 per cent of the area declared surplus has been distributed; the remainder of the allottable area still remains with the former landowners. This achievement would have to be discounted further considering that, quite a few cases of reported allotment are said to exist only on paper, the allottees having not been put in physical possession of the land.

Secondly, the land redistribution programme has not been accompanied by effective measures to upgrade the *conditions of production* and correct the low productivity of the land allotted. Conferment of proprietary status on allottees may be an ideological gain, but the programme is relevant as an instrument of economic well-being and must be reckoned as a failure if it does not realise the economic gains built into its design.

The first shortcoming can be corrected by legislative-administrative measures, and the will to accelerate the pace of the programme should yield tangible results. As for the second, a closer review of our policy of creating peasant proprietorships seems to be necessary.

Inability of the new class of peasant proprietors to retain possession of their estates has been the experience of

[illegible] other countries besides India. This seems to have been due to

- (a) the incapacity of the land to provide the allottee with an income higher than what he used to earn through wage employment, and
- (b) the absence of any means of subsistence for the allottee and his family till they can harvest the produce.

Both factors have the effect of preventing the allottees from taking to productive agriculture. Their ability to cultivate the land productively does not increase significantly with the passage of time, since their income does not yield a surplus sufficient to raise the productivity of the soil and meet their consumption expenses till the harvest. Proprietorship, under these conditions, has very little meaning.

A policy of public investment in ceiling-surplus lands prior to their formal assignment to the landless is obviously necessary. This investment will be on permanent improvements such as land development and irrigation, as well as on seasonal operations such as application of fertilisers and pesticides and use of improved seeds. Public management of the lands, during the first three years of vesting in the state, in accordance with a well-conceived project and investments both on permanent and seasonal measures during this period should be preferred to a policy of straightaway conferring proprietorship on the allottees who have no access to resources and who will continue to rely on wage employment in preference to cultivating their own farms. A local body, assisted by an agricultural officer, can be entrusted with management and should be assisted with grants for meeting investment and operational expenses subject to the limits set forth in the project developed for each local area.

[illegible] public ownership of land is [illegible] envisaged, ultimate transfer of ownership to the eligible categories may be recognised; it may further be recognised that public management will be a purely temporary measure, designed to overcome the drawbacks experienced by the small peasant-proprietor. [illegible] of allottees may be finalised before the commencement of public management, but the prospective allottee [illegible] forfeit his right to assignment [illegible] of his failure to work for [illegible] number of days on the [illegible] employment on the farm [illegible] on a wage basis, and the [illegible] after meeting operational expenses should be commuted to cash during the period of public management. This amount may, at the conclusion of public management, be apportioned among the allottees so that they may not turn to wage employment in preference to cultivation of their own farms. The allottees would have been initiated to a better standard of crop husbandry during this period and will, if credit is available, not relapse into indifferent husbandry. It will be necessary to enrol them as members of primary co-operatives soon after formal transfer of ownership to them and to ensure that they are not denied credit.

Public management has been suggested because of the need to make public investments in the land and to provide continued wage employment to the allottees until the land begins to sustain them. An advantage of public management would be the adoption of a project approach. This would be particularly useful where the surplus land is of poor fertility — this is usually the case — and substantial upgradation measures are necessary. It may be necessary to put the land under grass instead of food crops and relate land use to a livestock-rearing occupation.

If public management is not accepted either because the available surplus land is not in compact blocks or because of other considerations, the main ingredients of the public management system can still be incorporated into a peasant proprietorship system with some modifications. These ingredients are (i) public investment in the land, and (ii) provision of the means of subsistence to the allottee until the land begins to yield a reasonable return. Even if the land is privately managed from the beginning, supervised investment out of public funds should be possible. This investment (including investment in seasonal operations) can be administered and supervised by a public employee. In order to guard against misutilisation, the allottee may, for about three years, be given annual cultivating rights; the conferment of full proprietorship should depend on the record of his diligence. During the period prior to acquisition of full proprietorship, he may be paid living wages.

The objection to either of the above systems of land management can be two-fold. The first is that the investment should appropriately be treated as a credit to the allottee and should be recovered from him on easy terms. There would otherwise be a heavy strain on public exchequer. The second objection is related to the first and consists in the fact that the cost would be prohibitively high.

It has been suggested earlier that the entire approach towards the land redistribution programme should be inspired by the goal to create additional employment. The expenditure in connection with investment in the surplus land and wage payments to the prospective allottees should be considered as expenditure on creation of additional jobs. Viewed thus, the expenditure suggested above cannot be considered unduly high.[3] To try to recover this amount from the allottee would mean a diminution of his real income during the critical period, when whether or not he will be self-employed on his estate will be decided. Prospects of self-employment will diminish if his net earning is low. A small fall in the net earning will make all the difference because the total earning from his petty estate will be small.

Expenditure on increasing productivity of small farmers is already being incurred and expenditure as suggested above will not really be a substantiative departure from present policy. The only distinction of this approach would be that the land redistribution programme will come to subserve the objective of employment generation instead of being little more than a statistical account of implementation of land ceiling legislations.

MISLEADING INDEX OF PERFORMANCE

Recently a customer complained to a newspaper columnist about the working of a bank. The columnist commented: "In India millions of satisfied customers never write a letter of appreciation, while the few who have reason to be disgruntled can create an uproar—a misleading index of performance in the ultimate analysis." (Economic Times, November 26, 1978).

These words could well have been written about the Life Insurance Corporation. LIC settles an average 2,000 claims every working day. A very good record. But from the complaints aired in the press, you would think otherwise!

Let's look at the total picture: Last year LIC settled 6.05 lakh claims (value: Rs. 200.26 crores). At the end of March, 1978, only 82,872 claims remained outstanding (value: Rs. 31.26 crores). The ratio of outstanding claims to claims intimated during the year was 13.21 per cent by number, and 15.10 per cent by amount.

Is that good or bad? One way to judge is to look at the ratios achieved by private insurers, before nationalisation. (Some people think the private sector is more efficient than the public sector). The 1954 figures of seven top insurance companies were:

Company	Percentage of outstanding claims to claims intimated (by amount)
Oriental	36.48
Bombay Mutual	42.47
Bombay Life	49.87
Empire of India	53.27
Hindustan Co-op.	54.31
New India	59.41
National	74.70

([illegible] *Indian Insurance Year Book*)

[illegible] claim amounts have [illegible]. Yet LIC has [illegible] down the ratio [illegible] to 15.10 per [illegible]

[illegible]panies doing [illegible]tates? Here [illegible] for 1976.

Company	Ratio of unsettled claims
Prudential	20.10
Equitable	18.01
Metropolitan	16.01

So LIC is not doing too badly. Especially when you consider that the statistics are loaded against LIC. Over 20 per cent of the total year's business is completed in March, the closing month of the financial year. Hence the maturity claims will also be the highest in March. Allow a month to complete the formalities of settling a claim. You will then see that the claims arising in March alone can tilt the ratio against LIC.

But never mind, LIC's top brass themselves admit that the ratio needs to be improved. They now regularly examine why claims remain unpaid. The analysis of claims outstanding on March 31, 1978, showed the following:

Causes	No. of claims
At the LIC operating office	
1. Maturity intimation/ claim forms not issued	7569
2. Further requirements to be intimated	534
3. Payment pending	480
4. Claim investigation incomplete	1748
5. Requirements for admission of claim met but discharge forms not issued	147
Group total	10478
On the policy-holder's side	
6. Age proof to be given to LIC	551
7. Claim forms/discharge forms/policy documents to be sent to LIC	61,378
8. Required information not sent to LIC	3,315
9. Proof of title not produced	2,698
Group total	67,942
Miscellaneous	
Policy-holders/claimants not traceable	2270
Claims pending for other requirements (exchange permit, etc.)	455
Claims under [illegible] (educational [illegible], etc.)	[illegible]
Replies awaited from doctors, etc. (death claims)	[illegible]
Group total	[illegible]
GRAND TOTAL	[illegible]

Thus, 82 per cent of the outstanding claims remained outstanding because the policy-holder/claimant had yet to meet a necessary requirement. Thirteen per cent could be blamed on LIC. The Corporation has taken several steps to improve matters.

1. Formalities are being relaxed in apparently bona fide cases. The requirement of proof of age is being dispensed with for policies of small amounts; small claims are being paid by money order to eliminate the need for an advance receipt; legal evidence of title is being waived if there is no dispute among heirs; attestation formalities have been made easier.

2. A cell has been created within the Corporation to speed up claim settlements. Causes of delay are regularly analysed and rectified where possible. Officials are sent after claimants who do not respond, to help them complete the formalities. (Can you think of any other financial institution which does this?) Several LIC offices now have been given more powers to settle claims quickly.

3. An increasing proportion of maturity claims is now settled on the due date itself. They start corresponding with the claimant a month or two in advance. With all the needed documents arriving well in time, they have no problem issuing the cheque on the due date. (LIC is the only financial institution which goes after clients thus to settle their dues.)

4. A campaign has been launched to make sure that policy-holders know what is required of them—like submitting proof of age, nominating the beneficiary and telling LIC about any change of address.

LIC has been able to bring down the ratio of unsettled claims from 33.99 per cent in 1967-68 to 15.10 per cent in 1977-78—a good record by itself. But the Corporation is not resting on its oars. There is continuous endeavour to improve on this ratio.

THE announcement that government has broadly accepted the recommendations of the Kothari Committee on recruitment policy and selection [illegible] for appointment to all-India services, and the explanations thereof [illegible] by the Chairman of the UPSC on the new system of [illegible]vice examinations, have evoked some 'concern' — especially [illegible] allow candidates to answer the examinations in 'any language [illegible]ed in the Eighth Schedule to the Constitution', in addition to E[illegible]. There have been apprehensions about further weakening of the 'Centre'. The other innovation in the conduct of these examinations is the abolition of the separate categories of examinations that have till now existed to distinguish the IAS/IFS, IPS and other police services, and the Central Services, and the replacing of them with a single, though far from 'integrated', system of two examinations consisting of a preliminary 'objective' examination (which would be of a qualifying nature) and a final written examination to be taken only by those who get through the qualifying round.

The reason for these changes, apparently, is that these would make the civil service examinations more broad-based. Thus, by introducing the preliminary examination which demands little specialised kind of preparation, 'a far larger number of candidates than at present might be induced to have a go' at taking the civil service examination; and by allowing for the questions to be answered in any 'Indian language', the resulting civil service would be less 'elitist', freed from the grip of the presently dominant anglicised sections.

These expectations are truly naive and even pathetic; but perhaps they are not meant to be taken seriously. For, if there were really any concern about the administrative system, something more material could have been done about the presently entrenched bureaucracy itself. Whatever be the other impact of the proposed changes, one thing is certain: there is going to be, as the UPSC chairman himself optimistically foresaw, a vast increase in the number of candidates hopefully having a whack at entering the rarefied world of higher bureaucracy. Since the standards set for passing this 'objective type' preliminary examination are admittedly modest, a very large number of these aspirants will also be taking the final 'written' examinations, thus providing a bonanza for those others who too are part of the whole paraphernalia of the examination system — the examiners, moderators, paper setters, supervisors, chairmen of interview boards, etc.

In fact, there is little justification for any 'concern' about the implications of the proposed changes in the system of civil service examinations. These changes have been introduced mainly to satisfy the demands of various new classes which have become vocal and powerful in the last 30 years, and who also want to acquire the kind of power that is being weilded by the present bureaucracy. But since the changes have themselves been initiated and formulated in their details by that very bureaucracy — a class which has a continuity going back at least to Moghul times — one may expect that the necessary safeguards have also been built into it to ensure that the system will in no way be radically threatened.

This is taken care of in two ways. First, the measure to broaden the class base of the candidates by having a preliminary examination can actually turn out to be a device to weed out candidates otherwise considered undesirable. Secondly, the opportunity provided to candidates to answer questions in English or in any 'Indian language' might actually make it possible for the system to distinguish, at the very outest, the kind of candidates who would effortlessly fit into the category and those who would not.

Too much can be made also of the other novel measure — the abolition of a separate category of examinations for the various services. The ostensible purpose of this measure it to abolish the kind of distinctions which continue to exist among the upper echelons of Indian bureaucracy between the so-called generalists and the so-called specialists — though other claimants to special talents, such as the so-called technocrats belonging to the higher levels of management in public sector undertakings, are also laying claim to being an interested party in the dispute. These distinctions are of course not actually related to any real or imagined special talents required to do the job of a district administrator, or a junior diplomat, or a police officer, or an officer in one of the myraid departments in the government of India. The distinctions are entirely based on the different and carefully graded [illegible]s traditionally offered to perform these varied jobs, and a mere [illegible]

jobs will not remove the festering jealousies in the services.

In one respect, however, the proposals do mark a departure. All the aspiring candidates now should answer a paper carrying 300 marks in one of the languages mentioned in the Eighth Schedule of the Constitution. Till now, no such compulsion attached to the taking of these examinations and many students, especially from the tribal areas who do not speak any of *the 15 languages mentioned in the* Eighth Schedule never experienced any disability on this count. (The total number of persons who *returned* one or other of the 15 languages mentioned in the Eighth Schedule as their mother tongue in the 1971 Census was about 48 crores, out of a total of about 55 crores.) Whether this measure will make them feel even more than they do now that they are not a part of the Indian mainstream merely because they are not proficient in any 'Indian language' is open to question. Indeed, 'Indian language' is defined so arbitrarily that Sanskrit which claims exactly 2,212 speakers (down from the 2,544 who, in 1961, claimed they spoke Sanskrit as their mother tongue) is an 'Indian language' while the many tribal languages spoken by millions of people do not qualify as 'Indian'. Certainly, the latter will suffer even graver handicaps in competing for civil service positions than they do now.

Labour

Misunderstood Case

SINCE the middle of last month when bank employees began their programme of non-co-operation, banking operations in the country have been considerably hampered; at the same time, the fact that even after over a month of such hampering and disruption (including the two-day strike at the end of last year), the economic life of the vast majority of the people has gone on in much about the same manner as before can perhaps give us a clue as to the scale of economic activity that can go on more or less entirely outside the whole organised money system.

The demands of the workers in the banking industry, despite all the talk of their being a labour aristocracy dwelling in high wage 'islands' and perpetually asking for a larger and larger slice of the cake, are not really for an increase in wages, though the time for *a revision of wages has been due for* some time. Shorn of inessentials, these demands boil down to two: a continuation of the existing formula for dearness allowance under which rise in cost of living was being neutralised, though not uniformly, in the case of various *categories* of workers; and secondly, restoration of bonus, a right which had been taken away during Emergency. What the Indian Banks Association is proposing is to radically alter the existing structure of dearness allowance and replace it with a new scheme where, broadly speaking, the 'protection' till now available against increases in cost of living would be eroded and, secondly, the dearness allowance would be delinked from the category of a worker and, instead, linked to the salary drawn by him. Moreover, what the bankers are seeking to achieve is to alter an arrangement existing for about 20 years.

A feature of the current struggle in the banking industry is the extraordinary passions that it seems to have roused among what is referred to in newspapers as the 'public'. There have beeen bundhs and hartals organised by the trading community, statements galore have been issued by spokesmen of organised industry, processions have been taken out against bankmen, and public meetings have been held where the so-called labour aristocracy has been taken to task. In Ahmedabad these 'popular protests' have erupted into violence on a wide scale. At the same time, 'solutions' almost diametrically opposed to one another have been offered — that the industry should be declared an 'essential service', and also that government should order a 'lock-out' of banks. There have also been warnings about an impending chaos with dark mutterings about heavy withdrawals leading to 'liquidity crisis'. And even as these threats and gloomy forecasts are being uttered, proposals have also been put forth that the whole issue should be placed for adjudication before a third party, a suggestion which once again is against the longstanding practice of disputes in the banking industry being resolved on a bipartite basis.

At the same time, if a widespread impression does prevail that the bank workers have been 'holding the country to ransom', and if trade and industry, with the tacit encouragement of government, are able to organise protests and processions against the banking workers, not merely do such actions follow the classic pattern of 'popular' mobilisation against the organised working class, but they also speak of a certain failure on the part of the working class itself to secure on its side what by any account ought to be its constituency. Clearly, if the Indian Banks Association's formula for dearness allowance is enforced and thus whatever protection against rising prices that a section of the organised working class had secured is taken away, and further this action is justified on the astonishing ground that such 'protection' is not available to other sections of the working class, it will not be long before the wages of these other sections of the working class will be subjected to fresh attacks. The workers in the banking industry should have more *emphatically* and convincingly demanded that the kind of 'protection' available to them should be made available to other sections of the working class too, and not merely to the so-called white collar workers, but also to factory workers. They should have more thoroughly exposed the wholly fallacious argument that it is the modest increase in wages that pushes up prices; that the propaganda about workers in the banking industry constituting a 'high wage island' — even if it were the case, which it is not, for about 70 per cent of workers in the banking industry draw less than Rs 565 per month — is really beside the point for these employed do in every case support a large number of unemployed; that far from asking the working class to surrender what it has gained after prolonged struggle, the employers should cut down the extremely lavish salaries and perquisites they have appropriated for themselves; that what is called for is not a cut in wages, nor even a freeze, but increased employment; and that the unemployed youngman who is enjoined to take part in a procession and shout slogans against a section of the organised working class is not advancing his plea for employment one bit. The workers in the banking industry have no doubt demonstrated their organisational strength; but what they have failed to do is to enlist the support and sympathy that should have been theirs.

National Income

Disturbing Trends

THE Central Statistical Organisation released last week its 'quick estimates' of national income for 1977-78 (see Statistics section of this issue). Taking the period from 1970-71 to 1977-78, certain tendencies highlighted by the national income data are worth nothing.

First, in four out of the seven years, per capita income in real terms registered an absolute reduction; and per capita consumption did the same in three years. As a result, the index of per capita income in 1977-78 stood at 108.6 (with base 1970-71=100), showing a compound growth rate of less than one per cent annually. More significantly, the index of per capita consumption stood at just 100.6 in 1977-78 and at 96 in the previous year. Except for 1971-72 and 1977-78, the index of per capita consumption always stood below 100, implying an absolute reduction in the per capita average real consumption over the level of 1970-71. Since there is ample evidence of rise in the consumption levels of the better-off section of the population — for instance, in the impressive rise in the production of goods and services demanded by this section — the stagnant average consumption levels indicate a further deterioration in the levels of living of the poor.

Secondly, aggregate saving has been growing at a faster rate than investment. While the index number of net domestic saving at current prices, with 1970-71 as the base, shot up to 319.4 in 1977-78, that of net domestic capital formation stood at 274.8 in the same year. For the three years from 1975-76 to 1977-78 net domestic saving as a proportion of net domestic product remained higher than the rate of net domestic capital formation. The difference between the two is reflected in the surplus in the current account of the country's balance of payments and the consequential outflow of saving abroad.

Thirdly, in the composition of national product, the decline in the share of agriculture during this period has been accompanied by an increase in the share not so much of the 'secondary' sector as of the 'services' sector. While the share of 'agriculture' in net domestic product at current prices declined from 447.2 per cent in 1970-71 to 39.6 per cent in 1977-78, that ... by 7.6 percentage points, ... the 'secondary' sector rose by only 3.8 percentage points from 19.3 per cent to 23.1 per cent. Within the 'secondary' sector, the share of the registered manufacturing sector limped up from just 8.5 per cent to 10 per cent.

Finally, the difference in the share of different sectors in net domestic product at current prices and at constant prices reflects broadly the shifts in relative prices. The data suggest that relative prices moved in favour of 'agriculture' between 1972-73 and 1974-75, in which years its share in net domestic product at 1970-71 prices was always lower than that at current prices. Thereafter, relative prices have tended to move in favour of the non-agricultural sectors, particularly the tertiary sectors.

Big Power Relations

A New Scenario

THE informal two-day summit of leaders of the US, West Germany, France and Britain at Guadaloupe (January 5-6) has served to highlight some of the Western, or rather, West European anxieties regarding the emerging pattern of relations between the US, China and Japan and, as part of this phenomenon, the possible setback to 'detente', between the US and the Soviet Union — a setback which would have its impact most directly and immediately in Western Europe itself. The Guadaloupe summit took place against the background of such recent developments as the normalisation of relations between the US and China, the apparent setback to the expected conclusion of the second agreement of limitation of strategic arms between the US and the Soviet Union, the putting off of Brezhnev's visit to Washington, the setback (to the West) in Iran and the apparent gains to the Soviet Union in Kampuchea — all part of broad Western security concern.

The United States has been trying to sell the line that its improved relations with China should not be construed as a part of any 'grand design' directed against the Soviet Union. By any yardstick, the kind of accommodation the United States seeks with the Soviet Union is, from the point of view of America's own self-interest, of greater consequence than the gains it hopes to make by normalising its relations ... same time, ... two, not ... points of view on the conduct of big power relations within the present US administration; the one, more conventional, which attaches greater importance to maintaining and improving the present relatively tension-free relations with the Soviet Union; and the other, more 'activist', which sees greater manoeuvrability available to the United States consequent upon the normalisation of Sino-US relations and which wants the fullest exploitation to be made of these new opportunities. There is no fundamental contradiction between these two points of view, and the present US administration is naturally pursuing both these ends — seeking further accommodation with the Soviet Union and, most importantly, arriving at an agreement on limitation of strategic arms and ensuring peace in Europe, and at the same time 'containing' the Soviet Union, especially outside Europe, by forging links with China and Japan, a link which could also well serve as a counter to the increasing economic power of Western Europe.

While no clear demarcation of attitudes was apparent at the Guadaloupe summit, certain broad differences that did emerge deserve to be noted. First, both Britain and France showed a distinct lack of enthusiasm for any move to involve them in a further agreement on limitation of strategic arms because such an agreement would curtail these countries' own nuclear weapon programme. Secondly Britain, which has contracted to sell 80 Harrier Jump Jet aircrafts, and France, which has contracted to sell about two billion dollars worth of anti-air missiles, to China refused to share whatever 'concern' the US and West Germany might claim to have about these huge arms contracts. West Germany seems to have been particularly concerned about these arms sales which, according to West Germany, cannot but be seen as acts of provocations against the Soviet Union. On Iran too, the European countries did not share the faith that the US apparently continues to repose in the Shah's ability to ride out the present storm and retain power.

What however is most interesting about the deliberations at Guadaloupe is the general caution on the part of the three Western powers about future US-Japan-China relations as envisaged by the more 'activist' of President Carter's foreign policy advisers. West Germany in particular seems to be alarmed at the prospect of any set-

back to the easing of tensions in Europe. France and Britain too share apprehensions about the potentiality of US-Japan-China relations — and not 'merely for purely 'political' reasons.

Kampuchea

Re-emergence of Sihanouk

A Correspondent writes:

AN immediate consequence of the overthrow of the Pol Pot government in Kampuchea by Vietnamese-led forces has been the reappearance of Norodom Sihanouk as a spokesman of Kampuchea. On his way to New York as the leader of the Kampuchean delegation to participate in the UN Security Council discussion on the developments in Kampuchea, Sihanouk stopped over in Beijing where he had meetings with Vice-Premier Deng Ziaoping and other Chinese leaders. At Beijing Sihanouk also addressed a six-hour press conference. His analysis of the developments in Kampuchea at the press conference, while of course it represents the views of a partisan in the struggle, is noteworthy for the light they shed on the possible future course of these developments.

On the involvement of Viet Nam in the overthrow of the government of the Kampuchean Communist Party, Sihanouk was categoric. "The Vietnamese are responsible for the aggression against Kampuchea, for the conquest of Kampuchea", he said at the press conference. He also accused the Soviet Union of being strongly involved in preparing and launching Viet Nam's aggression against Kampuchea. He said, "the USSR and Viet Nam had prepared the aggression against Kampuchea together when they signed their bilateral pact. Recently, in Moscow, they had studied the planning for the present aggression, invasion, occupation and colonisation of our country." He added, "Since many months, Russia has been sending everyday ships, planes, etc, transporting weapons... military equipment to Viet Nam, and also sophisticated planes, not only MiG 19s but MiG 21s."

A significant feature of Sihanouk's press conference was his attempt to focus attention on the consequences of the Kampuchean developments for the other countries of Southeast Asia. He said, "How can you be sure that the Vietnamese and Russians will be satisfied with the swallowing of Kampuchea? .... After swallowing Kampuchea, the appetite of the Russians, the Warsaw Pact and the Vietnamese will grow. They will threaten Thailand, and after swallowing Thailand, they will swallow Singapore and Malaysia as this is in the interest of Vietnamese imperialism and colonialism". Referring to Laos, Sihanouk said, "The Vietnamese do not respect the national sovereignty of Laos. And Laos is weak with a small population and a poor country, it cannot do much to safeguard its national sovereignty." From Viet Nam's treatment of first Laos and now Kampuchea, Sihanouk sought to draw the following lesson: "So you see it is very dangerous for Southeast Asia to let Viet Nam stay in Kampuchea and continue to occupy her, because Kampuchea will serve as a strong base for the Vietnamese, with the Russians behind them, to launch attacks against the countries in Southeast Asia".

Considerable interest also attaches to Sihanouk's statements about the Kampuchean Communist Party and the government of Pol Pot since under this government Sihanouk had been deprived of any political role in Kampuchea. Both by implication and even explicitly Sihanouk made it clear that he did not agree with the policies pursued by the Pol Pot government in Kampuchea. However, according to him this aspect of the matter had now receded into the background with the aggression from outside. "So we have put aside the question of human rights... and we unite our efforts in order to avoid the defeat of Kampuchean independence by Vietnamese and Soviet aggressive advancement." In this task he supported Pol Pot since "Pol Pot is symbolic of the legitimate status of Kampuchea". Significantly, Sihanouk also conceded the role of the Communist Party of Kampuchea and Pol Pot, its secretary, in the war against the United States. He said, "Led by the Communist Party of Kampuchea and its leader, Secretary Pol Pot, our people performed great military exploits during the war of national liberation from 1970 to 1975".

In regard to the policies of the Pol Pot government, while it was clear that in his view the government had infringed "human rights", Sihanouk conceded in his press conference: "I have been able to visit some provinces along the big lake. The people there work very hard. They are not unhappy. On the contrary, they smile. I hear songs, not love songs, but revolutionary songs. These songs are not so bad. The children play and freely eat bananas in the gardens of their co-operatives. The food in the co-operatives is not bad, though not as good as mine. The dining rooms are clean and the cooking is good. The people are not lean. They are well fed. The life there is good, really good. The rich are not so rich and the poor not so poor as before. This is a unification of the society and a social justice, and the majority of the people of Kampuchea like it."

'High Technology' in Drugs

THIS has reference to the article "Pharmaceutical Industry: In Quest of 'High Technology'" (*EPW*, September 30, 1978). It is no doubt true, as the author of the article says, that the new drug policy of the Government of India has unnecessarily raised an issue of great controversy by the introduction of the concept of 'high' technology for the maintenance of a higher level of foreign equity by the multinationals. In fact, the concept militates against the FERA guidelines in so far as no such distinction between 'high' and 'low' technology products has been made in the case of the other 18 core sector industries listed in the guildines. Under FERA, only trading companies are required to bring down their equity to 40 per cent forthwith, while others, including those producing low technology items like food-products, biscuits and tooth-paste are allowed to bring down their equity in stages. Even so, any definition of 'high' or 'low' technology, in the very nature of things, is bound to be subjective and arbitrary. No wonder, a Committee functioning under the chairmanship of the Secretary to the Ministry of Petroleum, Chemicals and Fertilisers to evolve a proper definition of what is "high" technology in drug manufacturing is still reportedly grappling with the question.

The concept of 'high' technology in drug manufacture, nevertheless, is only another name for the science of industrial production involving multi-stage processes like vitration, high-vacuum operations, fermentation, etc, and many of the drugs presently manufactured by the international units can come under this definition. Moreover, in the entire process of manufacturing a drug, not all the stages but only the ultimate or penultimate stages. might require technologically high or sophisticated treatment. The problem, thus, would be to restrict the foreign companies strictly to the area of high technology manufacture, to the exclusion of all other (less 'high') stages, in the entire process of manufacturing a drug. The practical application of this concept bristles with immense difficulties. 'High' or 'low' technology, again, has, sequentially, only a relative, and not an absolute reference and relevance; and in this sense, a technology may still be 'high' in a developing country in terms of cost and domestic R and D capabilities (whether innovative, adaptive or assimilative), even though it may have been discarded as 'obsolete' in a more advanced country. And, in the field of drugs and pharmaceuticals, product and process obsolescence is the greatest, needing quick replacement.

Thus, there can be no two opinions on the view expressed by the author that "in any competitive field, the technology employed must be the *best* technology, whether it is 'high' or 'low'". In other words, in a given situation of space and time, that technology may be deemed *best* which helps in realising higher production and productivity, lower costs and prices and, above all, better quality to the consumer — which really are what do matter in a competitive market. Such technology, however, which may be expected to produce the best results in terms of costs and prices, availability and quality, is directly related to the scale of manufacture — a factor which the author seems to have ignored. There is no gainsaying the fact that economies of scale are usually realised in a large organisation and that economic necessities have often tended to drive the smaller units towards merger. In India, however, government policy, over the years, has been wrongly to equate size with monopoly, and thus, to fragment capacities, which, in turn, has led to high cost structure, shortages, and high prices, not to speak of poor quality of products all around. Monopoly or oligopoly has reference only to the non-existence or inadequacy of competition in the economic system. In such a context, not only a large house but even a relatively small-sized firm can be monopolistic or oligopolistic, depending upon its product character, availability and market-sharing. In a competitive economy, however, size has both relevance and justification in terms of economic viability and the impact it makes on productivity, costs and prices, and quality.

Thus, the 'best' technology, (to produce the best results in terms of the above criteria) depends inevitably on the size of the plant and the scale of manufacture. In the field of drugs and pharmaceuticals, the economic size of a tetracycline plant, for example, is 50 tonnes, while the largest plant in the private sector in India today, has a capacity of only five tonnes. Even though the multinational drug firms are having the best technology, (as defined above), they are not allowed to reap the economies of scale on considerations other than economic. Even so, the cost of production of tetracycline, to quote the same example, is at least one-third less in the private sector, today, than that in the public sector, despite the uneconomic size of the private sector plants. In this context, *it is worth reflecting* whether any discrimination in equity dilution of foreign companies based on irrational and subjective considerations of 'high' and 'low' technology will help to bring in any worthwhile technology at all (not to speak of the best), for the further growth of the industry in India. The net result will be that we may be forced to shop around for technology, as the public sector units have been doing, with no assurance whatsoever of getting the best technology or at cheaper prices than through the existing channels of multinational corporations. The best technology is held by a few international corporations; and they are not likely to part with it for no consideration.

Thus, any rigid approach to the question of foreign equity and technology, with its concomitant of sectoral reservation of areas of drug production, as propounded in the new drug policy, may well prove counter-productive, leading to wasteful uses of scarce resources in investment in uneconomical, multiple units which could only result in pre-emption of large capacity licensed for these units on the one hand and high cost and price structure of the industry on the other — as experience in the country thus far has already shown. In fact, the cost of some of the bulk drugs produced in this country — chloramphenicol and tetracycline, for example — are at least 300 to 400 per cent more than the international prices. Again, the production of anti-infectious drugs (antibiotics and others), which is just about 25 per cent of the total production of drugs and pharmaceuticals, falls very short of the prevalence and incidence of diseases in a large country such as ours, mainly because the public sector, to which the production of these vitally needed drugs has been assigned, has failed to deliver goods.

The question, thus, is not whether the technology used is 'high' or 'low', indigenous or foreign, but whether it can be effectively utilised for the purposes in view.

Bombay.

Expanding Product Range

Hansavivek

GREAVES COTTON is stepping up dividend by two points to 12 per cent following slightly improved results in spite of labour unrest in one of its major subsidiaries, David Brown Greaves, and also in some suppliers' units for whom the company is concessionaire for their products. Profitability was also adversely affected due to loss of production resulting from shifting to Nasik the company's light engineering division and also in organising an all-India sales division to look after sales of Lombardini engines which are expected to make a sizeable contribution to the turnover from the current year. Looking to the order book, the directors feel optimistic about the current year's prospects. The company's Greavestool division has developed a new type of underground drilling rig which, when put into commercial production, will add substantially to the turnover. It has done well in exports. Greaves light engineering division commenced production at Nasik in April last and is expected to commence contributing to the company's earnings very shortly. The rock bit manufacturing plant at Nasik has been working below licensed capacity as the offtake of ONGC, the main customer, is low due to its holding large stocks of imported bits. As a measure of diversification, the plant has started manufacture of bits suitable for other drilling applications. The project division is negotiating with several government projects for large turnkey jobs and hopes to secure substantial contracts this year.

Among the associate companies, Greaves Foseco has maintained a leading position in the metallurgical industry. Greaves Dronsfield experienced a slight decrease in the offtake of emery fillets. Crompton Greaves maintained output at a high level and its turnover and profits showed substantial improvements despite severe competition. New India Fisheries' operations resulted in a loss. Uncertainties in regard to the future policies of government about the role of the larger business houses will be permitted to play in the development of the deep-sea fishing have discouraged the management from undertaking any major scheme of expansion. However, it purchased the two Japanese freezer trawlers it had obtained last year on a charter. These trawlers operating in the Bay of Bengal are expected to add substantially to the turnover and profitability of the company in the coming years. Greaves Lombardini commenced producion in September 1977 and built 3,000 diesel engines by the year ended June 1978, although it had to face difficulties in getting imported components. Production of indigenous components has been well established and it is expected that by the year-end dependence on imported components will be substantially reduced.

CHLORIDE INDIA has reduced non-resident interest in its share capital to slightly below 51 per cent by issu-

ing 9,38,100 equity shares of Rs 10 each at a premium of Rs 10 per share. Of these, 7,43,340 shares were offered as rights to existing Indian shareholders in the ratio 1:3, one lakh shares to LIC, UTI, ICICI, GIC and its subsidiaries and 94.760 shares to employees and the Indian directors. The company has taken in hand various expansion schemes involving a total outlay of about Rs 8 crores spread over a five-year period. These schemes will be financed by, apart from the recent equity issue, long term loans, government incentive and subsidy, and internal resources. Civil construction work for a 100 per cent export-oriented unit at Haldia is expected to start soon and it should be operational by mid-1980. Plans have also been developed for setting up a new unit for manufacture of various types of industrial batteries at Haldia adjacent to the 100 per cent export unit. The company has obtained permission of the state government to transfer existing licensed capacity for manufacture of various types of industrial batteries from Shamnagar to Haldia Construction work has also started at Haldia on the import substitution project for battery separators for captive use. Manufacturing facilities there are expected to be operational by April this year. Work has also been taken up for setting up manufacturing facilities for production of torpedo battery cells at the Chinchwad factory, and a plant for manufacture of battery containers for captive use at Haldia. Meanwhile, the company will be shortly putting the newly developed process for manufacture of a special grade of battery separator to commercial production.

The company has produced satisfactory results for 1977-78, despite production losses from power interruptions and labour unrest. Higher incidence of taxation as a result of disallowance of expenditure on advertising and withdrawal of export market development assistance has neutralised most of the improvement in profits Even so, dividend is well covered The storage battery market is becoming increasingly price conscious, but the company has been able to retain its market share by strengthening after-sales service facilities and maintaining high quality standards for its products. Export earnings increased by 5 per cent to Rs 4.19 crores, with USSR continuing to be the major customer. Chloride and Exide Batteries Eastern), the wholly-owned subsidiary, improved its turnover and profit after tax compared to the previous year, but it did not pay any dividend in view of the need to conserve resources for working capital requirements. The associate company, Mine Safety Appliances, had a successful year and declared a 15 per cent dividend for 1977-78 To achieve greater representation in the board of executives heading the various major functional areas, the company is seeking approval of the Company Law Board for appointment as wholetime directors the present heads of the research and development, manufacturing personnel, marketing and finance functions

GOLDEN TOBACCO produced and sold more at enhanced margins last year and earned a gross profit which was a fourth better compared to the previous year, but the incidence of tax liability has more than syphoned away the increase in profits, leaving a net profit of Rs 64 lakhs against Rs 98 lakhs in the preceding year — a drop of nearly one-third. Accordingly, dividend has been stepped down from 2 per cent to 10 per cent The reduced distribution is covered 1 28 times (1 63 times). The company achieved exports of cigarettes and tobacco of Rs 1 96 crores, against Rs 1 60 crores previously. Current sales have shown a further rise and the chairman and managing director, Chatrabhuj Narsee, expects the company to increase its share of the cigarette market in the country. As against installed capacity of 15,625 million cigarettes, the company produced 11,394 million pieces during 1977-78 and 10,309 million pieces during 1976-77 These production figures include 656 million pieces (449 million pieces) manufactured by others

MYSORE KIRLOSKAR's performance during the year ended June last has been adversely affected by a prolonged strike of 103 days during November 1977 to March 1978 and a power-cut of 55 per cent Sales were lower and margins came under pressure Gross profit fell from Rs 2.13 crores to Rs 1.50 crores, following reduced sales of Rs 12 11 crores, against Rs 14 63 crores, in the previous year Net profit tumbled from Rs 81 lakhs to Rs 33 lakhs and four-fifths of the equity distribution, lowered two points to 8 per cent was shortearned Export sales were Rs 1.97 crores representing 21 82 per cent of machine-tool sales as against Rs 2.06 crores, accounting for 18 per cent of machine-tool sales during the previous year. Export sales during the current year are expected to be better than during 1977-78. The home market for machine-tools and castings is also picking up and the board feels optimistic about the current year's overall results. During the current year the power-cut has been reduced to 30 per cent — which, however, is expected to continue during the major part of the year. Production and sales of the subsidiary, Precision Tooling Systems, is also improving in the current year.

RALLIWOLF, a subsidiary of Rallis India, has recently inaugurated a new self-contained research and development block It contains the latest equipment for measurement, analysis, environmental testing etc and also houses an entire laboratory with attached workshop and a complement of supporting services. The company is designing new products through a programme of research commenced some four years ago. It has already produced tools never before made in India, like the patented wire-wrapping gun, portable tapping machine and other sophisticated motor drives.

Ralliwolf was formed in 1958 through a technical and financial collaboration between Wolf Electric Tools of UK and Rallis India for manufacture of a range of portable electric tools The company steadily increased the indigenous content to 100 per cent in four years. These tools are used by railways, road transport undertakings, defence establishments, power stations large private sector industries, small-scale industries, and even domestic users. The company's products are also recognised for their quality in the UK, Canada, Australia, New Zealand and in the developing countries of Asia and Africa.

Corrections

(1) In the article "Serving God and Mammon in TTD" (*EPW*, January 6), p 15, col 3, line 16 from below, the expression "doctrine of cy pres" was wrongly printed as "doctrine of cypress".

(2) The name of the author, Satyendra S Naik, was inadvertently omitted in the article "Illegal Transactions in Trade and Payments in India: A Reply" (*EPW*, January 6, p 39).

The errors are regretted.

CPI(M)

Organisation before Politics

Ajit Roy

THE five-day plenary session of the CPI(M) central committee attended by elected delegates from various state organisations ended on December 31, 1978. Except for the last session in the afternoon of the last day, when three resolutions — on Stalin's birth centenary, regional autonomy for the tribal region in Tripura and the contemporary political situation — were adopted, the entire deliberations of the plenum were focused on organisational questions. Even though the political resolution on the contemporary situation represents some important — and welcome — shifts in the Party's political position, the passage of this resolution was rather marked by casualness. Not only did this resolution come at the fag end of the plenum session, no copies of the draft resolution had even been circulated among the delegates present.

The planning, procedure and products of the plenum seem to be based implicitly on the understanding that the CPI(M) has fully solved the problems of its political conduct, the only prerequisite for the Party's advance that is lacking at the moment being its organisational weakness. This reminds one of an earlier episode in the history of the pre-split CPI. In 1952, the then general secretary of the party, Ajoy Ghosh, had written an article in the Cominform organ, entitled "Some of Our Main Weaknesses". The article which was highly acclaimed by the world communist movement at that time as a piece of creative Marxism stressed that "...organisation, more so than ever before, has become a major political factor; it determines the tempo of the growth of the mass movement itself". It further stated:

> Today, . the difficulties are of a different nature. They arise primarily and above all from our organisational weakness. They arise *despite* correct immediate slogans and correct tactics as outlined in the Political Bureau resolution. Therefore, the organisation problem has to be tackled as the biggest political problem before the Party. (Emphasis in the original.)

During the next two or three years, however, it became clear to the leadership that the entire complex of the political formulations of the Party was based on erroneous foundations. The Party at that time refused to recognise the political independence of India; it characterised the ruling formation as "the government of financial sharks and speculators ... hanging on to the will of the British Commonwealth".

Soon thereafter, the Party had to give up the entire understanding, as noted above, and come out with a series of amendments to the Party Programme. From then on, the dominant leadership of the Party moved further towards a more positive evaluation of India's ruling elite on the ground that the government's "aim of industrialisation, defence of peace, defence and strengthening of freedom ... are national tasks which constitute the basis of unity with the bourgeoisie". This in turn led to a sharp division inside the Party between the Right and the Left trends, which ultimately culminated in the split of 1964.

This, of course, is not to suggest that the CPI(M) today faces any threat of a major split. The recent breakaways in Karnataka and Maharashtra are little more than local affairs. Despite the significant volume of dissidence in West Bengal CPI(M) — dessidence centering on minor tactical issues and the mode of organisational functioning — the basics of the present political line are not questioned by any significant segments of the Party. But, again, it should not be forgotten that in 1952 when Ajoy Ghosh had written his well known piece, the entire Party, except for some odd individuals here and there, were solidly united on the basis of the Party Programme, drawn up a short while ago in Moscow under the guidance of Joseph Stalin himself.

Anyway, its casual passage through the plenum session notwithstanding, the political resolution signifies some advance on the Political Resolution adopted by the tenth congress of the Party at Jullunder in April last year. The earlier resolution had discovered a dichotomy between the political and economic policies of the Janata party government: "While the government stands committed to the dismantling of the dictatorial framework, its economic policies announce their anti-democratic content." It further urged that "All democratic forces interested in eliminating the danger of dictatorship must counter the economic policies of the Janata party..." It visualised constructive-critical co-operation between the Janata party governments and the Left and democratic forces. It had laid down:

> The left and democratic forces press the Janata government for implementing the electoral promises *regarding democratic reforms*, for dismantling the framework of the Emergency period, and welcome all measures in fulfilment of these. They at the same time oppose and attack the government's vacillations, backsliding and prevarication and resist fresh attacks on the rights of the people.

The Jullunder resolution further held:

> ... the promises of the Janata party are valuable assets which must be fully utilised in the political struggle. And they can be utilised, because the radicalised sections behind the Janata — the very sections which suffered during the emergency — are not going to lend blind support to compromising policies.

The plenum resolution, by contrast, catalogues the backsliding of the Janata party government *all along the line* — at the political as well as the economic levels — and has rightly concluded that this backsliding has made it possible for the authoritarian forces headed by Indira Gandhi to launch an offensive. It concludes with a full-throated call "upon all Party units to strive for united mobilisation of the people along with other Left and democratic forces ... and thus facilitate the emergence of a powerful Left and democratic alternative".

The plenum resolution has not, however, made a complete break with the Party's previous simplistic understanding of the nature of the Janata party. It still holds: "In the absence of a cohesive socio-economic policy in the interest of the toiling masses ... personal rivalries of leaders had come on top." This betrays some grave illusions, in as much as it suggests the existence of an objective basis for the Janata party to evolve progressive and cohesive policies. Further, it fails to see the conflicts of social forces which form the background to the personal rivalries of the Janata party leaders.

On organisational questions, the plenum has certainly made some contributions. Not only had the leadership seen to it that known critics of the existing set-up had adequate representation in the plenum, the critics were also given a patient hearing. Modalities for a more harmonious working of the Party have also been worked out. All this suggests that the central leadership has asserted its leading role *vis-a-vis* the West Bengal state leadership

to a degree, never witnessed since the formation of the CPI(M) in 1964.

But these organisational innovations cannot significantly help the Party achieve its immediate goal of a major breakthrough in the Hindi-speaking heartland of India. This is so because the political dimensions of this task, viz, a sharpening of the political line and a close integration of the organisational and political work have been neglected by the plenum. Indeed, the priority assigned to the organisational discussion (without having laid a proper background through an uptodate political analysis) and a very formal endorsement of the political resolution at the fag end of the session amount to putting the cart before the horse.

Another rather disturbing development is the plenum's resolution on Stalin and the spate of highly laudatory speeches on this subject on various occasions preceding, during and following the plenum. The resolution and speeches on the whole glorify Stalin and hail him as a great Marxist. Is the CPI(M) leadership fully acquainted with the voluminous work done by Marxists the world over for an in-depth dialectical evaluation of the so-called Stalin phenomenon? There is no evidence at all that at any time in all these years the CPI(M) leadership has made any serious attempt at re-evaluating Stalin. Yet no working class party can succeed in deepening its Marxist character without fully grasping the weaknesses of Stalin precisely *as a Marxist*. More immediately, the present spate of the one-sided glorification of Stalin may even create problems for the realisation of a wide Left and democratic front, set as the tactical goal of the Party.

BOMBAY

Fiddling with FSI

Amrita Abraham

THE population of Bombay has already outstripped the projections on which the development of the metropolis has been planned so far. By 1975 the population had crossed the estimate for 1981. It is now 7.5 million. This fact has not got the government pressing any panic buttons. Officials continue to believe that growth and development, especially of the island city, can be kept within 'manageable proportions'. This means nothing more radical than pegging new construction to "the existing pattern of development and civic services".

One of the instruments in the last twenty years to regulate building has been the floor space index (FSI, the ratio of built up area to plot area). First under the Bombay Town Planning Act 1954 and later under the Maharashtra Regional and Town Planning Act 1966, FSI has been laid down on a zone-wise basis for the city and suburbs. The Development Control Rules now delineate ten zones with varying FSIs. The island city by and large has FSIs of 1.33 and 1.66, the suburbs 1.00 and some areas like Chembur and Powai for reasons of pollution and security have FSIs lower than 1.00.

However, the restriction of new residential and commercial accommodation is not an absolute principle. The government first succumbed to the pressures of the building lobby and booming land prices and extended the area for new construction by land reclamation at the southernmost end of the island city. Then in order to recover the cost of this most expensive real estate it permitted a higher FSI than anything the city has ever known. Despite all the alarms that are being sounded, the situation continues. Backbay Reclamation Scheme Blocks I and II have an FSI of 2.5; Blocks III to VI, Cuffe Parade and a few other areas have an FSI of 3.5. At one point the FSI at Nariman Point was 4.5 before an ordinance in 1965 finally brought it down to 3.5 but this was not before Air India, Nirmal and Express Towers buildings were granted the higher index. Likewise, land reclaimed by the Maharashtra Housing Board in Mahim Creek at Bandra West and similar reclamation in the central commercial zone in Bandra East has an FSI of 2.00.

From this pattern it is clear that overpopulation, the strain on civic services, lopsided regional development and so on are only so many shibboleths and that the government has totally other priorities in mind. The Development Control Rules also make exceptions in the cases of educational, medical, government and semi-government establishments as well as luxury hotels, all of which may exceed the FSI laid down for the zones. The logic here (apart from the hotels) is the need to meet the city's demand for various kinds of services. But since the 'city' itself is not static, the two chase each other in a rising spiral.

Like other controls, FSI has had the effect of providing extremely attractive opportunities for those private builders who can find a way round the regulations. A recent newspaper report shows that residential flats have quadrupled in price in the last five years and this is an indication of how lucrative the business can be for those who know how to capitalise on it. The ways in which FSI regulations have been got round are cloaked in quasi-legal arrangements. As a building engineer said, "There is no way that FSI can be openly violated because once the building is up it is there as concrete proof for everyone to see."

Builders' endeavours coinciding with the government's soft approach to the question have created a vast grey area of uncertainty in FSI regulations. This is exacerbated by the conflict of authority between municipal commissioner, municipal corporation, the Bombay Metropolitan Regional Development Authority and the state government. This is probably why a development officer of the Municipal Corporation said that there can be no violations of FSI, only differences of interpretation.

At present there are two sets of notifications about FSI in force in the island city. One is BMRDA's notification of June 1977 and the other lies in the Development Control Rules.

BMRDA is empowered to decide whether any proposed development by any person or authority within the Metropolitan Region would adversely affect the integral development of the Region. It made two crucial rulings in June 1977. The first was that no construction or reconstruction of office premises or wholesale establishments should take place in the city of Bombay without prior permission of BMRDA. The second laid down that no other construction or reconstruction of any building is to have an FSI exceeding 1.33. The Bombay Building Repairs and Reconstruction Board was exempted as were educational and medical establishments put up by government, local authority or public charitable trusts.

Subsection 4 of Section 13 of the BMRDA Act of 1974 however provides for appeal against BMRDA decisions to the state government. In the year since BMRDA's notification 25 appeals have been upheld by the government. Three of these instances have since

become notorious and highlight the conflict of authority between BMRDA whose chairman is the Minister of Urban Development and the state government, and the difference in the intentions of the two authorities about the development of the southern tip of the city. The government is still committed to continued but 'planned' growth — the restrictions enhance the value of its sole right to waive them as it thinks fit. In the absence of any clearcut policy this means that it is free to exercise power arbitrarily. BMRDA on the other hand is committed in no uncertain terms to a temporary freeze on construction in south Bombay.

East India Hotels applied for permission to build floor space of 30,500 sq m on two plots adjacent to their existing hotel, the Oberoi-Sheraton, at Nariman Point. This would amount to an FSI of 4.5 which together with the present hotel which has an FSI of 5.68, would give the whole complex an FSI of 5.15. The hotel's case for a higher index lay in its argument that the new construction is part of a phased programme, that several facilities such as restaurants, shops, lifts, etc, in the present building would only be fully utilised when additional hotel rooms were built. BMRDA noted however that nearly one quarter of the new construction would actually go in shops, restaurants and an airline office. The airline office alone was allocated 66,000 sq ft which BMRDA said could not be justified as an essential amenity for hotel guests. The strain on transport and other services at this southern end of the city outweighed the hotel's plea of catering to additional tourist traffic and its application was rejected. Scarcely 20 days later and a mere 24 hours before the Assembly elections last February, the government overrode BMRDA and gave the hotel permission to build with an FSI of 4.5.

At that time Vasantrao Patil's government also upheld the appeals of *Free Press Journal* and the Maharashtra Rajya Sahakari Sakhar Karkhana Sangh (a federation of sugar co-operatives). Both applications to build at Nariman Point with FSIs of 3.5 each had been rejected by BMRDA. *Free Press* proposed to build office space for 5,000 employees (not its own) as well as to accommodate some 300 of its own employees and an unspecified expansion of its staff. The MRSSKS proposed to use 1,800 sq m of its new building for its members, rent out 1,500 sq m for a BEST substation and rent out the rest, some 5,000 sq m, as office accommodation.

In both cases it was clear that there were no essential, public or other inherent reasons why these private groups should be given permission to build at Nariman Point. Their major intention, BMRDA's Executive Committee noted, was "commercial utilisation of the FSI".

The former chief minister defended these three cases by saying that BMRDA had no authority to "flout commitments made by the government". The commitments amounted to rentals of Rs 7,500 per sq m that these parties had been paying, Vasantdada is reported to have said. This is a dubious statement. A Janata MLA in the House and the Save Bombay Committee have pointed out that normal procedure for allotting land at Nariman Point is to lease land on an annual rental equivalent to the interest at 6 per cent on the rateable value of the property. This works out to an annual rent of Rs 450 per sq m and is not payable in any case till buildings have come up. Given that BMRDA's notification had changed the situation fundamentally, how tenable are such 'past commitments' which moreover were not formal but apparently were given on an individual to individual basis?

East India Hotels had in its application to BMRDA also used the 'past commitment' plea and the Executive Committee had not found it relevant or tenable in law. The Committee felt that the change in law brought about by its notification was binding on all alike regardless of past commitments from the government or any other person.

None of this carried any weight then. Now the Sharad Pawar government has dropped the former ministry's proposal to increase the FSI in the city and suburbs to 1.66 and 1.33, respectively. But, asked about the cases in Nariman Point, Pawar had recourse to legalisms. "The absence of any provision in the BMRDA Act to review or revoke a decision by the state government" is the reason given to the Save Bombay Committee for BMRDA's inability to do anything. But the law has been known to take account of commonsense viewpoints and it is certainly open to question whether an outgoing cabinet's decisions are *bona fide*.

The issue is summed up by a local architect who said, when asked about violations in FSI, "As long as the final decisions lie with politicians everything is possible under the guise of public interest". An independent tribunal to hear appeals on BMRDA's decisions has been suggested as one way of reducing the scope for corruption and arbitrary decisions.

From an examination of the other 22 cases where the government has overruled BMRDA there appears to be no clear rationale for its decisions. One piece of logic that seems to prevail however is leniency towards projects that will provide residential accommodation. But here two problems have not been resolved. One: what kind of accommodation and for whom? Two: many builders present proposals in which the cost of building residential units is partially offset by the inclusion of some commercial units such as shops or office space. Thus Gokak Patel Volkart have been given an FSI of 2.45 in Colaba for residential accommodation for 60 company executives. Another builder in A Ward has been allowed an FSI of 2.45 for a proposal which will convert existing residential accommodation to commercial use and provide additional construction for residential use.

If the FSI laid down by BMRDA is flouted constantly, even within the terms of the Development Control Rules there are peculiarities. Since the rules provide for exceptions where FSI may be exceeded, projects have come up where they have been redesignated to fit the rules or where multiple-use circumvents the rules. An example of the first type is the new Stock Exchange building at Dalal street. The then Urban Development Minister in the early 70s reportedly persuaded the Municipal Commissioner to designate the Stock Exchange a public utility and it was then given an FSI of 5.2 in an area where it is 2.45.

The Haj building at Bori Bunder is only one of many projects where the multiple-use factor is in operation. As a religious institution it was apparently allowed a higher FSI than the surrounding area. But the project includes provision of a large number of shops, despite the fact that it is located within a stone's throw of one of the major markets in the city. Further, Vasantrao Patil's government had actually toyed with the idea of decongesting that very same area by relocating wholesale cloth merchants at the Bandra-Kurla complex.

The most ingenious example of the multiple-use device is the Ashoka Shopping Centre which is coming up in the premises of the GT Hospital in the high density Crawford Market area. The proposal was to plough part of the profits of the shopping

centre into the hospital's much-needed renovation and expansion. Here was supposed to be a true marriage of public and private interest. The complex consists of hospital, residential accommodation and shops. An FSI of 3.949 has been permitted because medical establishments are exempt from FSI regulations. So, a private builder can put up 53,800 sq ft of shops which are selling at Rs 1,800 per sq ft (on the ground floor) and 80,000 sq ft for residential accommodation, besides getting the contract to build the hospital.

The Bombay Building Repairs and Reconstruction Board is allowed an FSI almost twice that of the building that is to be replaced. This was the cue for private builders to get higher FSIs by designating reconstruction for residentail use quite inaccurately. A new building at Gamdevi was given an FSI of 2.5 (instead of 1.33) because tenants had to be reaccommodated in the new premises. (Here again the feasibility of the project depended on shops on the ground floor.) But the original building did not have any regular tenants at all.

Another loophole in FSI regulations comes about because of commencement certificates. Since there is no bar other than minor penalties for not putting up a structure within a limited period, builders can use a higher FSI even after it has been cut down in a particular zone. This has in fact happened in the case of Naaz cinema which was given permission in 1962 for expansion. In 1977 BMC received penalties for 15 years non-utilisation of the commencement certificate and the theatre continues to have the right to use a higher FSI than 1.66 prescribed for the area since 1966 or so. When BMRDA issued its notification there were several attempts to get backdated commencement certificates lest the new rules come into force.

Heera Panna building at Haji Ali is another example of the grey areas in FSI regulations. The plot falls between two FSI zones 1.66 and 1.33. A former municipal commissioner chose to allow the builders the higher index over the whole plot.

Some of the most ingenious schemes have originated in the business/bureaucratic complex in this city. One such scheme was the floating FSI. Here the principle of FSI as an instrument to regulate growth in all parts of the city was given the go-by and builders were alowed to exceed the FSI laid down for commercial and residential buildings anywhere they chose in return for services rendered to the Municipal Corporation.

In origin the idea was that when the Corporation acquired land for civic purposes (roads, usually), to the FSI allowed on a *contiguous* plot could be added additional FSI equivalent to what was lost on the land taken over by the civic body. But the floating FSI scheme was a conceptual leap that permitted additional FSI anywhere else in the city in compensation for FSI lost by handing over land to the Corporation free and clear of encumbrances somewhere else. From 1969 onwards, for five years, the proposal shuttled back and forth between Corporation and state government over some minor modifications. Even before it was formally sanctioned a former municipal commissioner went ahead and took over gifts of land allowing 16 builders additional FSI anywhere else in the city. A public uproar (stoked, a corporation official said cynically, by the envy of other builders) brought this scheme to a halt. After July 1975, according to an officer in the development office, floating FSI was discontinued. But suspicions about the continuation of the scheme ran well into 1978 and prompted the Save Bombay Committee among others to seek official confirmation of this. Apparently the Municipal Commissioner wrote to the Committee in the last quarter of 1978 saying the scheme was not in operation any more.

Even so, Corporation officials today seem strangely reluctant to disclose details of the scheme, who benefited, what the quality of land gifted to the Corporation was, where additional FSI was put to use, etc. All questions here come up against an edifice of half information, prevarication, and specious argument. A development official in the Corporation would only say that land was relinquished in areas like Andheri, Ghatkopar, Versova and Kurla, and floating or additional FSI was utilised in areas like Bandra, and Kurla, which are the more expensive suburbs. He said categorically that it was not utilised south of Mahim and Sion. In the absence of evidence here a layman can be forgiven for wondering how some high-rise apartment buildings have come up in areas in south Bombay where the FSI is just 1.33.

On being pressed the development office agreed to disclose the location of the plots (survey nos, etc) acquired by them under the scheme and the purposes to which they are being put. Half of the 16 plots have been acquired solely or in combination with other uses for gardens. Other stated uses are roads, public housing, municipal markets, etc.

The office refused to divulge the names of the people from whom the land was acquired because, a Deputy Municipal Commissioner said, there was a case in the High Court concerning one of the plots! However, the office confirmed that all 16 plots were acquired from builders and that all the plots were marked on the Development Plan for civic use (hence indicating that the civic uses were not invented merely for the scheme). It would have helped to know who the builders were because now the suspicion in the city that two or three builders cornered the deal cannot be refuted.

Three plots selected at random from the Corporation's list were checked out from taluka land records. They showed that the plots belonged to private individuals and not to builders' companies. And yet the Corporation said that all had been acquired from builders Therefore, what seems to have happened, assuming that the plots were in fact marked on the Development Plan (which means that their market values had crashed) is that between the proposal submitted to the Collectorate by the Corporation about its intention to acquire the lands and the issue of notification of acquisition under section 4 of the Land Acquisition Act, the builders moved in. The floating FSI scheme was invented, builders acquired the land at rock bottom prices (since private owners could not make monetary use of a floating FSI), handed it over free to the Corporation and used the additional FSI for building in more expensive areas of the city.

One of the reasons why the development office was so shy about revealing details of the FSI scheme has now surfaced. The government has apparently issued a directive to the Corporation early this year to stop the scheme forthwith. The problem is does the ban cover those builders who have already been granted floating FSI but not availed of it yet, no doubt because the value increases at a geometric rate every year? Will the Corporation's past commitments have to be honoured, whether land gifted to it has been developed or not? If the city and its corporators were told which builders have not utilised their special FSI and how many plots the Corporation has developed, it might be possible to resolve this problem before the business/bureaucratic complex comes up with a solution of its own.

CALCUTTA

Press Workers' Strike

Timir Basu

SOME one lakh workers of printing presses and allied industries throughout West Bengal have been on strike since December 13, 1978. The strike has already made its impact. Railings and walls, 'owned' by wayside hawkers, are less decorated with calendars and diaries, and College Street, the centre of the book trade in Calcutta, is virtually on the brink. Most students will have to start their new academic sessions without text-books. Readers of journals and periodicals will miss their copies for weeks to come since the All Bengal Convention of Printing and Allied Industries and the West Bengal Master Printers' Association, the two principal organisations of employers, have reiterated their determination not to start a dialogue over the workers' demands.

The strike has been total. This is the first time that printing workers have succeeded in withholding their labour for such a long time. Had the managements, in effect the Master Printers' Association, shown a little reasonableness the strike could have been averted. The workers' decision to go on indefinite strike was not sudden or unexpected. In fact the miserable living conditions of the workers in this old industry beggers description and is obvious to anyone who takes the trouble to travel the dark lanes and bylanes and near-slum areas where the printing units are mostly located.

West Bengal has some 7,000 printing establishments, of which Calcutta alone accounts for about 3,000, including established big enterprises like Swaraswati Press, Radiant Process, Lal Chand, Calcutta Phototype, Ganges, Hooghly, etc. The West Bengal Master Printers' Association headed by Radiant Process, and the Convention of Printing and Allied Industries under the sway of Swaraswati Press, decide the destiny of the printing industry in the state. The small press owners, though mostly outside these associations, can hardly defy the line laid down by them.

The Press Karmachari Jukta Sangram Committee — a united platform comprising the CPI(M)-led Federation of Printing Press and Allied Firms' Employees' Union, the RSP-led Press Employees' Association and the West Bengal Press Workers' and Employees' Union, having no allegiance to any political party or central trade union body — submitted a 12-point charter of demands in February 1978. The demands include upward revision of pay-scales, house rent allowance, introduction of Employees State Insurance and provident fund in all establishments as required by law, fixation of standard working hours, payment of dearness allowance on a reasonable basis, gratuity as per the Act and abolition of piece-rate system.

The charter of demands, adopted at a joint convention under the auspices of the Sangram Committee, was mainly aimed at regularising and standardising the pay structure and categorising the printing presses, block-making units, type foundry, roller casting, card board box manufacturing, waxing, varnishing, packaging and binding units according to size of business and strength of work force. The Unions have demanded categorisation into four types and fixation of wages accordingly. Small units with one to 19 workers are placed in the lowest group while establishments employing 200 and more workmen have been classified as the biggest units.

The demand for categorisation is the main bone of contention. The big employers are ready to discuss everything except the graded scale. There has been no revision of grades of press workers, despite repeated representations by workmen, since 1948 when the press tribunal awarded a pay-scale with increments at the rate of half a rupee per annum. But even that scale, though ridiculous in the context to current price levels, has not been followed in most establishments.

Meanwhile, the government of West Bengal fixed the minimum wage for printing employees at Rs 30 per month in 1965. This again was ignored by a large number of units. In any case, the minimum wage fixed some 13 years ago should have been revised twice by this time as per the law, but this has not been done. Sensing the growing discontent among workmen, the state government set up a tribunal in 1967 to go into the problems of the workmen of this industry and grant whatever relief it thought fit. But, thanks to the inefficiency of the labour directorate, the very order of reference was quashed on technical grounds before the tribunal got down to its task.

Press workmen, though poorly organised in comparison to their counterparts in other organised industries, launched an agitation for upward revision of wages in 1972, on the eve of the AICC session at Salt Lake The agitation culminated in a strike. The then Congress government declared the strike illegal after nine days, invoking the DIR. At the same time, it announced an interim increase of Rs 16 per month in the wages of workmen. But employers challenged the order in the High Court and obtained an injunction, thereby defeating the interim increase. Thereafter, though workmen agitated time and again, nothing noteworthy happened.

That wages and service conditions in the printing industry, fixed some 30 years ago, need drastic modification can hardly be disputed. ESI and PF are unknown in most units, piece-rating is rampant, working hours have no limits, overtime is unheard of in most units and even the large ones pay much less than the norms, dearness allowance, where paid, is computed on an obsolete basis, there is no security of service and victimisation is frequent. Against this backdrop, the workers began their agitation in early 1978. All attempts to bring about a negotiated settlement proved abortive, because of the non-co-operation of employers. Before resorting to the indefinite strike from December 13, 1978, workers had earlier gone on token strikes on August 29 and 30 without any effect.

The large employers' response to the charter of demands is indeed noteworthy. They want all employers, irrespective of their capacity and size, to implement the Minimum Wages Act and beyond that they refuse to negotiate with the workmen. If you do not have the capacity to pay the minimum wage, you have no right to exist, said one spokesman of the large units recently. This is an alibi for the large units to avoid the workers' major demand, i e, upward revision of the grade scales. And if insistence on minimum wages forces small owners to wind up business, so much the better for the large ones.

In the circumstances, the contradiction between big and small employers has inevitably sharpened, resulting in a split in the Employers' Association. Now

a new organisation under the name of West Bengal Printers' and Binders' Association has sprung up to protect the interests of the small owners The attitude taken by the big units amounts to negation of the demand of categorisation and an industry-wise settlement, irrespective of size, will lead to closure of a large number of small units.

A large number of printing units officially employ just nine workmen, the rest are employed as contract labour to evade the Factory Act and other statutory obligations. Interestingly, even 'communist' owners resort to such unfair labour practices. The British rehabilitated a number of 'terrorists' who abjured violence in the printing industry and these people think they have every right to violate laws and exploit workers, supposedly in the larger interests of the working class.

Printing workers work in unhygienic conditions, have no protection against health hazards, swallow lead poison year after year and destroy their eyesight in insufficient light. And yet the all-inclusive pay of an unskilled worker even in big firms is just Rs 191.20 per month, while skilled hands get Rs 251.20 per month. About the small units the less said the better. There even machinemen earn between Rs 150 and Rs 180 per month. The workers now want the monthly salary to be raised to Rs 370 per month for unskilled workers, whereas employers have so far offered just Rs 10 a month as interim payment.

PUNJAB

Struggle of Unemployed Teachers

Sucha Singh Gill

THE problem of unemployment has emerged as more serious at the end of every successive Five-Year Plan. With the spread of education, the problem of educated unemployment has also assumed grave proportions. In Punjab a section of the educated unemployed have organised themselves under the Unemployed Teachers' Union (UTU) This Union has recently led a militant mass movement for acceptance of the demands of the unemployed and of teachers employed on *ad hoc* basis. There are about 45,000 unemployed teachers in Punjab at present.

The process of organisation of unemployed teachers started in 1972. Some teachers met at Ludhiana and formed the Unemployed Teachers Union, Punjab, with Vasudev Kanwal as its president. Attempts were made to develop the organisation at the grassroots level. A constitution was prepared and a declaration analysing the problem of unemployment and linking it with exploitative economic system was passed at a conference in Jullundur in December 1974.

From the very beginning, a struggle between the two groups, representing two lines, started within the UTU. One group, known as the Rana group was associated with the Employees' Federation and was linked to the CPI(M): the other group, more radical, claimed to be independent Left. The dispute was over the declaration and the constitution of the UTU. The Rana group maintained that there was no need for a detailed declaration. Secondly, it objected to the use of the expression 'social-imperialism' in regard to the Soviet Union. There were also some differences over the constitution. Both the constitution and the declaration were, however, passed by a majority of votes. This led to the division of the Union. Both the groups organised their separate unions under the same name The two unions organised state level demonstrations separately in the beginning of 1975.

Though the organisation was sharply divided, struggles were launched at some district headquarters, the most important being at Ferozepore. The Union organised Jagrata (slogan shouting) at night against the District Educational Officer (DEO) of Ferozepore in front of her residence. The organisation of Jagrata at night has now become a popular form of a militant mass action.

With the declaration of the Emergency in June 1975 and the suppression of democratic rights, the mass movement suffered an eclipse. But the distinction between the two lines within the UTU became clearer. The Rana group, in line with the CPI(M)'s politics, adopted the policy of lying low with the intention of saving its cadres. The other group, though not very active yet, followed a policy of opposition to the Emergency. It passed a resolution demanding unconditional release of the arrested persons and restoration of civil liberties, The resolution was circulated among the teachers and was, along with a charter of demands, signed by 7,000 teachers, and both were submitted to the then Chief Minister, Giani Zail Singh. Mass deputations to DEOs were organised. The Rana group limited itself to submitting the charter of demands to DEOs by its leaders only.

As a result of opposition to the Emergency, the general secretary of the independent Left Union, Gurdial Singh, and the secretary of the Sangrur unit, Jiwan Lal, and 15 other members were arrested under the DIR. The services of Tek Chand Kalia were terminated. Many members were transferred. The group which actively opposed the Emergency faced victimisation in various forms.

With the defeat of the Congress in the elections of March 1977 and lifting of the Emergency, conditions again became favourable for mass movements. Both the Unions began to function openly. But there was mass pressure from below for unity of the movement and the leaderships of the two unions were compelled to hold unity talks Ultimately, a single union of unemployed teachers emerged, headed by an *ad hoc* committee of eight members. The declaration was made briefer and those parts to which the Rana group had objections were deleted. But the constitution of the Union remained the same. The united Union started its first mass action in the form of a dharna in front of the State Secretariat on August 10, 1977.

Elections to the Union were held on November 6, 1977. The contest was between the Rana group and the other group, which had by now begun to be known as the Lambi group. In the elections the Lambi group emerged victorious in seven districts and the Rana group in four districts and in one district the two groups were even. As a result, the Lambi group got a majority in the State Committee and got elected Hakam Singh as General Secretary and Labh Singh as President.

The elected leadership then chalked out a programme. At the first stage, it concentrated on the struggle at the district level, largely related to demands relating to the DEOs. There were some struggles, almost in every district, but those at Ferozepore and Faridkot were more prominent. At both these places the DEOs were gheraoed. The main demands of the unemployed teachers were, however, concerned with the state government.

The Union organised a state-level demonstration at Jullundur on January 22, 1978 in which 20,000 teachers participated. From March 13 to 16, 1978 the Union staged dharna in front of DPI (Schools) in the day and jagrata in front of the residence of the Education Minister at night. As a result of this, the following two demands of the unemployed teachers were accepted:

(1) teachers employed on *ad hoc* basis were given leave of all types on parity with regular teachers; and

(2) it was conceded by the DPI that, for regularisation, the *ad hoc* teachers would no longer be required to submit medical certificates and regularisation would not be subject to ACR (Annual Confidential Report) and police verification.

The Unemployed Teachers Union also supported the struggle of the employees of the Food and Supplies Department to be reinstated at Chandigarh. With the active support of the UTU, these employees, numbering about 200, were reinstated.

Upto April 1978, it was mainly the *ad hoc* teachers who participated in the UTU struggles and the emphasis was also on their demands. But in the second phase, the participation of unemployed teachers, particularly physical education and art and craft teachers, increased. This was reflected in the demonstration of unemployed teachers at Chandigarh in June 1978, in which about 10,000 teachers participated. After this demonstration, the Union launched a struggle in the form of dharna in front of the Punjab Civil Secretariat and jagrata in front of the Chief Minister's residence, which continued from September 11 to 15, 1978. During that time, teachers holding jagrata in front of the Chief Minister's residence began to be arrested even without the promulgation of section 144. After September 15, the teachers continued their struggle in this form on every Thursday.

More than 2,000 persons, including 85 lady teachers and 17 children, were arrested and put in various jails. In this phase of the struggle, about seven organisations extended their support to the UTU through their members courting arrest. These organisations belong to different shades of the Left in Punjab. Apart from active support, various Left and democratic organisations expressed their solidarity with the movement and urged the state government to accept the UTU's demands.

A significant part of the agitation of unemployed teachers has been their struggle in the jails. Before every batch of agitators was arrested, it had an action committee to co-ordinate its activities in the jail. As a result of the pre-planned formation of the committees, the struggle in the jail could start as soon as the teachers were arrested and they had any problems.

The struggle in the jails started after September 28, 1978. A batch of teachers was arrested at Chandigarh on that day, consisting of 48 lady teachers and 190 male teachers, and were sent to Patiala jail. They were treated as ordinary criminals. This was resented by the teachers. The Action Committee organised a mass hunger strike on September 29. All the teachers, male and female, and even children went on hunger strike for 36 hours. Their demands included B class treatment, better diet, etc. The demands were accepted, but all of them were released in the evening of September 30.

All the teachers, along with children, went to Chandigarh on October 1, 1978 and staged a dharna in front of the Chief Minister's residence. This was the first time that peacefully demonstrating unemployed teachers, including ladies, were lathi-charged. Later on all of them were arrested and sent to Ambala Jail. In this jail also, the teachers started their struggle for B class facilities and for open interviews with visitors. When the teachers organised a dharna in the jail, their demands were conceded. Similar struggles also took place in jails in Ferozepore and Sangrur and in all these places the demands of the teachers were accepted immediately.

The exception was Patiala, where the demands were not accepted. The struggle in Patiala jail, therefore, continued. From October 31 to November 3 each day a batch of 25 teachers were on hunger strike. The jail authorities retaliated by keeping all the teachers in total lock up. On November 23 all the teachers, numbering more than 800, staged a mass dharna and the next day they again organised a dharna in the jail. The jail authorities made preparations for mass repression. At about 2.35 pm on November 29 the jail warders armed with lathis along with convicts armed with firewood attacked the teachers sitting on dharna. The unarmed teachers were mercilessly beaten. The members of the Action Committee and the more active teachers were the main target of the attack. To terrorise the teachers further, the alarm siren was sounded and 24 shots were fired in the air. As a result of the attack, 34 teachers were injured seriously and had to be admitted to hospital. More than 100 other teachers received minor injuries and and lathi blows. The teachers also lost many watches, turbans and clothes, etc. The district authorities instituted a magisterial enquiry into the incident. All the teachers went on hunger strike on November 25. The Action Committee was then invited by the jail authorities for a dialogue and all the demands were conceded. The hunger strike was withdrawn after this.

There was outright condemnation of jail authorities throughout the state for the incident of November 24. The Democratic Rights and Civil Liberties Committee has appointed an Enquiry Committee to enquire into the incident. The struggle in the jail has shown that, though jails in Punjab are now called 'sudhar ghars' (reform houses), the attitude of jail staff has not changed. At the same time it also revealed tha repression could not lower the moral of the teachers.

When the teachers started courting mass arrests, they were invited for talks at Chief Minister's residence on September 21, 1978. The dialogue lasted only 10 minutes and failed. Negotiations were again held on November 20, 1978. This time the government agreed to start interviews for *ad hoc* appointments. Secondly, it was also accepted that the headmasters would no longer make appointments. For all such appointments, the selection committee would consist of the DEO, representative of the DC and the District Welfare Officer. But authority to appoint teachers was given to the DEOs, who were allowed to appoint teachers even if no representative of the DC and the District Welfare Officer turned up. The Union, however, decided to boycott such interviews till its other demands were conceded. The Union was successful in getting the interviews completely boycotted and wherever interviews were sought to be held, they had to be cancelled.

The following were the other major demands of the teachers:

(1) Time-bound regularisation by January 15, 1979:

(a) Some teachers had been employed under the half-a-million jobs scheme. The demand was that all those persons who had put in a year's service by 1.1.1973 under this scheme be

regularised.

(b) All teachers who had put in at least one year's service by 31.3.1977 be regularised even though they might have crossed the age limit.

(c) Teachers working on leave and liaison posts and on headmasters posts be regularised.

(d) Nursery teachers be allowed to get admission to the second year of JBT and be regularised.

(2) Teachers who were victimised under the Emergency or in the various phases of the teachers' struggle be granted redressal immediately.

(3) The government should institute a judicial probe into the Patiala jail incident.

(4) New appointments. This has now become the major demand of the Union. According to the existing rules, there is need for 810 DPEs, 1,500 PTIs and 400 art and craft teachers in the various schools. The Union is demanding that these 2,710 posts be filled immediately. The genuineness of this demand is not contested even by the government, but it pleads its inability to concede the demand on account of alleged financial difficulties.

Since the government adopted an attitude of silence towards this struggle it began to be intensified. On November 22, 1978 a mass rally was held at Chandigarh in which about 10,000 persons participated. On November 25 a meeting of various mass organisations was convened in which 25 organisations participated. Various students' organisations became actively involved in the movement. Punjab Students' Union (Randhawa Group) decided that students would also start courting arrest after November 30, 1978.

When the struggle continued both inside and outside the jails, the Chief Minister again invited the leadership of UTU for negotiations on December 4, 1978. This time negotiations were successful. In addition to the two demands already conceded, the government conceded the following demands:

(1) There would be no victimisation of teachers.

(2) All the teachers who had completed one year's service on March 31, 1977 or (in the case of those employed under the half-a-million jobs scheme) on January 1, 1973 would be regularised by January 15, 1979 even though they might have crossed the age limit.

(3) It was accepted that every year about 200 posts of DPEs and PTIs would be created. Government also agreed to create more posts of art and craft teachers in 1979.

(4) All teachers and workers of fraternal organisations would be released unconditionally. Cases instituted against them following the incident in Patiala jail would be withdrawn. The demand for judicial probe into this incident was, however, not accepted The Chief Minister stated that if the teachers were not satisfied with the magisterial enquiry, anoher appropriate enquiry would be ordered.

With these assurances from the government, the leadership of the unemployed teachers announced the withdrawal of the agitation.

The unemployed teachers' movement was the first systematic mass movement launched at the state level in the post-Emergency period. For the first time, a section of unemployed persons has been organised. This has increased the possibility of organisation of other sections of unemployed persons and in future mass pressure may be put on the state to guarantee employment. In this sense, this struggle has a historical value. Another positive point of this struggle is that it has shown a close link and continuity between the student movement and movement of various categories of employees. One may be active as a student and then as an unemployed person and later on as an employed person. In this sense, this movement may contribute to provide the missing link between the student movement and movements of employed persons.

Second, the struggle assumed the form of a militant mass movement. Apart from unemployed and *ad hoc* teachers, the Government Teachers' Union representing more than 70,000 teachers, various Naujawan Sabhas, student unions and various organisations of employees were directly involved in it. A large number of other organisations extended their support to the movement. But unlike the traditional struggles of employees, this became a militant struggle. Various forms of struggle, ranging from demonstrations to dharna, jagrata and gherao, were used. Teachers also successfully got the interviews completely boycotted. Inside the jail, they forced the jail authorities to yield to mass pressure. The Superintendent of the Patiala jail admitted that at one time the teachers had completely paralysed the jail administration. In the whole of struggle, the emphasis was on mass action rather than actions based on a few individuals.

Third, participation by women in the movement is another positive achievement, 85 women teachers along with 17 children courted arrest. Even inside the jail, the women teachers were in the forefront of the struggle.

Lastly, the struggle of unemployed teachers has reflected the unity of the Left. The struggle has shown how such unity can be achieved in action. All shades of the Left from CPI and CPI(M) to different groups of the independent Left participated in the movement.

Since all elements of the Left participated in the struggle, it has also highlighted the sectarian approach of these elements. This movement was led by the independent Left. As a result, the Rana group was not active to the extent it was expected to be. Its attitude was also influenced by the fact that the CPI(M) was extending support to the Akali-Janata coalition in the state and the struggle launched by unemployed teachers was putting the government in an embarrassing position. So the Rana group did not mobilise the people to the extent possible. Instead, it started a whisper campaign against the leadership that while it could struggle, it could not negotiate effectively. The CPI elements were relatively more active to gain ground they had lost. But their participation was also limited. Further, they were more interested in criticising the Rana group. The independent Left, though in leadership of the movement, was itself not free from this weakness. It was also speaking against the Rana group. An extreme situation was observed at the Ambala jail. When CPI(M) Member of Parliament, Bhagat Ram, came to see the teachers in the jail slogans were shouted against him. Pro-CPI(M) elements and independent Left elements, though locked in one jail for the same cause, were not even on speaking terms. Later on the leadership overcame this situation and asked its members not to shout slogans against any one who came to see them in the jail.

The sectarian approach of the various elements of the Left was thus one of the major weaknesses of the movement. It reduced the participation of those elements which were not in the position of leadership. In absence of this sectarian approach, the movement would have become even more widespread.

'Development' for Whom?

(By a Special Correspondent)

IMMEDIATELY after having observed the 'Human Rights Day' with due grandiloquence on December 12, New Delhi accorded a red carpet reception to the dictatorial Prime Minister of Singapore. The fact that a large number of political activists, trade unionists, student leaders, journalists and so on have been rotting in jails in this tiny island republic for about 16 years is apparently as little relevant to our commitment to the lofty ideal of human rights, as is the degraded existence of our own untouchables to the legal-constitutional proclamations of equality of all Indian citizens. Not really surprising, if one remembers that in a class society hypocrisy is an inseparable part of diplomacy and statecraft, sanctified by a Kautilya or a Machiaveli as the case may be.

But what about the classless societies? Marx and Engels of course held that "The Communists disdain to conceal their views and aims. They openly declare that their ends can be attained only by a forcible overthrow of all existing social conditions". They further enjoined on the working class to "vindicate the simple laws of morals and justice, which ought to govern the relations of private individuals, as the rules paramount of the intercourse of nations". It would appear from certain recent indications that at least in relation to diplomacy in the southeast Asian region, the old bearded 19th century ideologues have become outdated, in the reckonings of the Soviet Union and China.

A *Pravda* article on October 20, 1978 characterised the recent trends in the ASEAN countries as "A Realistic Road for Development". It said that "the members of the Association [of South-East Asian Nations] are becoming increasingly aware of the need for mapping out independent ways for development". More recently, on December 16, the *People's Daily*, Peking, implicitly welcomed "the proposal put forth by the Association of the South-East Asian Nations (ASEAN) for making South East Asia a 'zone of peace, freedom and neutrality' "and rebuked Viet Nam for counterposing to this proposal the aims of "genuine independence, peace and neutrality".

Whose 'development' and 'freedom' are *Pravda* and *People's Daily* talking about? Not of the peoples of these country by any means, since all these states are police states under different garbs. Thailand and Indonesia are under military rule with only varying degrees of disguise; the Philippines is under martial law; Malaysia and Singapore are ruled by exceptional laws whose legality is only fictional.

Some 'developments' undoubtedly there are — but for the benefit of the military machine and US/Japanese multinationals only, no doubt with some fringe gains for the local comprador bourgeoisie. This will be seen from the following list of major economic events that took place in these countries during the *second quarter* of 1978.

In Indonesia, the government 'agreed in principle' to an offer by the US government to set up an M 16 rifle factory in the country.

The US Vice-President Mondale told Suharto that the USA was prepared 'to respond' to the Indonesian request for a squadron of 16 re-conditioned A-4 combat support jets. If it goes through, the deal would then be in addition to the Indonesian purchase of a 12-plane squadron of F-5E fighters.

All this is in addition to the $ 42.8 million of military aid programmed for Jakarta under the US budget for fiscal 1979 and $ 2.5 million that is annually spent by the USA for training Indonesian officers and men in the USA itself.

In the economic sphere, the Indonesian Trade Minister announced in May 1978 that henceforth joint ventures with foreign capital would be permitted in department stores, supermarkets and shopping centres in provincial capitals and in silos and warehouses in rural areas

Caltex Pacific Indonesia, P T Semen Cibinong (a joint venture with the Kaiser Cement and Gypsum Corporation), Independent Indonesian-American Oil Co, were all reported to be expanding their operations in Indonesia during the second quarter of 1978.

In May, a syndicate of banks led by the Bank of America granted a $ 24.5 million loan to the Indonesian government for financing the purchase of television and radio broadcasting equipment from the USA.

Besides, the US Government granted loans totalling $ 60 4 million to the Indonesian Government, at varying rates of interest.

In Malaysia, the Goodyear Tire and Rubber, Morgan Guaranty, Wells Fargo Bank, Chemical Bank of the USA, and the ESSO all expanded their operations during the second quarter of 1978. Launching the American Business Council in Kuala Lumpur, the Malaysian Deputy Prime Minister stated that more than 90 projects, either wholly owned by the Americans or their joint ventures with Malaysian participation, had been approved up to March 1978.

In the Philippines, statistics released in late April 1978 showed that American investments amounting to $ 93 million constituted 57 per cent of the total foreign investments approved in 1977. Direct foreign equity investments between February 1970 and December 1977 totalled $ 801 million, of which the US share was 46 per cent.

The Central Bank of the Philippines announced in April 1978 its policy to permit additional investments by foreign banks in the domestic private commercial banks.

The Government permitted in May an additional $ 20 million by the Ford Motor "to support new manufacturing and marketing programmes". Armco Steel Corpn, Houston Oil and Minerals, Pepsicola, Delta Motor, Occidental Petroleum and some other US concerns were permitted to make fresh investments and/or expand their operations in the Philippines.

Besides, Bankers' Trust Co (Mitsui Bank's New York subsidiary), Chemical Bank, Republic National Bank of Dallas, First National Bank of Dallas, Chase Manhattan Asia Ltd, etc, granted loans of varying amounts for different projects during the second quarter of 1978.

In Singapore, International Harvester, Hughes Tools Co of Houston, Corona Manufactures made new investments during the second quarter of 1978.

Caltex joined British Petroleum to launch a joint venture refinery. Morgan Guaranty Trust bought out all the shares of its Singapore subsidiary to make it wholly owned.

In Thailand, during his Bangkok visit in May 1978, the US Vice-President revealed that the USA had agreed to sell Thailand a squadron of 18 Northrop F-5E fighter-bomber planes worth about $ 90 million

In the economic sphere, Firestone Tyre and Rubber (Thailand), in which 55 per cent share is held by the parent US corporation, decided to make a fresh investment of $ 14 million for expansion of production capacity. Pacific Plastics, a subsidiary of the Dow Chemicals, started production in

June [illegible]. Fluor Corpn. of the USA got a $ 300 million contract for the construction of a pipeline. Siam Cement got a $ 50 million loan arranged by the Chemical Bank and Guaranty Trust of the USA.

Neither these facts nor their implications can be unknown to the Soviet Union and China. The truth is that both the countries are wooing these states in the interests of global strategy, and, in doing so, resorting to time-honoured diplomatic rules, even if they — that is, the Soviet Union and China — may have to overcome in the process their Marxist squeamishness over the Kautilyan or Machiavellian origin of these diplomatic rules.

Malcolm Caldwell and Kampuchea

Gail Omvedt

THE death of Marxist scholar-activist Malcolm Caldwell on December 23 in Cambodia (Kampuchea) is a shocking event, not simply because he was deliberately assassinated as the most well known friend of the Cambodian revolution, but because it happened in the context of a war between the two Indochina countries who had triumphed over the most vicious assaults of American imperialism.

Caldwell was the author of several books, including "Cambodia in the South-East Asian War" and most recently "The Wealth of Some Nations" on underdevelopment in the Third World. He edited "Ten Years Military Terror in Indonesia" at the request of the Indonesian communist party, and was an editor of the *Journal of Contemporary Asia* which publishes articles and documents from liberation movements in Asia. He was not simply a writer, but gave generously of his time and energy in speaking and other fund-raising tours to fight imperialism in Asia and the growing racist and fascist movements in Britain itself.

Before his death Malcolm had written a number of articles, which were undoubtedly preparations for a book, on Kampuchea since liberation. He believed that the Kampuchean revolution was the "most maligned revolution in the world". He argued that because the country had been kept so backward by the processes of colonialism, so 'isolated' from any of the benefits of modernisation, so idealised by Westerners as a kind of untouched land of Buddhist repose and the fairyland of Angkor Wat, that the very speed and thoroughness and overwhelming popular support of the revolution when it came was a worse shock than even the defeat in Viet Nam.

Perhaps a really fitting tribute to Malcolm Caldwell then would be a close look at the development of the Kampuchean revolution and the forces which have shaped it. Even if the imperialist-originated depiction of the revolution — as the most barbaric, extremist and despotic regime in history — has no basis in fact, it is important to understand why such stories could be spread and believed.

French imperialism raped and exploited the Indochinese countryside, turning countries like Viet Nam and Cambodia into exporters of rice and maize to Europe while their peasants starved (two million Vietnamese peasants died of famine during World War II) and while cities like Saigon and Phnom Penh flourished as centres of parasitic bureaucrats and traders who lived in their luxurious villas to the very end. "The Great Prostitute on the Mekong" is what the Cambodian peasants called Phnom Penh[1] where the situation was even more extreme than in Viet Nam because the country was kept under 'indirect rule' (through puppet princes) and no industries of any sort had developed.

American imperialism intensified — deliberately — the parasitic and cancerous growth of the cities. The Americans had early recognised the truth of the saying, "the guerilla lives among the people as a fish lives in water". The 'solution' of course is to drain the water, and this — i e, the removal of the people from their land — is what counter-revolutionary warfare has been about from the beginning. The most 'normal' form, of course, is the familiar 'relocated' or 'protected' village, where the people are taken away from their homes and put behind barbed wire in a new environment where the guerillas can have no access to them; whether Kenya and the 'Mau Mau' or Malaysia or Algeria the story is much the same.

In Indochina, though, the American government took a further step: a deliberate attempt to bomb the people out of the land altogether and into the cities. Total US and allied air munitions expended in Indochina were seven million tons, compared to a total of two million tons expended during the *entire* second world war; an additional seven million tons of ground munitions were also expended. An estimated 20 million craters were created by bombing and 20 per cent of the land surface of Indochina is said to have been contaminated by missile fragments.[2] In Cambodia itself, between March and August 1973, 50 per cent *more* American bombs were dropped than on Japan during World War II, though Japan is twice as big in area as Cambodia.[3]

The effect was to swell the already overgrown cities, and by the end of the war the South Vietnamese urban population had grown to 40 per cent of the total while in Cambodia the single city of Phnom Penh grew from 700,000 to three million. The people of the cities generally could find no productive work but lived instead in service and parasitic occupations (including prostitution, which was said to have employed 400,000 women in Saigon by the end of the war, equivalent to the pre-war population of the city) financed by American dollars. And they were fed, not by the agriculture of their own country which had been shattered by imperialism and war, but by imports of American rice under the ironically named PL-480 'Food for Peace' programme.

The entire social structure of these countries was thus warped, and the withdrawal of American money and American rice necessarily meant a grave, if temporary, crisis — resulting in some decline in living standards and a need for some relocation in the countryside. In Viet Nam, which had after all some industrial basis and infrastructure and a socialist economy in the North, the process could be gradual. Even so, thousands of the frustrated urban dwellers — who had had no experience of country living for 15 years and were unwilling to try and who had been given a mirage of America as the land of unlimited wealth — fled in confusion from the new hardships of socialism, to become the so-called 'boat people'.

Cambodia's situation was worse. Phnom Penh, with three million out of seven million people in the country, had — according to US AID officials — only a six-day supply of rice on hand at the time of liberation and the US departure.

In these circumstances, it is not surprising that the Kampuchean communists chose to vacate the parasitic city, the 'great whore', and take its population to the food rather than *vice versa* and, more important, to give them the only productive work available in the present state of country, that of food production.

The evacuation of Phnom Penh and the setting up of agricultural communes

whose exchange was based on a barter system (little indigenous banking infrastructure existed) was what led to the charges of 'massacres', purges, forced labour, and the general depiction of the regime as some kind of incredibly primitive combination of Asiatic despotism and Orwell's totalitarian nightmare. Such picture has almost no basis of reality.[4] The massacre stories were concocted: the last journalists and priests who left the country reported that they "were not witness to any cruelties". There were unverified Thailand pictures of armed soldiers guarding peasants (Thailand at that time was the most anti-communist country in the area) which were used to prove 'atrocities'. A Vietnamese refugee who crossed the country during three months in 1976, speaking the language, working for food in various villages, heard no atrocity stories till he reached Thailand. It is somewhat dreary to go on refuting baseless evidence, particularly when such stories themselves go on being published in widely circulating dailies after their refutation. The main point is that, while there was undoubtedly some 'force' used in evacuating Phnom Penh, this consisted mainly of the population being told that the alternative was to starve in an empty city. The greatest 'atrocity' of the Kampuchean revolution was probably that the middle class and upper middle class people of the great city were made to live and work like the peasants of their own countryside.

But the evacuation of Phnom Penh was not simply an *ad hoc* response to an objective necessity. It was also a revolutionary strategy. As Malcolm Caldwell argued, "the leaders of the Cambodian Revolution had evolved both short-term tactics and a long-term socio-economic strategy, based upon a sound analysis of the realities of the country's society and economy, in the years before liberation... and the chosen course is a sound one whether one judges it in terms of its domestic appositeness or in terms of its reading of the future of the international economy."[5]

This means that there was a deliberate refusal of an alternative strategy which might have been to stay in Phnom Penh, accept the massive imports of food aid from Russia or China that this would have necessitated, maintain a commercial economy, and maintain their country's ties with the international market. Instead, the Kampuchean leaders chose a peasant-oriented self-reliance, an 'autarkic' strategy of development which involved a temporary but total withdrawal from the world market, an intensive effort to build up agriculture in co-ordination with the industries which served agriculture, and only after their base was well established to slowly extend their attempts to industrialise and re-build their world trade links.[6]

"Our objective is to make our country a modern agricultural and industrial nation", said deputy premier Ieng Sary in a UN speech in 1975. Just as everywhere — but the Kampuchean revolutionary leaders were convinced that this involved basing themselves on and rebuilding the country's devastated agriculture rather than going for faster, more glamorous aid and 'development' projects. This leadership was a peculiar combination of peasant and scholar (there being almost no real working class in the country). Many — most of these of peasant background themselves — had degrees from Paris, like president Khieu Samphan, who had a PhD in agrarian economics from the Sorbonne, working with other marxist scholars there at the time like Samir Amin. The conclusion of their youthful Marxist scholarship was that premature integration into an international economy simply perpetuated the mechanisms of underdevelopment · a theoretical expression of the raw experience of the Cambodian peasant who saw his rice and labour drain from the country into the city and from Asia out to Europe.

From 1971, in liberated areas, the Khmer Rouge began organising peasants to construct intensive irrigation works which eventually made possible double and even triple-cropping, while mutual-aid groups and production solidarity groups were developed into agricultural co-operatives. By 1975, in spite of the ferocious bombing, the absorption of an additional three million people had been prepared for — and the first achievement of the Kampuchean revolution was indeed to be able to feed all its people at a growing level of quantity as well as increasing diversity with new methods of growing fruit, vegetables and raising livestock and fish. With this as a basis, the development of small industries and a growing export programme could begin. According to Caldwell writing in April 1978, the regime's economic policies have been a substantial success and recent evidence — including testimony from a visiting Japanese delegation in August — has confirmed the stability of the regime and a well-organised agricultural and small-scale industrial economy. Malcolm Caldwell himself was undoubtedly preparing much more to say on [illegible]

As far as I know, Malcolm had had very little to say publicly on the growing conflict between Kampuchea and Viet Nam by the time of his death. Like most Western anti-imperialists, he was incredibly pained by developments in Indochina and felt that public condemnation of any country was out of place. Indeed, his mood was to focus more on developments in Britain: the growing anti-racist struggle and his favourite cause of Scottish nationalism. But it is hard to know how he could have avoided saying something about the role of Viet Nam: a popular and ultimately rational revolutionary regime does not crumble before mass insurrection, though it may be driven back into the jungles by superior firepower. In the end, Malcolm did go to South East Asia, and his voice has been silenced. And more than ever, huge question marks hang before the future of the revolutions not only in Kampuchea but in Viet Nam and Laos as well.

Notes

[Much of the information here is taken from the draft of Caldwell's most recent paper available to me: "Cambodia Rationale for a Rural Policy", read at the Seminar on Underdevelopment and Subsistence Reproduction in Southeast Asia at Bielefeld, West Germany April 21-23, 1978. Also see George Hildebrand and Gareth Porter, "Cambodia Starvation and Revolution", New York Monthly Review Press, 1976. Transnational Corporations in Electrical Industry

TRANSNATIONAL CORPORATIONS (TNCs) are producing an ever greater share of the world's output of electrical goods. They also account for a very large share of the international trade in such goods, much of which is on an inter-firm basis. A study prepared at the request of the UNCTAD Secretariat by Richard S Newfarmer examines how the behaviour of TNCs in the electrical industry affects the development and trade of developing countries. ("The International Market Power of Transnational Corporations: A Case Study of the Electrical Industry" by Richard S Newfarmer; UNCTAD/ST/MD/13.) Excerpts from the summary and conclusions of the study are reproduced below.

The general objective of this study has been to show how electrical transnational conglomerates mobilise and use economic power in international and foreign markets and to understand its effects upon developing countries. In particular, it has focused attention on formal and informal interdependent behaviour whereby concerted market tactics and uneasy oligopolistic equilibriums replace vigorous price competition in many markets.

International Organisation of the Industry

The electrical industry encompasses a great variety of capital and consumer goods. Capital goods include equipment for the generation, transmission and distribution of electricity, as well as motors to drive machinery. Consumer products range from familiar household appliances to the newest electronic products.

The leading firms usually produce the full range of these diverse products. The companies are huge by any standards, and their sales and production activities straddle the globe. Because they produce in dozens of national markets, they can be termed transnational conglomerates.

The salient characteristic of the international electrical industry is its concentration. Although exact measurement is not possible, it is safe to conclude that the leading score of major TNCs generate the bulk of the industry's sales and control much of its advanced and patented technology. The leading diversified firms meet each other in many national and product markets. Mergers and acquisitions, often encouraged by home governments wanting to restructure home industries, have accelerated concentration within the industry. Besides their multiple contact points in many markets, the electrical TNCs have several extra-market ties. These take the form of equity holdings of each other's stock, joint ventures around the world, licensing arrangements to share the industry's most advanced technology, and consortia and cartels.

Historical Forms of Rivalry and Interdependence

Foreign markets attracted the attention of the dominant firms very early in the development of the industry. After a brief period of expansive foreign investment and trade activity lasting roughly from 1880 to 1900, enterprises began to appreciate the advantages of restraining international competition. From about 1900 to 1930, the world's major firms relied increasingly on restrictive clauses in cross-licences of patented technology for the purpose of dividing up the world market into territories among themselves. The companies attempted to impede the flow of technology and industry to non-producing areas in order to preserve their shared world monopoly.

When the Great Depression came and demand weakened, frantic competition for export markets could only be curtailed by formal international cartels. Major firms entered into "notification and compensation" agreements that successfully cartelised much of the industry's world trade. The cartels included most of the world's dominant firms and lasted at full strength well into the 1940s.

Pre-1945 Restrictive Practices

The market allocation arrangements through licences and cartels after 1900 retarded development in many of the non-producing countries up to the early 1940s. The restrictive provisions of the cross-licensing contracts among the industry's majors raised barriers to entry that were virtually insurmountable to outside firms, including domestic firms in developing countries. First, even if entrepreneurs in developing countries had had favourable economic conditions and a comparative advantage in production, they would have had great difficulty in obtaining the necessary technology. The companies wanted to prevent the growth of independent firms in the non-producing countries which were their export markets. Agreements restricted the diffusion of technology and manufacturing operations. Furthermore, the agreements ensured that exports would not disturb their home markets — including possible future exports from developing countries. Second, if domestic firms in developing countries had been able to obtain the technology through licences, they would still have experienced an absolute cost advantage (*ceteris paribus*) by an amount equal to their royalty payments.

Third, even large firms in developed countries using licences of others were prevented from using the group's technology to begin manufacturing in most of the developing world. In the case of the AEG and GE cross-licences, for example, only when markets were cut off by trade restrictions during the Depression and the Second World War did these two companies permit each other to begin manufacturing in developing countries under their respective patents. Effectively, there appeared to be a tacit recognition that developing countries should remain importers from the industrialised world.

It is clear that the dominant firms wanted to impede the spread of technology to the non-producing countries to preserve their shared monopolies. Consequently, growth in the domestic electrical industry often lagged behind most other domestic manufacturing industries in developing countries by 1930 and even in the 1940s.

Besides implanting an industrial organisation that set the stage for post-1945 control of foreign markets by TNCs, the early restrictive practices allowed these corporations to receive the bulk of historical gains from trade. Territorial divisions of world markets reduced competition and undoubtedly resulted in above normal profits. Collusive pricing for cables, lamps and heavy equipments had the same effects. The absence of vigorous price competition transferred income from consuming groups in developing countries to the owners of capital and their managers. In other words, the concentrated structure of international production and concomitant restrictive practices served to shift investible surplus from the developing periphery to the industrialised centre.

Era of Transnational Conglomerates

In the late 1940s and early 1950s, the major TNCs of the electrical industry invested heavily in the developing countries, following the course of other oligopolistic, technology-intensive industries. Much of this investment was made defensively to maintain a share of markets newly protected by tariffs. Manufacturing abroad replaced trade in some final products. Thus the organisation of the post-war industry soon came to revolve around production units in several countries under the centralised direction of a score of industrial giants. Parents often supplied subsidiaries with intermediate products to be manufactured into final products locally as well as with the latest final products from home to be sold locally. Foreign investment became "the handmaiden of trade".

Strategies of Transnational Corporations

Trade expanded rapidly after 1945, *pari passu* with foreign investment. An increasing proportion of exports from developed to developing countries, however, consisted of sales by

A close look at your mirror would explain why Triveni Sheet Glass has acquired its present standing.

If the glass for your mirror is manufactured by Triveni Sheet Glass, you can be sure every square metre is checked and not an air bubble escapes the eye.

The reason is quite simple. Triveni Sheet Glass is probably the only company that checks every square metre of glass before it leaves the factory. Because a single wave, stone or air bubble makes all the difference to clarity and finish. That's why 'selection' at Triveni is not just a matter of routine, but as complex as maintaining the required furnace temperature.

Just two years after inception Triveni Sheet Glass is second to none in quality, and one of the largest in sales.

Its new symbol signifies everything it is today—outstanding, far-seeing and progressive.

A company founded on expert skill and sound knowledge. Managed by professionals and guided by some of the finest glass technologists in the country.

A company that is one of the largest exporters of quality sheet glass today, only because Triveni glass meets the stringent requirements of mirror manufacturers in various countries of the world. And finally, a company that believes competence is not merely a matter of time. But of purpose and achievement.

> Triveni sheet glass is used:
>
> For mirrors—the finest mirrors depend on Triveni's 'selected' glass for undistorted reflection.
>
> In laminated and toughened glass—for automobiles, railway coaches and factories.
>
> For glazing—in doors, windows and furniture etc.

Triveni Sheet Glass: The house of glass with a foundation of steel.

parent TNCs to their world network of subsidiaries. By 1970, about 20 per cent of electrical exports from the United States were intrafirm transactions of TNCs. As a result, corporate planners enjoyed considerable flexibility in transferring profits around the world through non-market prices. A second change in the organisation of world trade in electrical products was the importance of the growing markets of the developing countries. Nearly one-quarter of electrical exports from home countries went to developing countries by 1973.

Competition in exports to developing countries continues to be characterised by varying forms of interdependence among the major TNCs. Despite a more hostile legal environment for cartels, the home countries' tolerance continues to permit the cartelisation of exports. Electrical export cartels are officially registered in industrialised countries such as the Federal Republic of Germany, Japan and the United Kingdom. Many of those registered European cartels are international in scope and appear to be closely tied to the International Electrical Association (IEA).

Although secrecy surrounds most cartel arrangements, reports and cartel contracts of the IEA reveal extensive collusion in at least nine major product groups of the heavy equipment industry and include at least 37 producers. The cartel is organised into "Product Sections", including Steam Turbines to Drive Generators (Section A), Steam Turbine Driven Alternators (Section B), Water Turbine Driven AC Generators (Section E), Synchronous Condensers (Section F), Circuit Breakers (Section G), Transformers (Section H), Rectifiers (Section K), Rolling Mill Equipment (Section P) and Water Turbines (Section W). The most common provision is a notification clause. Under this clause producers agree to notify each other through the Secretary upon learning of a tender, so that the prospective bidders may collectively set prices and determine which producer will submit the lowest bid. In addition, five of nine agreements contain provisions setting common minimum prices or reference prices. Three agreements contain provisions for the pooling of profits among cartel members. Three contain formal allocation procedures and quotas for the apportionment of bids.

Other cartels covering electrical products exist outside the IEA. The most notable are the electrical cable cartel, called the International Cable Development Corporation (ICDC), and the telephone cable cartel, called the International Telephone Cable Association. Reports on these industries indicate that the cartels set prices, allocate markets, and set quotas for members as well as engage in predatory practices against outsiders. One of the most recent developments appears to be the collective review and approval of new investments in foreign countries undertaken in the ICDC. In this case at least the export cartel plays the part of an "investment cartel".

Explicit forms of market regulation often are combined with informal understandings. Trade patterns show definite spheres of influence, especially evident in the case of cables and transformers. These understandings eliminate any chances of effective competition in the international market and replace it with a virtually shared world monopoly.

Economic Consequences for Developing Regions

From the viewpoint of developing countries, market co-ordination tactics are perhaps more harmful because they are most prevalent in products crucial to industrialisation the heavy equipment side of the industry. Allowing for intrafirm trade, international and national export cartels, and informal concerted behaviour, it is estimated conservatively that at least 35-40 per cent of the international trade in electrical products with developing countries is subject to some form of market power exerted by TNCs.

This market power and trade restrictions affect industrialisation in developing countries through both prices and the national economic structure. Competition-restricting behaviour permits TNCs to raise prices of exports above competitive price levels. Prices of imports into developing countries therefore exceed those that would be charged in the absence of the restrictive practices.

The structural consequences of formal and informal market agreements are perhaps more deleterious to developing economies than the short-run consequences of higher prices. As did the early cross-licences of technology, today's cartels raise barriers to the entry of outsiders in particular markets. They are especially effective against domestically-owned firms in developing countries. The financial base of domestic firms is far smaller than that of cartel members, and because they are less diversified they cannot cross-subsidise losses for prolonged periods. Moreover, cartels often stifle entry by providing for predatory practices against outsiders. Clauses containing rules for predation were reported in the transformer agreement of the IEA, in the cable agreements in the ICDC, and in the local cartel in Brazil. Finally, notification, compensation and allocation of bids among cartel members give them a competitive advantage over non-members.

Besides making formal and informal agreements, leading TNCs protect their spheres of influence when necessary with aggressive price-cutting. If the threat of potential entry is ever present, leaders may price their goods below the entry-inducing level, but as high above marginal costs as possible. If the threat is especially severe, pricing tactics may include selling below cost for short periods. Their subsidiaries may use the same tactics in overseas markets. The overall effect is to delay or to prevent the entry of domestically-owned firms in developing countries into the market for electrical products. In these ways, restrictive practices stunt the growth of an independent, nationally controlled industry in developing countries.

Foreign Investment and International Market Power

The expansion of world trade has been accompanied by a dramatic increase in local production, giving TNCs access to local markets with varying forms of direct control. This study reviewed briefly four related aspects of internatonal market power associated with the foreign investment process: creation of spheres of influence, takeovers of local firms, the impact of concentration and product differentiation upon the profits of firms, and the consequences of denationalisation for vertical integration and exports.

Creation of spheres of influence. Spheres of influence in the markets in which transnational corporations make investments are the logical extension of market allocation arrangements governing trade. The product cycle usually links exports to foreign investment as transnational corporations begin to manufacture locally products they had formerly exported to the domestic market. Consequently, their restrictions on international trade, particularly formal market allocation arrangements, are likely to influence the decision on where to invest.

The few data that exist are consistent with this interpretation, though they do not exclude other explanations. The interdependent electrical major firms have established only tentative beachheads in each other's traditional home territories, and have not expanded aggressively. (The most recent exception is the Japanese entry into the overseas markets for consumer electronics.) In the developing world, United States electrical firms have established an above-average number of their subsidiaries in their traditional spheres, while Western European firms have done the same in their own territories. In the cable cartel, members have reportedly gone so far as to decide which countries are to become cable producers through their foreign investment, and where they would permit new capacity to be installed.

By recognising spheres of operation the transnational corporations are able to export the oligopolistic structure of their home markets to markets overseas. By formally or informally limiting entry into certain overseas areas, transnational conglomerates can reduce the number of competitors in specific markets, maintaining high levels of concentration that would be reduced in the absence of investment forbearance. This forbearance reduces the number of potential entrants into a market, usually the most powerful being excluded. As a consequence, existing producers are able to raise prices to approach shared monopoly levels with less fear of provoking new entry. Mutual invest-

ment forbearance should be added to the list of market-distorting factors that explain why transnational corporations tend to recreate the same concentrated market structures in developing countries that are found in the home countries.

Takeovers and denationalisation in developing countries. Related to the decision where to invest is the decision how to invest, whether by acquisition or by building a new plant. Acquisitions by TNCs in developing countries increasingly are reorganising the ownership of social resources in the electrical industry. This is especially true as development advances and domestic firms come into the market. In Latin America, for example, 42 per cent of United States electrical transnational corporations established their subsidiary operations by acquiring existing domestic firms in the 1958-1968 period. In Mexico, 60 per cent of the United States electrical TNCs established their operations through takeovers. In Brazil, takeovers accounted for nearly all the substantial increase in the foreign share of Brazil's electrical industry in the 1960-74 period. Moreover, a few of the largest takeovers in Brazil had considerable anti-competitive effects. These examples can probably be paralleled in other developing countries at similar stages of development.

Concentration and product differentiation. Once TNCs have established operations in the protected markets of developing countries, they often capture a large market share and advertise heavily to create an image for their trademarked products. The power of TNCs to extract above-normal profits is closely related to the level of concentration and industry advertising. Evidence for developing countries such as Pakistan, Mexico and Brazil shows that the higher the level of market concentration, the higher are a firm's profits, other things being equal. Product differentiation through industrial advertising is also a powerful factor in raising rates of return. Data for Brazil's electrical industry by itself demonstrate that as the degree of concentration and product differentiation rises so do profits generally increase.

Industrial performance in developing areas is adversely affected by the same distortions that market power commonly carries in any market economy. Market power reduces the efficiency of the economy by distorting the allocative function of the price mechanism. Moreover, market power shifts income from consumers to managers and stockholders of firms, usually concentrating income. Also, administered prices appear to exacerbate inflation, especially cost-push inflation.

When high market concentration and product differentiation are associated with high denationalisation (or foreign control), market power leads to an additional distortion in industrial performance. Producers who receive the above-competitive levels of earnings are foreign-based and the flow of domestic resources come under their control. If TNCs remit earnings abroad, then market distortions consume valuable foreign exchange. On the other hand, if TNCs reinvest their profits, they strengthen their position in the market. Increased denationalisation has consequences for industrial performance because foreign firms may behave differently from domestic firms.

Vertical integration and exports. One area in which foreign firms behave differently from domestic firms appears to be that of vertical integration. Electrical transnational corporations generally have less economic incentive to integrate forward or backward than do domestic firms.

The case of the copper exporting countries appears to bear out the view that the internationally integrated foreign-owned industry has no incentive to establish a domestic industry making cables for export. None of the four major copper exporters — Chile, Peru, Zaire or Zambia — has developed cable industries, in spite of their privileged access to the chief raw material. In fact, the four are all net cable importers. Forward vertical integration from refined copper to cables has not proceeded.

Another form of local vertical integration, in this case backward, is import substitution. Data for Mexico and Brazil show that transnational corporations generally have a lower ratio of value added to sales than domestic firms in the industry. Likewise, subsidiaries of TNCs in Peru and Brazil have a much higher ratio of imports to total sales than have domestic firms. As transnational corporations strive to maintain open access to markets of developing countries, foreign investment is a vital means of increasing the home country's exports along with local sales.

Foreign ownership and international market power may affect export behaviour as well. First, an increasing portion of sales by subsidiaries of TNCs abroad are made to subsidiaries of the same parent organisation. As a result, host countries are vulnerable to abusive transfer pricing. Companies may under-price exported components in order to accumulate earnings in the home countries, diminishing the foreign exchange earnings of the host country.

Second, "export platforms" or "offshore assembly operations" may be only a temporary blessing — vulnerable to the move of a pin on the world map of a home office planner when wages rise. More importantly offshore assembly operations benefit only a few countries and do not augur well for increases in electrical exports for the vast majority of developing countries.

Finally foreign ownership may influence the direction of the exports of subsidiaries. Although evidence is not abundant on this point, it is arguable that parents may steer a subsidiary's sales abroad away from their own markets and in some cases away from markets of their principal rivals to avoid unleashing competition.

Enlightening Case of Lamps

The lamp industry illustrates how a handful of producers use trade and foreign investment to control the world market in one product group. The lamp business set the initial pattern of interdependent behaviour among large electrical firms, beginning with the early Phoebus cartel in 1924. The upheavals of the early 1940s brought to an end its complex system of international planning and market regulation. It appears to have been replaced with an informal and perhaps less stable equilibrium among producers.

After the demise of the lamp cartel, market concentration increased and new price competition did not ensue in many of the developed countries. Data for the United States, Britain, France, the Federal Republic of Germany and other EEC countries indicate that the leading lamp manufacturers have established dominant positions in these markets. Moreover, considerable price rigidity and parallel pricing was evident in the 1950s and 1960s in markets of the EEC countries. Because of the defined areas of production established by producers in the EEC, price discrimination is still evident, despite the absence of tariffs. Besides the informal consensus of forbearance, quantity and loyalty rebates bind purchasers to domestic suppliers. These are often agreed upon in manufacturers' associations. They also make it difficult, if not impossible, for independent lamp producers in developing countries to capture market shares in the developed countries.

Foreign direct investment has been an important element of market control in the lamp industry. General Electric, Osram, Philips and GEC are responsible for the great majority of foreign investment in lamps. While Latin America remains the principal territory of General Electric, Osram and Philips, GEC holds a privileged position in Commonwealth (or former Commonwealth) countries.

Joint ventures and other co-ordinated production and pricing strategies in developing countries raise returns to transnational corporations. Evidence from India and Brazil indicates that producers use joint ventures and manufacturing associations in order to control output and prices. In the case of India, agreements among the principal suppliers effectively tied purchases of imports to certain producers, undoubtedly raising their cost to India. At the same time, Indian subsidiaries were debarred from exporting to the main industrialised markets of the world. Thus, in the case of lamps, foreign investment and trade activities have buttressed the control of the world market held by the international lamp oligopoly, and not threatened it.

Unsuccessful Transplant

N S Jodha

Report of the Review Committee on Agricultural Universities, Indian Council of Agricultural Research, New Delhi, June 1978; pp 319 + A-100.

THE state of the Agricultural University Movement (AUM), started in India about two decades ago on the pattern of the American Land Grant College System, once again demonstrates the limits of cross-country transferability of institutional technology.

Following the recommendations of two Joint Indo-American Teams on Agricultural Research and Education (1954-55 and 1959-60), the first agricultural university (AU) on the land grant college pattern was set up at pantnagar in 1960. The number of such universities increased to 8 by 1966, 21 by 1976 and 23 by 1978. Though at different stages of development, in 1975-76, the agricultural universities had 443 research stations, then controlled 46,000 acres of farm area and handled over 1,650 research projects. They had more than 6,000 faculty members and they produced 5,000 graduates and over 1,300 post-graduates in agricultural sciences in 1975-76. Some of them had been the leading partners in generating the HYV-based new technology. However, it was realised that despite its rapid expansion, the AUM, in terms of standards and capabilities, has not spread uniformly through out the country. Most of the AUs were found to be wanting in terms of serving the needs of changing agriculture. This necessitated a critical assessment of the growth and development of AUs. The document under review is the report of the Review Committee on AUs set up under the chairmanship of M S Randhawa in January 1977.

The report is easily one of the best reference documents on agricultural education and research in India. At places, it (unlike several official reports) is quite frank in its presentation. Of course, a number of the issues highlighted and the suggestions offered by the Committee had already figured in one or the other forums, but the Committee has synthesised and formalised them. Depending upon the circumstances, this may help keen individuals to push for some changes. The two key issues which need detailed comment are: the nature of the factors involved in growth of AUM in India and the capability of AUs to produce scientist farmers.

Agricultural University Movement

The committee examines the performance of agricultural universities with reference to ICAR's Model Act (1966) which was designed to guide the setting up and working of AUs. The Model Act embodied the key features of the Land Grant College System (e g, integrated conduct of agricultural research, education and extension as a sole responsibility of the AU; provision of land for commercial production to ensure self-reliance for the AUs, etc). The Model Act besides suggesting one AU for each state provide detailed guidelines for governance of AUs.

However, despite the Model Act and repeated reminders by ICAR, several states have deviated from the provisions of the Model Act. For instance, in place of having one university per state, states like Uttar Pradesh and Maharashtra have three and four AUs, respectively. Nine AUs have three or more campuses. Further, this multiplication is not necessarily guided by agro-climatic considerations. In place of establishing fulfledged, exclusive AUs, states like Rajasthan and Himachal Pradesh (and till recently West Bengal) have only agricultural complexes as parts of general universities.

While in principle all states have accepted the philosophy of integration of research, teaching and extension functions under AUs, in practice most of them have resisted the transfer of research and extension functions to AUs. They plead that their AUs are yet immature to handle these responsibilities. Interestingly, they also use the National Commission on Agriculture's recommendation favouring adaptive research (field verification, trials, and tests) to be a function of state departments of agriculture as an excuse for non-transfer of research responsibilities to AUs. Consequently, states like Tamil Nadu even after transferring the research function to AU, retains 12 out of 14 research facilities at districts. The Rajasthan government took 10 years to transfer the research function to the Udaipur University and yet managed to keep an important research set-up in irrigation command areas. Madhya Pradesh shifted all research activity to AU, but has recently started its own Rice Research Institute at Raipur.

Higher agricultural education is transferred to AUs in all states except in Uttar Pradesh, where a number of agricultural colleges run like arts colleges still continue. Transfer of extension education responsibility is also incomplete in most states. While Punjab and Haryana have given a larger role to the AUs in extension, other states have only a marginal input of AUs in agri cultural extension. Kerala illustrates an extreme case where the university has practically no role in field extension. University scientists do not have freedom and facilities even to conduct front-line demonstrations in the farmers' fields. The place of extension in the present set up of AUs is indicated by its very low share (6 per cent) in the current budget of all AUs put together.

In the matter of governance of AUs and curricula, etc, there is only partial adherence to the Model Act. While most of the rather 'harmless' activities are conducted as per the Model Act, in the case of provisions having implication in terms of controlling power, etc, the model is seriously violated. The provisions governing composition of management boards, selection committees and procedures for choosing vice-chancellors and other senior staff members, etc, fall in the latter category.

A key point to be noted is that most deviations from the Model Act fall in a clear cut pattern and exhibit the state governments' lack of full understanding of the functional requirements of agricultural research, education and extension in the respective states. Most of the state governments seem to treat AUs hardly different from Centrally sponsored projects to be located in their respective territories. They are used both as a mechanism of *effecting transfer* of Central funds to the state and as a means to patronise regional groups within the state by way of setting up multiple AUs and their campuses. Their resistance to transfer of research and *extension to AUs as well as manipulation* of procedures for selection of senior personnel to run AUs, again in a way reflect their tendency to use AUs too as instrument for strengthening established interest groups, including *the bureaucracy of the agricultural departments.*

On the basis of experience of successful universities (e g, Punjab Agricultural University) the Review Committee has described 'state support' as the critical factor in the success of the AUs. The 'state support' in real terms means willingness of states to do away with the aforesaid considerations while promoting and running the AUs. The Committee's key recommendation for effecting 'state support' or enforcing their adherence to the Model Act is for using ICAR funding for AUs as a control mechanism.

However, a glance at the past history and the current situation would seriously discount the role of ICAR grants as a 'control mechanism' to compel change in the approach of states towards AUM. In fact ICAR has always insisted on some extent of matching contribution of states in developing AUs However, after every review of slow progress of different AUs, ICAR has to raise its share. The ICAR expenditure on AUs has increased from Rs 1.20 crores during the Second Five-Year Plan to Rs 29.23 crores during the four years of the Fifth Plan, both because of increase in number as well as increased dependence of AUs on ICAR In about half of the AUs, ICAR grants have constituted more than a third of their total expenditure since their respective inceptions.

The implication is clear. Financial strictness on the part of ICAR will only add to the slowing down of AUM, as most of the states, for reasons stated above, will not bother to develop their AUs unless the latter continue to serve as resource transfer mechanisms from the Centre. Further, to carry out its national research responsibility through All-India Co-ordinated Projects and multilocation trials of farm technology, the ICAR has no choice but to develop research capabilities and infrastructure in different states.

Moreover, in the Indian context, state support to AUs ultimately depends upon the convergence of interests of the powerful (and enlightened) peasantry and the political leadership of the state as revealed by the situation in Punjab, Haryana and western Uttar Pradesh The said convergence of interest of course is a product of circumstance replication of which falls far beyond the capacity of a technical institution like ICAR.

Besides, as long as the benefits of a successful AU are freely available to other states in the same agro-climatic zone, the latter would have little technical (as against political) compulsion to strengthen own AUs. For instance, as the green revolution in the wheat growing tracts of Rajasthan could spread because of the work of AUs at Ludhiana and Pantnagar, the state could easily afford to ignore its own AU. Taken to its logical conclusion, this reasoning means a provision of a good AU for each agro-climatic/crop zone rather than for each state. But if accepted, this logic in retrospect tends to discount the value of an important provision of Model Act which suggested one AU for each state and in the process undermined the agro-climatic oriented functional basis of AUM.

'Non-elite Graduates'

One of the most important points in the terms of reference of the Review Committee related to the assessment of the performance of AUs in the training of 'non-elite' (i e, who are not after white collar jobs) graduates with motivation for self-employment in agriculture, with competence to identify and resolve practical problems by working on farms and thereby offer practical leadership to the farmers. The Committee made a detailed study of factors affecting technical competence and skill of the agricultural graduates and also the circumstances related to motivation for their self-employment in agriculture.

The Committee, after analysing the composition of courses at AUs, observes that the whole course of work at graduate level is heavily weighted towards theory course because for purposes of admission to post-graduate courses and employment, the overall grade point is the main criterion Furthermore, the practical field training, including through the often publicised 'Earn While-You-Learn' schemes, at AUs is fairly inadequate and is surrounded by a high degree of unreality and so fails to equip the graduates to handle-practical situations encountered by the farmers. The Committee has given a long list of suggestions to improve the situation, which amounts to changing the whole orientation of agricultural education

While discussing the 'motivation' for stopping the drift of agricultural graduates towards white collar jobs as against direct involvement in management of of agricultural land and livestock, the Committee presents some statistics. Accordingly, 95 per cent of employed agricultural graduates (post-graduates included) have employment with government or government supported organisations. Self-employment in agriculture is negligible The Committee lists the high cost of scientific farming, the risk inherent in agriculture and inadequate as well as irregular income from it as important factors preventing agricultural graduates from seeking self-employment in agriculture. Viewed differently, this observation reflects poorly on modern technology based farming, for it fails to impress and convince even those who are supposed to understand it best.

The Committee suggests broadly three solutions.

(i) High priority to rural students, who could be motivated to go back to their own farms after graduation, in admissions in AUs. But this ignores the apparent realities. In practice it is hard to find rural families who educate their children up to graduate level to bring them back to their farms. Nor do such graduates relish the idea of going back to the villages.

(ii) Incentive to agricultural graduates through allotment of irrigated lands and other material and financial support on concessional rates for settling on land as self employed. Apart from the very high cost involved (according to an old estimate quoted by the Committee, cost of such self-employment will be around Rs 75,000 per person). such arrangement will place these graduate farmers in a rather artificial situation and will isolate them in every sense from the rest of the farmers to whom they are supposed to offer technical leadership.

(iii) Encouragement and preference to agricultural graduates in the matter of establishing agricultural support services such as soil testing laboratories, agro-service centres, etc. This may surely open more self-employment opportunities for agricultural graduates and can indirectly serve agriculture in several ways. But the key function of practical farm leadership mentioned earlier will remain unfulfilled.

Perhaps we are trying to be deliberately unrealistic while expecting the 'farm leadership role' from agricultural graduates. Like bare-foot doctors one could think of a cadre of practising farmers who, given extensive exposure to scientific farming, can guide the rest of the farmers in handling the practical problems of modern agriculture. The

Committee's emphasis on farmers' training (ch IV), rather than their lengthy discussion on ways and means to motivate agricultural graduates to settle on farms, seems to answer the question better.

Equally unrealistic seems our emphasis on home science colleges to generate a cadre of scientists who could broaden the horizon of rural women folk and offer them guidance for betterment of rural homes. The Committee rightly observes that "the graduates coming out of home science colleges do not have the orientation, the aptitude or the opportunity to serve rural areas and most of them settle down as housewives in urban areas". Besides providing detailed suggestions for imparting rural orientation to home science education and for its linking with agricultural extension, the Committee (once again ignoring the realities) calls for priority to rural girls for admissions to home science colleges and for motivating them to guide rural women.

REVIEWS

Who Migrate and Why

P B Mayer

Migration from Rural Areas: The Evidence from Village Studies by John Connell, Biplab Dasgupta, Roy Laishley and Michael Lipton; Oxford University Press, Delhi, 1976; pp vii + 228, Rs 40.

IT is perhaps too early to speak of the number of studies of the social consequences of migration which have appeared recently as constituting part of an emerging academic trend. Trend or no, it can already be regretted that so many of these studies are disappointingly naive, especially from the standpoint of political economy. It is a pleasure, therefore, to consider here a work which, within its limits, is methodologically sound, sophisticated in its conception of the problem and something of a model of scholarly economy.

At the core of this work is a search for the answers to two related questions: who are the migrants who leave the villages of the Third World? And which are the factors, social, economic and demographic, which best explain why some villages have many more migrants than others? In the first seven chapters of the book, the authors, utilising the large collection of existing village surveys held by the Village Studies Programme at Sussex University, examine the evidence from the South Pacific, Asia, Africa and Latin America. The richness and variety of these data indicate the extraordinarily complex nature of the phenomena which are subsumed under the label 'migration'.

In their very careful review of the published literature the authors consider the impact on the propensity to migrate of such factors as age, sex, family size, education and the choice of destination. They consider in a similar way such consequences of migration as the impact of remittances, the causes and consequences of returning to the village, and the changes produced as villages which experience a persistent outflow of workers.

In my view, though, the most valuable sections of "Migration from Rural Areas" are those which deal with economic factors which condition migration. In an early chapter, the authors consider the familiar models which describe migrants as rational 'economic men' who move in response to 'felicific' calculations of maximum gains. They conclude that even models of modest complexity, such as that of M Podaro which suggests that migration is essentially conditioned by the differences in income between regions mediated by the probability of securing urban employment, fail to get to the fundamental causes of migration.

In seeking to specify those causes, the authors utilise village level data gathered by the Agro-Economic Research Centres at Sardar Patel University, Delhi and Madras. It is this analysis which, though not entirely free from methodological problems, provides the volume's most significant contribution. Using discriminant analysis, villages with high rates of migration were first separated from those with low rates. Then some 47 variables were utilised to see which best predicted migration. Among the initial results of these tests were the findings that migration was unrelated to basic demographic factors, patterns of occupation, land distribution, or education. It was however related to variables which sought to measure agrarian prosperity. Using these results, a number of multiple correlation models were constructed. "Village-based" variables measuring agricultural labour, inequality in land holdings, land scarcity, crop yield and literacy were found to predict nearly 70 per cent of total migration. "Urban-related" factors measuring the importance of cash rops, and integration into urban markets predicted over 75 per cent of total migration. These are very strong correlations and indicate the extent to which migration is related both to social inequality and the degree to which villages are integrated into the market economy. But as the authors point out, as in much else, there is one migration for the poor and another for the rich.

> Migration is indeed the child of inequality. It is from the village where land is most unequally distributed that migration rates are highest, though it is both the rather poor and the rather rich who migrate, rather than, in general, the very poorest, the middle, or the very richest. Migration, however, is also the father of inequality. It confers cumulative gains upon the richer migrant's family, including access to further probable migration: for the poorer migrant, migration is inceasingly a wandering search for work, and even if the search succeeds it is unlikely to do more for his family than prevent a decline into even deeper poverty. (p 197)

In general, they argue that it is the poor who are 'pushed' and well-to-do who are 'pulled', "yet, throughout, intra-village inequality, especially of landholding, seems the most important single variable, underlying both 'push' and 'pull'" (p 199).

Books in Brief

Indo-US Relations, 1947-1976, by S C Tewari; Radiant Publishers, New Delhi, 1977; pp 179, Rs 45.

THE book under review was originally prepared as a doctoral dissertation. The author has performed a useful service to young scholars and general public by writing a history of the entire range of Indo-American relations. Beginning with an explanation of some obvious differences between the foreign policies of India and the United States, Tewari talks about Kashmir and the US military aid to Pakistan, Indo-American differences over military alliances, Indo-US

disagreements over some selected world issues, the Bangladesh episode and the Indo-American economic relations.

Tewari's work is well-decumented and well-furnished with statistical information on foreign aid and related matters. The book, however, suffers from two major weaknesses. First, it covers too many topics to offer a comprehensive analysis of some of the key issues between India and the United States. In covering almost every aspect through the period 1947-76, the author could not but offer a very sketchy account of Indo-US relations. The second, and the basic, weakness of the book lies in the author's inability to dig below the surface to look for some serious and fundamental difficulties in India's relations with the United States. The problems between India and the US are not just minor misunderstandings between the world's two "peace-loving" and "largest democracies" committed to "democratic principles and the freedom of the individual" (even Nixon has publicly admitted that the US bases its policy on the foreign policies of other nations, not on their domestic policies, acknowledging that America cares little about democracy in other countries).

As Baldev Raj Nayar has shown in his "American Geopolitics and India", the United States has followed a policy of "satellisation" or "containment" of regional powers like India, regardless of their ideological affiliations. Being the world's only global power, the US has tried to prevent the growth of autonomous centres of power in every region of the world. India's desire to emerge as an autonomous centre of power in Asia has been unacceptable to the United States. Why then, one may ask, has the US provided billions of dollars in aid to India? The answer is simple: it is a lever or instrument for the policy of satellisation. As India refuses to fall in line, the US adopts a policy of maintaining a regional balance by enhancing the military capabilities of Pakistan so as to contain India and prevent its emergence as a dominant regional power. This explains why the Soviet Union is sympathetic to India's developmental strategy while the US is not, millions of aid notwithstanding. Every US Administration has followed the twin objectives of satellisation and containment of India — Kennedy did it in a polished manner, Nixon did it bluntly and nakedly. This is why the US was furious over India's intervention in East Pakistan in 1971. By its bold and decisive intervention, India sought to destory not just Pakistan's eastern flank, but the US policy of regional balance as well. Tewari suggests that there was a change, even though short-lived, in the Nixon Administration's South Asia policy in the wake of Bangladesh. As a matter of fact, a close scrutiny of Nixon's statements suggests that there was no basic change in policy, just a change in words. The Ford Administration resumed military aid to Pakistan in continuation of the balancing game. The Carter Administration has begun the pursuit of satellisation and containment by a resumption of modest economic aid to India while pressurising it against the nuclear option.

— L P Singh

Soviet Agriculture : Trials and Triumphs; by G D Sane, Popular Prakashan, Bombay, 1976, pp 182, Rs 32.

BEYOND obtaining more recent information on such subjects as agricultural production, investments, levels of living, etc, the reader is unlikely to profit much from Sane's book on Soviet agriculture. It is neither scholarly nor objective. It is a plain and simple panegyric. For Sane Soviet agricultural progress is 'tremendous' and the rise in the standard of life 'astounding' (p vi), although on his own admission later (p 146) many capitalist countries have done at least equally well. He shows that Soviet agricultural growth in recent years is higher than that of the USA (p 176) without realising that for the latter country a high rate of growth is economically embarrassing. Although the title mentions 'trials' along with 'triumphs', it is the latter which seems to have carried the author off his feet, the former are underplayed.

Sane is unaware that many deep tensions bedevil Soviet agriculture. Soviet agricultural history, he says, is "Continuous, uninterrupted and peaceful" since 1950 (p 120). He has obviously not heard of the alternate suppression and encouragement of the 'link' ('team'). The chequered history of the private plot is similarly unknown to him; his account (pp 86-87) gives the false impression that it was always favoured by the authorities. That problems of income distribution, work-incentives and work discipline did exist in the collectives would, I suppose, come as news to him.

The early years of collectivisation hold a perennial interest for students of Soviet agrarian history. Here Sane's treatment is remarkable both for what it omits and the manner in which it says whatever it does. That 'collection' of agricultural surpluses was the leading motive behind collectivisation is nowhere clearly mentioned. The exploitative role of the Machine Tractor Stations has not been referred to; Sane makes them look almost angelic organisations rendering beneficial services to the collective farmers. There is no mention of the food famine following collectivisation. The strongest words Sane can think of to describe Stalinist atrocities are 'play of force and arbitrariness', 'rough method', etc (pp 48, 50); by contrast the kulaks are described as having set into motion a 'campaign of terror' (p 52). The 'Gulag' is described as places where 'minimum subsistence' and 'new jobs' were found for exiled kulaks (p 53). How collectivisation took an ugly turn is 'difficult for an outsider' to judge. The only conjecture the author can advance is that it was 'perhaps' due to Stalin's 'dominating personality' (p 50). The early exploitation of the peasants is for him a 'loan' given by farmers to the State. The peasant resistance to collectivisation is explained by saying that the kulaks 'prevailed upon middle peasants to destroy their livestock'.

Attention may be drawn to a few interesting linguistic devices which Sane uses to cover up whatever is unfavourable to his thesis. Thus when the private plots on 3.5 per cent of the sown (and not 'used', as Sane says) area produce 33 per cent of the total output Sane would put this by saying, they produce '*no more than* one-third' (p 117), whereas the small area they occupy is made the justification for saying that they play a 'minor' role. Sane would not say openly and at the proper place that in respect of social security measures and amenities the rural areas were discriminated against for a long time, much later he would say they are *now* on par with urban areas (p 135) or that the rural people *now* live in well-built houses (p 138). Deficiencies are never straightforwardly owned up, they are obliquely suggested so that only a very careful reader might suspect their existence. A more glaring (and naturally less successful) method is to contradict a statement made at an earlier stage. For example, on p 83 the author tells us, in his characteristically vague fashion, that under the pre-1969 Model Rules the 'activity of the collective farms is under direct guidance' of state organs, however, on p 00 he makes the post-1969 situation hold good for all the preceding years by saying that 'contrary to the general belief outside, the Soviet plans are not a dictat from above'.

— S H Deshpande

Seventh Finance Commission's Award

I S Gulati

The Seventh Finance Commission's Award could have been much more progressive if (a) income tax were distributed differently, and (b) in the distribution on excise duties, the Commission had not been carried away by the incidence of poverty, ignoring that the other side of poverty in a state is the relative affluence of the relatively few.

Still, this award will have left its mark, mainly because its dispensation draws practically entirely on shareable taxes.

...

IN any future review of the contributions made by the various Finance Commissions, the award, just published, of the Seventh Finance Commission is bound to figure very importantly. The award makes a number of innovations, or departures from the past. Some at least of these departures, as we shall see presently, may mark a definite advance in the system of Centre-state devolution which has come to prevail in this country and will, I believe, stand well the test of time and history, but there are others which may not stand that test.

In our evaluation of the award, we shall concern ourselves with the basic scheme of resource transfer and not with issues such as debt and drought relief, however important they are in themselves.

Existing Scheme of Resource Transfers

In order to pinpoint, and see the significance of, the major departures made by the Seventh Commission, let us first be clear about what we regard as the bare bones, or contours, of the prevailing scheme underlying the statutory devolution of public funds from the Centre to the states. Firstly, statutory devolution has accounted for only about one-third of the total Centre-state fiscal transfers. Secondly, a substantial proportion, around one-quarter, of the statutory devolution takes the form of grants-in-aid, given largely with a view to covering the non-Plan revenue account gaps of such of the states as are left with gaps in spite of devolution of tax revenues. Thirdly, of the amounts devolving on the states as shares of tax revenues, the role of Central excises has gradually been increasing. During the Fifth Plan period they accounted for 45 per cent of the tax devolution. Correspondingly, the role of income tax in tax devolution has been on the decline. It accounted for over 80 per cent of the states' share in divisible taxes in the First Plan period and only 40 per cent in the Fifth Plan period. Apart from the fact that sharing excise revenues with the Centre enables the states to partake of the most buoyant source of tax revenue, it is only in the inter-state distribution of the share of the excise revenues that disparities between the states have been taken into account by giving some weightage to relative backwardness. On the whole, therefore, statutory transfers have tended to be regressive.

Most Significant Departures

The most significant departures, made from the past, in the scheme of resource transfer drawn up by the Seventh Commission relates to the role of excise duties. By proposing that the states should, hereafter, be assigned twice the proportion (40 per cent instead of 20 per cent) of Central excise revenue, the Commission killed, as it were, a number of birds with one stone. It would (a) enable the states to partake better of the most buoyant source of Central tax revenues, (b) make the states relatively less exposed to inflation, and (c) lend greater progressivity to the scheme of statutory resource transfer, given the old weightage to relative backwardness. In fact, the Seventh Commission claims to have introduced somewhat greater progressivity than before in its scheme precisively through the distribution of Central excise revenues.

The Seventh Commission has, like the earlier Commissions, forsworn the use of income-tax revenue for the purpose of effecting inter-state redistribution. If anything, by retaining the old pattern of inter-state distribution — i e, of determining the shares of individual states on the basis of Population (90 per cent) and Contribution (10 per cent) — even while raising the overall proportion of Central receipts from income tax to be earmarked for inter-state distribution from 80 to 85 per cent, the Commission was really going in the opposite direction. Indeed, the majority of the Commission decided to retain the old pattern of inter-state distribution against the powerful objections of Raj Krishna, which it sought to rebut rather unsuccessfully. So, there can be no doubt that it was done with open eyes.

Whether or not the Commission's actual attempt at introducing greater progressivity through the inter-state distribution of excise revenue was right and adequate is itself a matter for discussion. It led to a controversy within the Commission itself, as is reflected in Raj Krishna's Note of Dissent. As we shall note presently, the manner in which the Commission went about this business is very much open to debate which may not easily be stilled. Still, the Commission has shown considerable courage to make a drastic change in the proportions in which various components have stood so far in relation to each other in the overall scheme of statutory resource transfers, by assigning to excise duties a very much more preponderant role than they would have taken on in the normal course of things. By dint of this one single move, the Commission was in a position to reduce the portion of statutory transfers accounted for by grants to less than 8 per cent compared to 25 per cent in the five-year period. It is the grants which expose the state most to inflation.

Excise Distribution Formula

As to the manner of doing more than the past Commissions in the direction of reducing inter-state imbalances, what the Commission — to be precise, the majority thereof — decided was to distribute among the states their share of Central excise revenue by giving equal weight of 25 per cent to (1) the popu-

TABLE: COMPARATIVE INTER-STATE DISTRIBUTION ON THE BASIS OF SELECTED FORMULAE

	Population Basis	Distance from Maximum SDP Per Capita	Inverse of SDP Per Capita	Proportion of the Poor	Distance from Maximum Revenue Per Capita
Punjab	2.50	0.00	1.40	1.04	0.00
Haryana	1.85	0.54	1.17	1.15	0.53
Maharashtra	9.31	3.36	6.11	7.88	3.37
Gujarat	4.83	3.41	3.85	4.26	3.43
Karnataka	5.41	5.25	4.58	5.15	4.48
West Bengal	8.18	7.04	7.01	9.80	7.08
Kerala	3.94	3.84	3.68	4.72	3.86
Tamil Nadu	7.61	7.25	7.15	8.88	8.07
Andhra Pradesh	8.03	7.94	7.65	7.39	7.98
Rajasthan	4.75	5.48	4.93	4.33	5.51
Orissa	4.05	4.92	4.32	4.72	4.94
Assam	2.70	3.48	3.02	1.71	3.46
Madhya Pradesh	7.69	9.78	8.77	8.51	9.83
Uttar Pradesh	16.32	21.39	20.21	15.81	21.51
Bihar	10.41	14.93	14.29	12.82	14.95

Notes : (1) States have been ranked in descending order according to their average per capita SDP, 1973-74 and 1975-76.

(2) Figures of distribution on population basis have been taken from Table A.2 of Raj Krishna's Note of Dissent on "A More Equitable Distribution of Resources" attached to the Report of the Finance Commission, 1978.

(3) Figures of distribution on the basis of distance of SDP per capita, a factor adopted by the Sixth Finance Commission, have been worked out by ourselves.

(4) Figures of distribution on the basis of the inverse of SDP per capita have been worked out after multiplying each state's per capita SDP by its population. Without doing that, the results obtained looked absurd.

(5) Figures of distribution on the basis of Poverty Ratio have been taken from Raj Krishna's Table referred to in note (2) above.

(6) Figures of distribution on the basis of the distance from maximum revenue per capita have been worked out on the basis of a regression as indicated in the Report of the Finance Commission (p 87).

lation factor, (ii) the inverse of per capita State Domestic Product; (iii) the percentage of the poor in each state, and (iv) the distance of revenue potential of each state from the revenue potential of the state, Punjab, with the maximum per capita revenue.

The Sixth Commission had distributed the Central excise revenue among the states on the basis of a formula which took into account only two factors: (i) population, and (ii) distance of per capita SDP of a state from the per capita SDP of Punjab. The weightage given to population factor was 75 and to the distance in per capita SDP 25. Though I myself was a party to this formula, I have since argued that even then the case existed for reducing the weightage given to population to 25 and for raising the weightage to the distance in per capita SDP to 75, i.e, for reversing the weights between the two factors taken into account by the Sixth Commission.

The Seventh Award assigns to the population factor the weight of 25 only but rejects the distance in per capita SDP and replaces it by three other factors, of which the one closest to the replaced factor is the inverse of the per capita SDP. (Here the assumption is that the inverse is multiplied by population.) However, as can be seen from the Table giving comparative inter-state distribution which each of the factors would yield, the distance in per capita SDP was the most progressive. It can be seen also that the inter-state distribution based on Poverty Ratio is not only not progressive enough but can be even regressive in that it yields a distribution whereby the lower the per capita domestic product of a state, the lower can be its allocation compared to what it would be entitled to on the basis of its population. Of the four states with the lowest per capita domestic product, two get an allocation which is better than the allocation made on the basis of population and two do worse. Clearly, this comes about because the Poverty Ratio is not necessarily high for the states with low SDP per capita. But all the four states do worse than if the allocation were based on either the distance of per capita SDP or the inverse of SDP.

Raj Krishna's results look better, or more progressive, than the results of the majority's allocation largely because his formula applies to both income tax and excise duties and partly because his estimate of excise revenue is somewhat higher. Also, he retains weightage for the inverse of per capita SDP.

There is, in my opinion, an even weightier objection to the use of the Poverty Ratio as a factor, at all, in the inter-state distribution of shareable Central tax. The use of Poverty Ratio puts a premium on skewness. Between two states with the same per capita SDP, the one with a higher proportion of its people below the poverty line gets a higher allocation under both the majority's, as well as Raj Krishna's, dispensation.

Even if one conceded the argument that "the poverty problem of some states is partly the result of special factors on which the [state] governments concerned have little control", the fact remains that the greater skewness of income distribution in the states with a higher proportion of people below the poverty line affords these states with opportunities for raising higher revenues a factor that is given no recognition, even by the majority, in the application of its revenue equalisation principle. Raj Krishna, unfortunately, assigns no role to the revenue equalisation principle and prefers resort to grants under Article 275, to reduce "revenue surplus distance".

REVENUE DISTANCE

The introduction of the revenue equalisation factor in the inter-state distribution at least of the excise revenues is, in my view, welcome though, as stated above, I would have liked the formula to allow for differences between states in income distribution and therefore in taxable capacity, particularly when Poverty Ratio was being used as a separate factor in determining a particular state's share. However, even as it is, the revenue equalisation factor as devised, seems to yield quite a consistently progressive allocation. The Table mentioned above brings it out.

CONCLUDING OBSERVATIONS

All in all, therefore, the Seventh Award could have been much more progressive if (a) income tax was distributed differently and (b) in the distribution of the excise duties the Commission had not been carried away by

the incidence of poverty, ignoring that the other side of poverty in a state is the relative affluence of the relatively few in the same state. If this award will have left its mark, it will not be, however, because it is more progressive in the inter-state distribution of its dispensation, nor because it seeks to transfer more from the Centre to the states — even the Sixth Commission's dispensation had worked out to twice that of its predecessor Commission — but because this Commission's dispensation draws practically entirely on shareable taxes.

Women's Studies: New Perceptions and the Challenges

Vina Mazumdar

Kumud Sharma

Why has the process of understanding women's contribution — social, economic and political — been shrouded in mystery?

Why were women's concerns generally seen by planners and social scientists as welfare rather than development, or as peripheral rather than central to the development process?

What were the historical and ideological dimensions of women's roles and status in Indian society?

Do the empirical dimensions selected by social scientists to analyse women's roles and status actually represent operational indicators of women's status and are they applicable to all groups of women?

The conceptualisation of these problems raises some substantial issues and is a challenge to researchers in the area of women's studies.

THE new academic search to organise knowledge on various aspects of women's situation, resulting in changes in perception about women's contribution to society and their needs and problems in the context of modernisation, development and social change has raised many issues. In their effort to place the contemporary situation in proper perspective, social scientists concerned with women's problems have sought explanations in (a) the historical cultural framework of a society, (b) in the evolution of policies and strategies for national development, and (c) in biases inherent in the concepts and methodology of social research. It has been contended that using identical standard indicators to measure changes in the quality of life of heterogeneous segments of the population has been a constraint in understanding the complex roles of women in the context of the wider society and its various subsystems.

Research on women is not new but the studies offer a variety of concern with shifting emphasis and perspectives, depending on one's theoretical orientation, ideological alignments, changes in the contemporary situation and in priorities for social and national development. These shifts in emphasis and approach have much to do with trends in current thinking on specific issues relating to the total population in society as well as to women in particular. The emphasis has sometimes been on human rights and social oppression of women, on population policy and planning, the issues of poverty, unemployment, inequality and strategies for survival or on equality in education, health, political and economic participation and other opportunities for development.

Early researches on women in India were primarily done by social historians, indologists, anthropologists and sociologists. Historians and indologists investigated the position of women, mainly of the high caste and elite sections of society, reasons for the deterioration in their status and the emergence of social evils like child marriage, suttee, the general oppression of widows, purdah and illiteracy. They shared the concerns and the basic ideology of the social reform movement which sought to cleanse Indian society of institutions and practices which were believed to be deterrents to national resurgence and progress and which gave India a bad name in the eyes of the Western World.

Latent within the Reform Movement's humanist aims was a perception that traditional Indian culture and values must be strengthened to resist the inroads of Westernisation. As custodians of traditional values and cultures, women were viewed as potential allies in this struggle, provided their weakening influence within families could be strengthened by education and improved legal status.[1] Historians and reformers argued that customs like child marriage, purdah, the oppression of widows, and the denial of education and property rights to women were indicators of cultural degeneration, not intrinsic attributes of Indian culture. Opposition to this idea came only from one or two radical thinkers[2] — who perceived oppression of women as a traditional *instrument* for maintaining social inequality, and the high castes in Indian society.

Shift in Perspective

The merging of the social reform movement into the political movement for independence resulted in a marked shift in the perspective on women's issues. Democratic ideology and the recognition of the need to obtain women's support for the national struggle resulted in the acceptance of the principle of equality of rights, status and opportunities for participation in the process of national development. The marked increase in the participation of women in the freedom struggle from the twenties was reflected in an increase in research and debate on women's issues. The new literature continued the earlier concerns but with the added dimension of equality in the field of political activities.

The greater involvement of women

in the task of political mobilising, social reconstruction and national development through instruments of directed social change, called for a fundamental redefinition of sex roles. The signal for this redefinition was given in the writings of Mahatma Gandhi. Viewing women as an oppressed group, Gandhi projected them as potential vanguards of a radical but nonviolent process of social transformation. Removal of their existing disabilities — legal, educational, and social — and equality in the arena of political decision-making and individual role-choice were, in his opinion, only preconditions for women to play ther 'historic role'.[3]

It is amazing that in spite of the acceptance of the equality principle by national leadership and the Constitution-makers — the thrust for redefinition of sex roles had only a marginal impact on the work of social scientists. A trend survey of research on women[4] indicates that in the period up to 1950 the focus of research was primarily on general surveys of women's roles and status within the narrow perspective of the family, kinship and the community, with education occupying the second position. During the fifties which ushered in reforms in personal and labour laws, there was some increase in studies on legal and economic status of women. The legal studies, however, predominantly focused on scriptural and statutory laws, which affected mainly the upper strata of society, especially the urban educated class, the lives of the majority of women continued to be governed by customary laws. Serious research on customary laws by legal scholars did not begin till the seventies, though anthropologists accumulated information on them from a much earlier period. In the economic sphere, studies concentrated on the modern sector of the economy which attracted the attention of planners as well as academic scholars. Since the participation of women in this sector, whether in blue-collared or white-collared activities was marginal throughout this period, research on women's roles and opportunities in economic activity remained marginal. Agricultural economics which began to develop rapidly from this period, surprisingly ignored the major role played by women in agriculture and the manners in which they were being affected by the process of modernisation.

Why did the social sciences fail to respond to the ideas articulated by the nineteenth century radicals and Gandhi? Why did the women's movement, and the national debate on women's roles in society die out from the mid-fifties? Why did development planners as well as women's organisations perceive women as objects of marginal welfare services rather than as a concern in economic planning? Even the Community Development Programme, intended as a multi-dimensional instrument for both social and economic development of the rural population, originally overlooked women,[5] and included them later only as recipients of family welfare services, not of productivity programmes in agriculture.

Answering these questions calls for considerable research. Only some partial explanations have been offered recently.[6] Persistence of the urban middle-class bias in perception of social problems, inadequacy of data, over-concentration on economic at the cost of social development, complacency among educated women and women's organisations after winning constitutional and legal equality, adoption of the Western industrial rather than the Gandhian model for development, may all have contributed to the process. Another possible reason could be the national consensus to keep the women's question out of the sphere of political controversy, projecting it as a purely social issue of long-term changes in attitudes through education and development. There is little doubt that this consensus was the outcome of the perspective that the sources of women's oppression were all to be found within traditional attitudes and cultural institutions rather than in the socio-economic and political structures of society.

Demographers' Interest

The demographers' interest in women stemmed firstly from the population problem, and secondly from the declining ratio of women in the Indian population, a trend observed from the first Census in 1872. It is amazing that with the exception of one or two scholars, the declining sex-ratio was not taken up as a major issue related to the changing status of women till the seventies of this century. The problem of population growth, which tended to overshadow all other demographic issues, resulted in an enormous volume of research on population problems and policies, acceptance and attitude towards family planning (KAP studies) and identification of areas of success and failure with a view to reducing population growth.

A by-product of research on family planning was a renewed emphasis on women's education which was expected to improve both their access to family planning services and their general status. This view of the social scientists was in harmony with the general attitude of planners, which confined programmes for women's development to education, health and welfare. In collection of data and information regarding women, this narrow focus persisted and little attempt was made to relate these variables to other major determinants of status like employment, family income, class and caste positions, etc.

These biases prevented both social scientists and planners from noting with any serious concern the decline in women's labour force participation reported by the Census of 1951 and some sectoral studies. A few attempts by economists to examine women's role in the labour force invariably led to one or more of the following conclusions:

(a) that the data was unsatisfactory and non-comparable to that on men — therefore it could not be used for any serious analysis;
(b) that women's participation in economic activity was essentially determined by cultural attitudes and was thus beyond the purview of the economists; and
(c) that women's employment could only expand with education and change in social attitudes and could thus be dismissed as a long-term objective for which no immediate concern was necessary.

Some of the later researches in the population field did point to employment as a possible variable. But they viewed the relationship between women's employment and fertility decisions predominantly in the context of the 'role conflict' theory — of women seeking jobs outside their homes and facing a conflict with their traditionally accepted roles within the home. It should be noted that in the Indian context, or that of any predominantly agrarian society, this theory is only applicable to middle class working women, who are *new* entrants to the labour market. The preoccupation with role conflict indicates the failure on the part of scholars to recognise the importance of women's traditional economic roles in agriculture and the household economy. As stated earlier, this received only cursory attention, as an aspect of cultural variations. While anthropological studies did occasionally note rural women's economic roles, they failed to examine any changes, either quantitative or qualitative, in

women's participation in economic activity.

The report of the National Commission on *Labour (1969) drew attention* to the problems of wage discrimination and general oppression of women workers, particularly in the rural sector, and criticised government's failure to protect their health and working conditions. The report of the Expert Committee on Unemployment Estimates (1970), (which consisted primarily of social scientists) admitted, however, that apart from the limitations of quantitative data, the heterogeneous charactor of the Indian economy, the uneven rates of development in different regions and sectors, and the varying impact of modernisation on different segments of the labour force posed serious problems in examining and assessing the dimensions of the unemployment problem. The Committee recommended that it was imperative to estimate different 'segments' of the labour force separately, "taking into account such characteristics as religion, sex, age, rural and urban residence, status or class of workers and educational attainments". The 28th Round of the National Sample Survey, which followed this report attempted for the first time to estimate the size of women unemployment, and the Report of the Committee on Unemployment (1973) admitted that unemployment among women was of a far higher order than had been hitherto suspected.

Research on women can broadly be grouped into (a) macro studies focusing on general features of socio-economic development, how sex roles are enacted and performed and the nature of the transormations which alter and affect them, and (b) micro studies that explore specific situations in which women are placed.

First Major Attempt

The Report of the Committee on the Status of Women in India (1975) was the first major attempt to review and evaluate data on various aspects of women's status and the directions of change in women's roles, rights and opportunities due to planned development. The Committee's investigation revealed that changes in women's roles are the by-products of many events, viz, changes in the mode of production through commercialisation, capital sation, and technological developments; shifts in the value systems through the process of modernisation, urbanisation and the rising standards and costs of living; as well as legislative reforms, expansion of education, demographic transition and political developments. Some of the major questions that confronted the Committee during its investigations were

(1) Why has the process of understanding women's contribution — social economic and political — been shrouded in mystery?

(2) Why were women's concerns generally seen by planners and social scientists as welfare rather than development, or as peripheral rather than central to the development process?

(3) What were the historical and ideological dimensions of women's roles and status in Indian society?

(4) Do the empirical dimensions selected by social scientists to analyse women's roles and status actually respresent operational indicators of women's status and are they applicable to all groups of women?

The conceptualisation of these problems raised some substantial issues and is a challenge to researchers in the area of women's studies.

The Committee experienced a major difficulty with regard to data, particularly on the unorganised sectors of the economy and women of the poor classes, and concluded that the indicators used to measure women's position in the changing social process did not reflect Indian social realities — particularly of rural society. Identifying an inter-relationship between the disturbing trends revealed by the declining sex ratio, low life expectancy, higher mortality, declining work participation and increasing migration of women, the Committee concluded that they were indicators "of a process of change that is moving in a direction opposite to the goals of our society and its plan for development". In the Committee's view, these demographic trends represented the groundswell of a process of devaluation of women. The surface manifestations of the same process were visible in the increasing volume and penetration of the dowry system, increasing commercial use of and traffic in women, and the development of social attitudes that suggested "regression from some of the norms developed during the Freedom Movement".

Studying the 'Invisible Women'

The growing realisation of the inconsistencies developing between social goals and the development process has stimulated an exploration of people-oriented or specific group-oriented approaches to the study of development. The information that is now being generated by research studies on women, particularly with a "third world focus", however, has brought to the surface many issues relating to women and the development process, an important area of concern for both development planners and academics. Several streams of new thinking have also emerged in India, as a result of the Committee's Report and later studies on 'invisible women' which is one of the important objectives of the ICSSR's programme of Women's Studies.

Responding to the Committee's appeal that "changes in the status of women will be a long-term aspect of our social process and will require continuous examination and assessment by persons interested in social change", the ICSSR adopted a programme of sponsored research with the following objectives:

(1) generation and analysis of data in order to uncover significant trends in patterns of social and economic organisation which affect women's position in the long run;

(2) development of needed new perspectives in the social sciences, particularly through clarification of concepts like the family, household, women's work, economic activity, productivity, etc, the restrictive and ambiguous use of which has resulted in a general under-assessment of women's contribution to society.

The programme emphasises the study of women in the poor or "less visible" sections in Indian society with a view to understanding the regional and sectional differences in roles, status and problems of women and the differential nature of the impact of development on their lives. This emphasis has been provided in order to correct the bias of previous research and policies for women's development which were primarily influenced by the experiences of women in the elite classes. The National Plan of Action for Women which was framed by the government of India on the basis of the findings of the Committee on the Status of Women in India has also emphasised the need for purposive and problem identifying research to facilitate designing of appropriate development policies and programmes, particularly for the weaker sections of women who have been adversely affected by the process of change.

The Council's programme initiated a series of critical evaluation of available source of data and a series of micro studies on conditions of identi-

sizable groups of women workers in the informal sector in order to explore how structural changes in the Indian economy have affected the occupational choice and the life styles of these women. These micro studies as well as detailed analysis of demographic data have substantially confirmed some of the findings of the Committee on the Status of Women.

A major exercise undertaken by the programme was preparation of time-series data to examine changes in the relative positions of men and women in the population, in different occupations (both traditional and modern), and in access to literacy.[7] The unit of of analysis was the district, in order to highlight regional variations in these trends. The result of these studies indicate a significant parallelism between economic modernisation and changes in the relative position of women and men in the labour force and in particular occupations, in the population as a whole and in growing differentials in mortality, life expectancy and access to health services and literacy. Micro studies on women in the informal sector show that the main reason for their migration from their home villages is not the 'pull' of better opportunities in the cities but pauperisation caused by the disappearance of their traditional avenues of employment.[8]

A study conducted in Calcutta[9] reports that in spite of the fact that there has been no significant increase in wage rates over the last seven years, more women are coming forward to work in the informal sector. Of the later entrants, an increasing percentage comes from families with no tradition of women working for monetary returns outside their homes. This 'bottomless pool of cheap labour' and its growth in recent years, in response to newly developing manufacturing concerns using mainly female and child labour in small workshops and through the putting-out system, does nothing to reduce poverty and misery. The entrepreneurs use this labour for decentralised production, thereby avoiding the regulations of factory legislation and corporate taxation and the process acts as an obstacle to the growth of the organised or modern high-wage industrial sector.

The study on migrant women in the slums of Delhi[10] indicates that the burden of increasing poverty falls heavily on women, particularly as migration results in the loss of support from their own family and kin groups. The study has also found that the selection of metropolitan cities for migration is invariably on the anticipation that they will offer some opportunity for employment to women in the domestic service sector or in construction work. The men in these families often remain unemployed or only casually employed for a long time and the family is dependent mainly on the women's income. When these women come from high-skilled occupations like weaving, they consider their urban occupation in domestic service as degrading and involving a loss of status. Their illiteracy and lack of other marketable skills leaves them little alternative to such low paid unskilled work.

While these studies increasingly offer evidence of the growing burden of work, and loss of both physical and emotional support from the family among women who are moving down the social ladder through increasing poverty, there is another established process of change in the roles and status of women in upwardly mobile groups. Such upward mobility may take place from increasing prosperity, or men's access to more 'socially respectable' occupations through the spread of education amongst the lowest strata in the society. M N Srinivas describes this as the 'sanskritisation process', when lower social groups adopt the behavioural norms, life styles and ideology in sex roles of more dominant groups in society.[11] In rural agricultural classes, the roles of women vary at different levels of the land and caste hierarchy. Respectable status is regarded as inconsistent with women's wage work outside the family. In small and marginal farms, women work on the family farms. Increase in prosperity with agricultural development results in their withdrawal from active participation in field agriculture. The immediate consequence of this process, according to Srinivas, is a stage of 'immurement of women' when they are subjected to seclution, differential treatment in access to education and other developmental services and are increasingly regarded as tools for improvement and display of the families' social status. This is manifested in the introduction and inflation of the dowry system even in such families which had traditionally practised the opposite custom of bride price.[12] While there is evidence of a loss of relatively equal position in decision-making between men and women in such families, the area that remains to be investigated is women's perception of such changes in their roles.

Women's Status and Social Stratification

Such studies clearly indicate an integral relationship between variations in women's roles and status and the nature of social stratification. It was hitherto believed that women's role in agriculture was predominantly determined by their caste position. The studies undertaken under the Women's Studies Programme suggest that there are other factors influencing this. The agrarian structure and land relations, though generally related to the caste structure, may exert independent influence on women's work roles and status. Changes in the demand and supply of agricultural labour, resulting from migration, changes in cropping patterns, the introduction of new technology or the opening up of alternative labour markets as well as landlessness have been found to affect the utilisation of female labour in agriculture.

A significant factor in these changes is women's access to particular agricultural skills. One study suggests that what has frequently been interpreted as a social taboo on women's participation in field agriculture in certain regions of the country may be a consequence of some change in the labour market situation at an earlier date. Agricultural skills are easily lost if not practised regularly. Thus women who were withdrawn from agricultural activities sometime in the past are unable to return to this occupation at a later date or to transit the skills to their daughters.[13]

Changes in the income level of the family which have generally been found to act as a compulsion or deterrent to women's employment have recently registered some variations. As the study of Delhi Slum Women indicates, rural artisan families who confine women's work to unpaid processing operations within the home, are prepared to push them into paid work in the cities as a means for the families' survival and security.

These studies suggest that any improvement or increase in employability of women (in domestic work in cities or dairy development in the rural areas) may not only result in the withdrawal of social taboos, but may increase women's work burden to enable males in their family to search for better employment or improved qualifications. This process is visible even among the middle classes. In the traditionally arranged marriage market in the metropolitan cities, the demand for employed brides has shown a marked increase.

Conventional approaches usually

opted literacy and education, employment, and political and legal rights as the only indicators of women's status, and progressive equality. Research on family planning uncovered another indicator, that of role in decision-making, as vital in fertility choices. Recent studies suggest that the relative importance of these indicators vary according to position in the social hierarchy.

In traditional high-status families which secluded women and denied choices in marital matters, older women performed many managerial functions, and commanded considerable power in family decision-making.[14] The source of this power certainly did not originate in extra-domestic spheres or in formal education or economic independence. Younger women from this group were the first to receive access to the new opportunities opened through expansion of education, employment in various professions, other white-collared services and political careers. Many studies have reported that women's expanded roles have not necessarily increased their role in decision-making. For some there has been an improvement in status — but how much of such gain stems from individual achievement and how much from the family's status has not been examined adequately.

At lower levels of the society, women were economically active and enjoyed relatively higher degree of autonomy in marital choices and in interaction with men. Whether the absence of seclusion allowed them to play a more effective role in decision-making within and outside the family needs to be investigated. What has been observed is a loss of status and power among these women when they are moved from their traditional background into a different setting, even though they may continue to be economically active.[15]

Studies on political awareness and participation of women are challenging the older thesis — that education, employment or urbanisation *per se* result in increased political consciousness or participation of women.[16] On the other hand the fading out of women's issues from the political arena and declining representation of women in all elective offices from the second decade after independence has opened up new areas of investigation which are only being explored at the moment. Why has the number of women in legislative bodies declined while voting participation increased at a faster rate than men's? Why have states with the lowest participation of women voters elected the largest number of women legislators and states with the highest political mobilisation of women selected the least? Why have political parties, trade unions, co-operatives and other politicising organisations ignored this vast source of support and treated them mainly as appendages of the family. It is only during elections of 1977-78 that some appeals to women as separate from men have been taken up, marginally, by leaders and parties in limited areas. Has formalisation of the political process increased or decreased women's ability to participate meaningfully in politics? Why do women respond more eagerly to movements than to established political activities? Why with some women entering the highest offices without any opposition (on the ground of their sex), have women been so powerless at all levels of the political process.

The process of development in its entire complexity renders the task of understanding the meaning of such changes in different groups more difficult. It also demands a re-examination of conventional theories and strategies for women's development and the relative importance of these indicators used to determine changes in their status.

Micro Studies

Realising the complexity and the magnitude of problems of women and development and the need to examine various dimensions of these problems, the ICSSR's programme sponsored mi-

[illegible] try to examine the differential impact of the development process and the causal and structural linkages of micro-situations with macro-variables. Some of the issues which are currently being studied at micro level are:

(i) Does a particular development strategy result in development for men and underdevelopment for women?

(ii) Does development and modernisation lead to a change in the sexual division of labour and differential in socio-economic status and income between the sexes, women enjoying less control over and access to resources without any reduction or change in their traditional responsibilities?

(iii) How are the roles of women being affected by changing modes of production and production relations and its effect on skill generation and promotion?

(iv) How do policy choices and policy interventions in the economic sphere lead to important changes in non-economic spheres and the interrelationship that exists between the two?

Available data on rural women do not generally provide answers to such questions as how flexible is the division of labour between the sexes, what is the impact of technology and labour migration in terms of labour displacement and labour demand and its implications for women, the forms of dominance operating in the labour market and their control over the labour process and products and conditions under which women contribute their labour in the production systems, etc. This will necessitate an examination of not only the system of stratification but the whole gamut of relationships in which women of different households are directly or indirectly involved. A study on rural households[17] is seeking to explain their response and decision regarding labour with the aid of time-disposition data.

The problem of widening women's access to the development process — both as beneficiaries and as participants, is complicated by conflicting social trends and policy choices. The claims of democratic decentralisation may conflict with the needs of women for special attention, as local authorities have often been found to be neglectful, if not hostile, to women's rights and needs. The desire to provide women with employment opportunities within the household sector, so as not to conflict with their family roles, tends to clash with other social objectives e.g.:

(a) to diversify women's employment opportunities, access to new skills, knowledge and the wider society, with a view to increasing their self-reliance, bargaining power and participatory opportunities and rescuing them from their present status of unpaid family workers;

(b) to eliminate the present tendency to relegate women to low-paid, low-skilled and low-status occupations which reinforce discriminatory attitudes and practices;

(c) to promote voluntary acceptance of the small family norm, as studies have shown that household industries tend to encourage growth of large families, and the exploitation of women's health and labour;[18]

(d) even a policy to promote women's self-employment in the small scale sector sometimes provides only a thin guise for men's monopoly over resources, and control over such enterprises, with the woman not even able to control her income.[19]

While widening opportunities for employment emerges as critical for women's development, inadequate attention to their other needs — for knowledge, health and conscious autonomous participation in decision-making — has tended to encourage their exploitation and consequent regression from the principle of equality.

The draft Five-Year Plan 1978-83 has suggested a strategy of increasing investment in 'women-preferred' industries, i e, industries which employ a large number of women. The Working Group appointed by the Planning Commission has however pointed out that such a policy may only strengthen the trends observed in the last few decades: (a) of women's concentration in low-status occupations; and (b) their displacement with increased investment in capital intensive technology (particularly observed in textiles, jute, agriculture and agro-industries). The Group also observed that the fiscal policies and other measures favouring capital investment rather than increased employment have further strengthened this trend.

Integration with Plan Strategies

The uncomfortable findings of recent research, the increasing realisation among planners of the inter-linkages that exist between poverty, unemployment, inequality as well as the population problem, and the international pressure for the "integration of women in development", have combined to generate some interest in women's studies, and the search for policy measures to diversify and expand opportunities for women's participation. Attempts are being made to integrate women's needs within the Plan strategies for full employment and distributive justice. Some of the instruments being discussed by different working groups (which include development administrators, field workers as well as social scientists) are:

(a) organisations of under-privileged women to protect and generate employment, to provide access to skills and other types of knowledge health and child care services, and above all to function as pressure groups to increase their participation in development decisions;

(b) establishment of specialised agencies at different levels to act as mobilisers and catalytic agents, in order to promote women's development and participation;

(c) development of multi-disciplinary training and orientation of development cadres and research scholars on women's issues;

(d) introductory special protection/preferential treatment for women in all sectoral and area plans and in vocational training.

The revival of interest on problems of women owes much to the International Women's Decade and to the rather alarming findings of the Committee on the Status of Women in India. The latter contributed to a range of new perceptions which have influenced the studies sponsored by the ICSSR and a few other agencies. It must, however, be admitted that the overriding concern for improving the quality of intervention in favour of some target groups, and to arrest the trend towards devaluation of women, has resulted in a concentration of research interest in the sphere of economic participation, particularly of women in low income groups. While such research has certainly helped the search for new policy instruments, there has been neglect of some of the vital areas of theoretical concern for understanding women's roles and position in society. For example, while most of the studies perceive a linkage between women's status/roles and the stratified structure of society and power relations, we have yet to discover the *determinants* of women's status as perceived by women, and by others, at different levels of society. A second area on which work remains to be done is the interlinkage

[illegible] variations in family structure, [illegible] roles, values and the socialisation process, leading to identity formations. Though this was recognised as a priority area in the ICSSR programme, we have not been able to make any progress so far, mainly because it has been difficult to attract social-psychologists to work on these problems. The third [illegible] investigated area is in the sphere of decision-making, leadership and mobilisation — or women's perception of oppression and the need for change. Questions have been raised as to why all movements for social justice, whether in the religious or socio-political sphere attract women in large numbers, both as followers and as leaders. Virtually no work has been done on women's participation in these movements, either in the distant or in the recent past. Nor have we studied the impact of such movements on women. Women's response to the Gandhian movement is recognised but has yet to be explained or understood. The ICSSR's programme included the women's movement as another priority area, mainly with a view to finding explanations for its decline in the post-independence period, and its failure to arrest the intensification of the devaluation process. It has not however been possible to promote any major interest in this field. A possible reason for this may lie in the rather lukewarm response from historians to the challenge of women's studies. It is interesting to note that unlike the Western countries, Economics, Sociology and, to a less extent, Political Science have provided the main response to this challenge in India.

Masterpieces inspired by Indian Dyes

KALAMKARI

KALAMKARI is an exquisite art of painting on cloth with the use of vegetable dyes *This art flourished in South India around the 14 century A D*

Derived from Kalam (pen) and 'Kari (art) it is a superb style of fine line painting based on themes taken from Indian mythology

The colours reflect the *variegated* hues of temple interiors and bear elegant witness to the skill with which Indian artisans used their limited range of natural dyes

Indian dyes have come a *long way since then*

At Atul Products we produce a wide range of Synthetic Dyes which help colour everything from fabrics of cotton jute wool art silk and man made fibre to leather and paper

Atul also produces Dye Intermediates to help make Synthetic Dyes and Optical Whitening Agents which make whites look whiter

Every Atul Product is a masterpiece, painstakingly blended and like the ancient undying hues of Kalamkari—rich, vivid and universally appealing.

Wherever there is colour, there is a dye **Atul makes some of the finest man-made dyes.**

THE term financing institutions, it would seem, need the Soft Loan Scheme almost as much as do the industrialist beneficiaries of the scheme. Take, for instance, the Industrial Development Bank of India (IDBI), the largest of the country's industrial term lending institutions. According to the IDBI's annual report for 1977-78 (July-June), released belatedly last week, direct loans, other than for exports, sanctioned by it during the year showed just a small increase of Rs 22 crores, from Rs 242 crores in 1976-77 to Rs 264 crores. And virtually the entire increase was accounted for by the Soft Loan Scheme, sanctions under which rose from Rs 37 crores to Rs 57 crores.

No wonder, then, that the Soft Loan Scheme has turned out to be a very different sort of animal from what it was supposed to be. No wonder also that systematic lobbying by the financial institutions has been responsible for this transformation. The Soft Loan Scheme was introduced in 1976 to stem the spread of 'sickness' in industry by providing finance on concessional terms for modernisation of plants in cotton, textile, jute, cement, sugar and specified engineering industries. Only units which were in a bad shape financially and so could not raise and service loans on normal terms were intended to be assisted under the scheme. This was the justification for fixing the interest rate on loans under the scheme at 7.5 per cent (compared to the IDBI's normal rate of 11 per cent) and also for extending other concessions, such as in respect of *promoter's contribution, debt-equity ratio, initial moratorium and repayment* period.

But, as a result of joint lobbying by industrialists and the term-financing institutions, the government agreed that even profit-making units could be granted soft loans to cover a part of their requirement of finance for modernisation — on the argument, advanced by the chairman of the IDBI, that the scheme "was essentially meant for the modernisation of industrial units and not [merely] the survival of sick units". Following further joint lobbying, a number of other concessions were made, most importantly that in respect of loans under the scheme the financial institutions would not have the option to convert a part of their loans into equity (the so-called convertibility stipulation). Further, in August 1978 the list of engineering industries eligible for assistance under the scheme was substantially enlarged. The requirement that an industrial unit should have been set up at least 15 years earlier was reduced generally to 10 years, and even this requirement, according to the IDBI's annual report, is "relaxed further for units needing diversification or which can substantially increase exports either by reducing cost or upgrading quality". In other words, assistance under the scheme need not be for replacement and modernisation at all, but could be for diversification or, even more vaguely, for export promotion. Virtually any applicant for assistance from the term-financing institutions — except perhaps an entirely new undertaking — can thus stake a claim to the Soft Loan Scheme. The IDBI's annual report envisages that in 1978-79 sanctions under the scheme would further shoot up to Rs 75-100 crores and disbursements to Rs 60 crores. Units belonging to the houses of Tata, Modi, Mafatlal, Shri Ram and Birla, among other large houses, figure prominently in the list of those to whom IDBI advanced soft loans in 1977-78 — at 7.5 per cent interest rate and on other concessional terms and, most important of all, without the irritant of the convertibility stipulation. Clearly, the Soft Loan Scheme has become a device for established companies to get funds at much lower than the regular rate of interest and for evading the other conditions and stipulations which are popularly imagined to attach to assistance extended by government-owned financial institutions like IDBI.

In this context, the interest rate structure of the term-financing institutions deserves some notice. On paper it is part of government policy to encourage small-scale units and small entrepreneurs by charging lower rates of interest on loans advanced to them. In fact, however, large units get loans cheaper than small industries. The IDBI's normal lending rate for large units is 11 per cent per annum. However, we have noted above the extensive and growing use by these units of the Soft Loan Scheme under which they get finance at 7.5 per cent. In addition, the IDBI charges only 9.5 per cent on loans to projects located in specified backward districts. How liberally the so-called backward areas have been delineated can be judged from the fact that out of IDBI's total direct assistance of Rs 969 crores sanctioned from its inception upto June 1978, Rs 527 crores was for projects in backward districts, of which Rs 268 crores was at the concessional rate of 9.5 per cent.

By comparison, under the IDBI's schemes for refinance of industrial loans, the rate expected to be charged by the primary lender to certain categories of

small scale industries and small borrowers (loans to whom are, moreover, protected under the government's credit guarantee schemes) are as follows (the rate specified by IDBI is described as the 'ceiling' rate, but in fact it is the rate actually charged by the primary lender):

(i) Small-scale industries covered under the Credit Guarantee Scheme and the Technician Entrepreneur Schemes and loans upto Rs 5 lakhs for fishing units: 11 per cent per annum.

(ii) Single truck operators covered by the guarantee of the Credit Guarantee Corporation. 11.5 per cent per annum.

Completely contrary to official propaganda, interest rates become more regressive as the size of the borrowing unit and the loan becomes smaller. Though small loans are exempted from the minimum interest rate of 12.5 per cent prescribed on commercial bank advances, banks invariably charge 13 to 14 per cent interest on such loans. But that is not the worst of it. In addition to the interest, banks milk small borrowers by exacting from them incidental expenses, service charges, legal expenses including notice charges and, quite often, even the guarantee fee payable to the Deposit Insurance and Credit Guarantee Corporation. As a result, the effective rates of interest on small loans of, say, Rs 1,000 turn out to be well over 20 per cent per annum.

Politics

Survival of the Unscrupulous

IT was just about a month ago that Charan Singh had made his long-postponed statement on the circumstances attending what he described as his 'expulsion' from the Union government wherein, apart from giving his version of these circumstances, he also made many grave and specific allegations against the Prime Minister. The following day he addressed the 'kisan' rally, patently intended to demonstrate his 'mass base'; and in the days following, besides ruling out 'finally' that he would ever join the Desai government, he also proceeded to make some highly visible gestures of conciliation towards Indira Gandhi.

And yet, barely a month after he vowed that he would never join the Morarji Desai government Charan Singh has done precisely that. What is notable about the 'reconciliation' is that neither has Charan Singh retracted any of the serious charges he had levelled against the Prime Minister, nor has the Prime Minister said anything about the equally harsh things he had said about his former Home Minister. The supposedly principled differences concerning the precise ways in which the government should proceed against Indira Gandhi, collective responsibility in government, the alleged anti-kisan and pro-big industry bias of the present administration, and, most serious of all, the charges and countercharges traded by Morarji Desai and Charan Singh about their respective families — all these are apparently to be considered now as just so much wind. Apparently, with the mere return of Charan Singh to government, all the talk about the 'non-performance' of the government too is going to cease, and it is all going to be one big, happy family.

The scenario, it is needless to say, is not merely unrealistic, but is not even accurate. About the only positive and healthy aspect of the shabby deals that have been gone through by the top leaders of the Janata party in the last few days is that it has once again thoroughly exposed them as completely unscrupulous men. Morarji Desai, the uncompromisingly principled leader, has had to finally give up his fantasies of prime ministerial prerogative and recognise the reality that he leads a coalition government, and is not entirely free to choose his ministers. Charan Singh has had to eat many of his words, and it is still to be seen whether he can make any impact on the traditional apportionment of the funds of government of India merely by becoming the finance minister.

The prospects are that conspiracies will continue; the leaders have realised that they can survive, at least for a while, without the full participation of others. For over six months, leaders of the Janata, especially Charan Singh and Morarji Desai, practised the art of brinkmanship; there is no reason to believe that they will not take recourse to it again — as the latest developments in Uttar Pradesh indicate. Nevertheless, there is no reason why the patchwork arrangement should also not work, along with the conspiracies, just as the absence of such an arrangement worked so perfectly well for almost seven months now.

Banking

Numbers Game

AT his last meeting with bankers on November 28, 1978 the Governor of the Reserve Bank had expressed serious concern over two developments. First, expansion of bank credit to the commercial sector, and consequently of money supply, during the current financial year till then had been considerably larger than in the corresponding period of last year. Secondly, the banks' performance in respect of priority sector lending had been notably unsatisfactory. According to the assessment presented then, money supply had expanded by 10 per cent between March 31 and November 10, 1978, compared to only 5.8 per cent in the same period of the previous year. According to the Reserve Bank Governor, the expansion in gross bank credit after March 1978 upto November 10, 1978 had been Rs 1,588 crores "as against a rise of Rs 345 crores in the same period last year".

Even at that time these figures had seemed *prima facie* wrong. Our correspondent, commenting upon the new credit policy, had expressed his misgivings thus: "It could be argued that, unlike this year, the busy season last year had been preceded by very slack credit expansion. This is only partly true, the total gross non-food credit expansion between end-June and November 18, 1977 had been of the order of Rs 728 crores. The RBI has sought to give the impression that the expansion has been only Rs 283 crores, by using the March 31 figures based on 'special returns' instead of the last Friday figures based on section 42 returns" (*EPW*, December 2, 1978, p 1971). In a press release this week the Reserve Bank has admitted that its figures for March 31, 1978 in respect of banks' deposits, credit and investments were indeed completely off the mark. According to the 'revised' data now put out, banks' aggregate deposits on March 31, 1978 were Rs 534 crores higher than the figure the Reserve Bank had been using till now. Bank credit and banks' investments were similarly higher by Rs 221 crores and Rs 510 crores, respectively. As a result, the expansion in banks' deposits, credit and investments in 1977-78 turns out to have been considerably larger than so far estimated by the Reserve Bank; correspondingly, the increase in these magnitudes in the current year turns out to be smaller.

For all that, the Reserve Bank maintains in its press note that these 'revisions' "do not affect our assessment of the state of liquidity of the economy, or our approach to credit policy emphasising caution and restraint in use of bank money". This may be paraphrased, not entirely uncharitably, to mean that for the purposes of the Reserve Bank's credit policies, it is immaterial what the figures are. In fact, the Reserve Bank *only* makes a bad situation worse with pompous arguments such as that "in the interpretation of banking and monetary data, it is always more meaningful to bear in mind the levels of flows rather than the position at any point of time" — as if the former can be determined independently of the latter!

The Reserve Bank's explanation for the 'revision' of banking data are equally ingenuous. It is suggested that "with the rapid expansion of bank offices, the time needed for branch reconciliation work has become more and more difficult (*sic*), in a situation in which recourse to electronic processing of data is still limited". It is difficult to understand what the weekly returns of banking statistics have to do with branch reconciliation work or with recourse to electronic processing of data. Preoccupied thus with explaining away the situation, the Reserve Bank has glossed over the main reason for the confusion. The original confusion arose from the use of March 31 figures both for 1977 and 1978 when the figures for March 31, 1977 were based on a special return submitted by the banks (vide RBI *Bulletin*, November 1977) whereas the March 31, 1978 figures were last Friday figures based on section 42 returns. The Reserve Bank always uses the last Friday of March figures (based on section 42 returns) as the base for presentation of comparative statistics with respect to the current year and the preceding year until it gets the special March 31 returns, which it used to get about nine months after the beginning of the financial year. These special return figures for March 31 used to be generally published in the November issue of the Reserve Bank's *Bulletin* every year. This year the Reserve Bank chose to use the March 31 figures for both years, probably because the last Friday of 1977-78 also happened to be March 31. This was obviously inadmissible, at least until the revised March 31, 1978 figures were obtained, if not until a special return was obtained after the closure of the year-end accounts, particularly government accounts which tend to fluctuate rather widely and hence to distort banking variables around the financial year closing.

With the 'revised' banking data, the increase in non-food gross bank credit now works out to Rs 1,490 crores between March 1978 and December 29, 1978 as against Rs 1,064 crores during the corresponding period of last year (see Statistics section of this issue). Expansion of money supply (M1) during the same period works out to 9.2 per cent against 10.8 per cent last year. The Reserve Bank Governor had castigated bankers, at his November 1978 meeting with them, for the decline in the incremental ratio of credit expansion to the priority sectors during the current financial year upto October 1978, from 55 per cent in the previous year to 31 per cent. Now the incremental ratio is seen in fact to have gone up from 55 per cent to 59.2 per cent. All of which does go to show how much a game of numbers the whole business of helping the poor and the priority sectors has become.

The President

Very Special Concerns

PRESIDENT SANJIVA REDDY's broadcast to the nation on the eve of the Republic Day appears, at first sight, to consist of generally unexceptionable sentiments overlaid with a rather demonstrative concern for the 'kisan'. But on closer examination it appears to be replete with questionable propositions.

Take, for instance, the President's recourse to the now fashionable rural-urban dichotomy. According to the President, "in the welter of demands and agitations by the urban pressure groups for an ever-increasing share of the national cake, the needs of the poor farmer, the real producer of wealth in our country, are apt to be overlooked." A little earlier in his broadcast, the President had in the same vein called for "a radical change in the value system of our urban societies".

A most convenient vagueness permeates these references to the rural and urban parts of the country and the suggestion that the avariciousness of the latter is responsible for the poverty of the former. It is ignored that the so-called urban societies have their poor, scarcely less numerous proportionately than the rural poor. According to the government's own estimates, as much as 41 per cent of the urban population lived below the poverty line in 1977-78, compared to 48 per cent in the rural areas.

On the other hand, not everyone in the rural areas is a "poor farmer". Certainly, the top 4 per cent of rural households each with assets of Rs 50,000 or more who, as brought out by the Reserve Bank's All-India Debt and Investment Survey, owned nearly one-third of all rural assets in 1971-72, do not deserve the President of India's commiseration. Nor can they be lumped together with the bottom 20 per cent of households which among them did not own even 1 per cent of total assets.

The roots of the poverty of the overwhelming majority of the rural population must be sought not in the "demands and agitations by the urban pressure groups" or in the "value system of our urban societies", but in *property relations* in the rural areas themselves, which produce such acute disparities in the distribution of rural incomes and assets. In this context, has the President of the Union anything to say, for instance, about the possibilities of redistribution of ownership of land? No, he does not. On the contrary, the scope for any sort of land reform is played down on the plea that "because of the rapid growth of population, the pressure on available cultivable land is increasing and it will not be possible to provide land for all the landless". Since land cannot allegedly be provided to *all* the landless, why disturb the existing concentration of land ownership!

And what about the urban areas? Which precisely are the "urban pressure groups" that the President has in mind? Are they those who have managed in the last few years to secure steep reductions in the rates of taxation of their incomes, or those who have

engineered the flow of vast investments into the production of luxury goods and services, or those who have with the active assistance of government and the government-owned financial institutions further increased their control over productive resources in industry and business and who have used this control to systematically supplant traditional employment-intensive industries, whether these be coir, footwear, carpet-weaving or fishing?

No, it is evident that these are not the "urban pressure groups" that the President has in mind. By implication his reference is to the organised urban working class which has recently been the object of concerted attack by government and employers alike as "high wage islanders". The President of the Union may now be said to have blessed these attacks as already manifested in such measures as the Industrial Relations Bill and the government's refusal to negotiate wage increases in public sector undertakings where existing wage agreement have long expired. Advocacy of class interests is thus very clearly discernible behind the disarming sweep of the President's 'national' concerns.

Iran

New Confrontation

WITH the departure of the Shah from Iran, the confrontation between him and Ayotullah Khomeini seems to have given place to a new confrontation, this time between Khomeini and the Shah-appointed prime minister, Shapour Bakhtiyar, who is taking his 'Constitutional' legitamacy very seriously and insisting that he will continue to function within the 'fortress of the Constitution' and not abandon his charge to either Khomeini or to any other authority the latter might appoint. This development has not been entirely unexpected, for it is unlikely that the Shah would have chosen Bakhtiyar among all other opposition politicians in Iran to form a civilian government (and that Bakhtiyar would have been willing to be chosen) without some tacit understanding that the government thus formed would not be merely a transitional government.

But these posturings of being firmly within the fortress of the Constitution have very much the backing of another, ever present force in Iranian politics — the half a million strong armed forces. There have been many reports about the opposition of the armed forces to any 'softness' on the part of the Shah, and the swearing in of the civilian government, the appointment of a regency council and the departure of the Shah were all, at each step, opposed by this or that general. The army-instigated killings at Ahwaz, Dezful, Najafabad, Zahedan and other places where unarmed civilians celebrating the departure of the Shah have been fired upon are only the latest of these expressions of disapproval of opposition to the Shah.

This so-called pro-Shah backlash, and the reaction to it in the shape of mass resignations of members of parliament following the call by Khomeini (who has refused to recognise the illegal regime of Bakhtiyar and has announced the formation of his own administration) provide just about the most perfect situation for the generals to take over. In fact, Bakhtiyar has said that the only alternative to his government is army takeover; and Khomeini too has been saying in Paris that the Shah did indeed issue instructions to the army before he left Iran to stage a coup in the event of his (Khomeini's) return to Iran. The army's actions in closing all airports, blockading access to Tehran airport, and surrounding Iran Air planes which had been standing ready to take off for Paris to bring back the exiled leader are all of a piece and are intended to serve notice not so much on Khomeini (who has personal experience of what the Shah and his supporters could do to him) but on Bakhtiyar that any attempt to make a deal with Khomeini would invite the wrath of the army upon his own head.

The situation is thus poised for the next stage of the struggle in Iran, from the 'mass confrontation' expressed broadly through strikes and demonstrations, to actual civil war. The kind of expectations roused during the demonstrations and strikes, the kind of unity achieved, *albeit* in opposition to the Shah, by such disparate elements as those that comprise the opposition, cannot be killed by a mere military coup which anyway would be a formalisation of an existing reality. The real opponents of the Shah cannot experience any greater repression under a formal military takeover than what they have been accustomed to all these years. The immediate consequence of a coup may be a certain cooling off of the anti-Shah frenzy, especially of the kind that is being articulated by the petty bourgeoisie, the trading class, the lower levels of bureaucracy, etc. But it will also take the struggle to a higher plane and force the 'Islamic' elements to device altogether new ways of confronting a situation where whatever few constraints that existed which prevented the full might of the armed forces being turned on them would have disappeared.

An army takeover in Iran may also be welcomed by many powerful interests outside Iran. The most important of these foreign interests is of course the United States which has not even pretended to be neutral about developments in Iran. More recently, President Carter has tried to put on a brave face and pretend that Iran does not have such great importance in the strategic concerns of the US. But it is clear that any arrangement wherein oil supplies to Israel and South Africa (not to speak of supplies to the US itself, which gets about 5 per cent of its oil requirements from Iran) will be disturbed cannot at all be liked by the US. A more realistic assessment has been given by the managing director of Royal Dutch/Shell group who has said that there could be "a shambles" in the rest of the world if a strong Islamic government in Iran decides not to resume oil exports. A pointer to future developments is that Khomeini's call to the oil workers to keep up oil production to meet domestic demand — it is only his future plans of a regulated oil export that include stopping of oil sales to Israel and South Africa, and a cutback on exports to the level that Iran needed for oil revenues — has till now gone unheeded and even the special mission led by Mehdi Bazargan, a possible prime minister in a Khomeini directed regime, and having the backing of Khomeini, Shariat-Madhari and the National Front, has failed to persuade the oil workers to resume production.

Khomeini's views on oil production, foreign trade and foreign collaboration, international banking, all apparently clash with the broad strategic interests of the Western capitalist countries in Iran and it is no wonder that almost without any exception, they have been painting Khomeini as some kind of a 'fundamentalist' freak. But this is probably because of a lack of knowledge of what Khomeini and his 'Islamic' movement stand for — a lacuna which is being sought to be rectified by the CIA, which is reported to have undertaken a study of Islamic movements all over the world. After all, the US has the happiest of relations with the most Islamic of Islamic countries, Saudi Arabia, and such practices as public flogging and executions, amputations, and stoning to death of women accused of adultery have not disturbed in the least the conscience of a regime so outspokenly committed to the cause of human rights everywhere.

Myth of Capital Market?

IN your editorial "Myth of Capital Market" (*EPW*, January 6) you have chosen to miss the main point that the Seminar on the Investment Market was meant to deal with its prospects and problems. Its very object was to look ahead to the future growth and how that can be brought about. Admittedly, investible resources are presently in excess of demand but this is a short-term phenomenon and does not answer the long-term problem of how to augment supply of capital when demand picks up.

Nobody suggested, as you make out, that the capital market should be sustained with bank credit. What was made clear was that regulations of the Reserve Bank on bank lending against shares are outdated and need to be revised because they act as a constraint on the growth of the capital market by coming in the way of liquidity of shares. You forget that the examples of exploiting bank credit for questionable purposes have taken place despite the restrictive policy of the Reserve Bank. What is needed is vigilance on the part of the Reserve Bank and government to curb nefarious practices. It is for the common small investor that the credit restrictions against shares act as a constraint. There is often a wide gap between the ostensible purpose of a regulation and what it does in practice, which should call for periodical re-examination of regulations in force. This Seminar did not plead for any reduction in direct or indirect taxes and yet you charge it for that "crime". Lastly, do you really think that your long quotation from the Draft Plan had any relevance in this editorial? One is free to stick to one's self-righteous stand and preconceived ideas, but it does not follow that others' integrity should always be questioned.

Bombay, January 15. H T PAREKH

[When it was pointed out in "Myth of Capital Market" that the problem is not primarily one of lack of investible resources, but of absorbing in investment the resources that are available, the reference was not to the immediate situation, but to the long-term, structural constraints on productive use of resources arising from the relative narrowness of the domestic market which, in turn, is the product of the extreme disparities in the distribution of income and property. The quotation from the Draft Plan was in support of this point. The view that the excess of investible resources over demand "is a short-term phenomenon" is precisely what we have sought to caution against, since this view leads to suggestions for government action to "stimulate" the so-called capital market of a type (e g, further tax cuts and more tax incentives, bank lending against shares, etc) which in fact further distorts income and asset distribution and, therefore, aggravates the basic problem. — Ed]

Time to Make Choices

MAY I be permitted to offer a brief comment on the remarks of your anonymous letter writer ("Time to Make Choices", *EPW*, January 13)? There is a link between the issue of class relations and that of Centre-State relations. For consider your correspondent's demands: (a) rescind all indirect taxes, and (b) tax directly the rich more and more. A state government can of course rescind all indirect taxes falling within its ambit, but it has currently few powers to tax the rich. The representatives of the feudal and capitalist classes who drafted the Constitution had taken due precaution against the possibility of radical elements suddenly coming to power in a state and upsetting their applecart. It is only in the case of the rich peasantry that a state government can draw a stiff agenda of direct taxation; the Left Front government of West Bengal has already taken some steps in the matter. As far as taxing directly the rich capitalist and trading classes is concerned, the upper limit of a state government's power has been set by the Constitution at Rs 250 annually, or Rs 20.83 per month. It is because it is important for state governments to be able to put the squeeze on the richer elements in society that the government of West Bengal has been consistently asking for a realignment of Centre-State relations, including the existing fiscal arrangements. As long as these arrangements remain unaltered, to rescind all indirect taxes would imply a financially bankrupt state government, which would collapse immediately. Perhaps this is the devout prayer of your anonymous letter writer: a lot of hatred against the Left is sometimes noticed in quarters where the lingo is Left, often modishly so.

Calcutta, January 18. ASHOK MITRA

Government Policies and Industrial Sickness

YOUR Special Correspondent has highlighted a national malady in his article "Sickness in Industry: Role of Government Policies" (*EPW*, January 13).

Your readers may be interested to know that governmental policies do not stop merely at licensing of unwanted capacities; they go a step further. The sick child, after it is born, is fostered with all sorts of props, without any logic and disregarding public interest.

The raw material for manufacture of Borax, namely Sodium Borate, is entirely imported. There is only one supplier of Sodium Borate in the world, and two consumers in India, who use it for manufacture of Borax. The imports of Sodium Borate are canalised through the State Chemical and Pharmaceutical Corporation of India, in the name of procuring advantages of bulk buying, distribution, etc, when all that happens is a seven to ten per cent increase in procurement costs, and recurring delays in shipment! The matter has been referred to the Government of India, time and again, for decanalisation, but without any effect. Recently, the earlier established unit, referred to in your Special Correspondent's article, even offered to reduce the prices of the end product to the extent of savings brought about by decanalisation of imports (estimated at about Rs 300 per ton of end product), if imports are decanalised. This price reduction would have helped to attract marginal users, and increase the demand for the product, which would, in turn, have facilitated a higher capacity utilisation.

Can your readers believe that the Government of India has not agreed to decanalise the imports, merely because Company X and TIDCO have opposed the decanalisation? The latter's opposition to decanalisation is reported to be that if imports are decanalised the private sector unit will be able to arrange imports at prices cheaper than themselves, and that such an "advantage" should not be allowed to the private sector unit!

Bombay, January 19. A READER

Focusing on Perspectives

Romesh Thapar

IT is somewhat startling to see the comfort that the Janata party's agreements on leadership wrangles brings to its demoralised followers. In a sense, they are grasping at straws if only to reassure themselves. But, fundamentally, the relief is exaggerated because everyone knows that the in-fighting among the three old men has nothing to do with any difference of opinion on policy or programme. For this reason, too, no one knows how long the personality collisions will be prevented.

The discussions within the Janata party executive, held against the background of various 'peace-making' initiatives, yielded a twenty-two point programme (yes, take note, not twenty!). We are now expected to turn our attention to issues. This may happen to the extent that George Fernandes keeps pushing for certain structural changes, but it is a mistake to imagine that our free-wheeling politicians are interested in anything but the changing fortunes of their benefactors in the leadership — government and opposition.

The health of the economy notwithstanding, we are in the middle of a major strike situation which is paralysing the industrial areas of several cities and threatening to dislocate normal functioning across the country. The agitation by bankmen, already an aristocracy in the public sector, is seen by the public at large as blackmail. Not only have these bankmen earned a reputation for sustained inefficiency and lack of minimum responsibility, but they have managed over the years to brow-beat government into accepting all manner of demands which are now sought by other categories of the public sector. A growing resentment against these 'radical' manipulators is visible.

The conviction that this Janata government is incapable of resisting well-organised pressure — together with the threat of what are called 'sympathy' strikes — feeds the 'determination' of a working force that showed little signs of life during Emergency and which over the years has brought little credit to the public sector. The more thoughtful trade union leaders had better beware. Even the Janata government is capable of hitting back.

Something of the anger against trade union practices in the public sector is getting to our populist politicians. The reluctance to support moves for nationalising new categories of industry is rooted in our incapacity to resolve crises in the public sector and the political patronage that invariably goes to elements with little concern about productivity. All the rhetoric in the world cannot dissolve these impressions which are now very much a part of public consciousness.

The Janata party's approach to these complex problems, as illustrated by the Industrial Relations Bill, has come in for a great deal of stereotyped criticism at the hands of the trade unions. But it can no longer be denied that a large body of political/bureaucratic opinion in the country is convinced that the present anarchy cannot be allowed to prevail, that it spells the kind of disaster which authoritarians seek in order to suspend democratic functioning. The trade union leadership will have to view its activity in the totality of democratic functioning.

This may well happen in the course of this year's tribulations. More intensive discussions with the trade unions, the presentation of alternative settlement systems, the study of various participative experiments, and the intensification of work in the long-neglected personnel area of management, might create the kind of relationships in industry which make the disruptors and blackmailers powerless. Without this effort, there can be no forward movement.

It is in contexts such as these that so much time and attention is given to the resolution of the political tangles of the Janata party. A 'leader' is not sought. Nor that wretched mess called 'charisma'. The country is looking for a certain degree of political coherence which will make possible the sketching of some kind of perspectives, political and economic, for the restructuring of our vast federal politiy. The Janata party's performance in this respect is dismal.

Whether there are one or two deputy prime ministers, or whether Charan Singh lands in Finance or Agriculture, is of little concern. The public is fast realising that the elaborate civil and military system of the sub-continent is capable of functioning effectively without political direction for a limited time only. Endless squabbles at the top cannot but disrupt decision-making and have to be brought to a halt. And patch-ups can be frustrating, too.

In other words, despite the comforting words of Morarji Desai and Chandrasekhar, there are no easy solutions for the Janata party. Either it functions as a party with a system of accepted discipline or it threshes out some kind of coalition framework for the Centre and for the states where it rules.

Maybe, the current wave of industrial unrest will help us to get perspectives in better focus. Great injustices have to be corrected, but irresponsibilities have also to be nailed. The Janata government at the Centre has the skills to settle these issues, but the old men of the party have to act unitedly and in support of those physically dealing with the problem. So far, attitudes have been casual or too heavily biased by old rigidities. Every one needs a shaking.

In some such mood, we watch the developing situation, full of expectations.

January 22

Bombay Dyeing

BOMBAY DYEING has offered redeemable debentures aggregating Rs 2.5 crores to its shareholders on a rights basis in the proportion of one debenture of Rs 100 for every eight equity shares held. The additional finance is being raised by the company to meet its working capital requirements. These debentures will carry interest at 11 per cent per annum, payable half-yearly, and will be repaid in five equal annual instalments commencing the eighth year. The debentures will be quoted on the Bombay stock exchange giving them the desired liquidity. The company is also seeking approval of the government of Maharashtra for declaring the debentures as an 'approved security' for investments by charitable trusts. In case of temporary needs for funds, the debenture-holder can hypothecate his debentures with any bank for purpose of obtaining cash credit or overdraft facilities. Moreover, the company has reserved its option at its sole discretion to repurchase the debentures. The company's equity share of Rs 25 each is currently being quoted in the market at around Rs 116.

Stalled Diversification

Hansavivek

INDIAN OXYGEN's non-resident shareholding is being reduced to 40 per cent under FERA by the parent, BOC International, disinvesting 21,60,440 shares in the company through an offer for sale. This is being done in the absence of government approval of any worthwhile expansion or diversification project which might have justified a new capital issue. The company had submitted a major diversification project for manufacture of a range of castor based chemical products some 4½ years ago, but a final decision thereon has yet not been communicated to it. In the meantime, substantial changes in the world market conditions have made it uncertain whether the project would be still viable. The chairman, K D Moore, says that the company, which is no longer foreign controlled, will continue efforts to seek worthwhile opportunities for branching out into other fields in which it can use its technologies, knowhow and management expertise to advantage. He, however, emphasises that it will continue to give first priority to the sustenance and health of the existing main businesses which remain essential to its long-term well being. The company's application for an industrial licence for setting up a new factory at Barbil, in Orissa, for manufacture of liquid oxygen explosives has been recently rejected. The management intends to make a final representation to the industry minister shortly in view of the urgent need for explosives in the country. The company has also applied for government approval for manufacture of continuous welding consumables and submerged arc welding fluxes at the Ambattur factory. The project involves use of technology developed within the company and there is a rising domestic demand for these products, which are used in the sophisticated automatic welding processes being increasingly required in metal fabrication.

The company has suffered a setback during 1977-78, following lower volumetric sales of most major products on account of severe power shortages in some parts of the country, industrial unrest affecting customers' activities especially in the west and the south, and a demand slack in certain sectors of the economy. Loss of production and increased operating costs from power interruptions and shortages have caused loss of profit by more than Rs 80 lakhs. This loss in conjunction with substantial increases in materials and employee costs could not be fully recovered in higher prices and brought a marked deterioration in working results after the improved figures of the two previous years. The directors have recommended a final dividend of 3 per cent making a total of 15 per cent on the enlarged capital base resulting from the last bonus share issue. This will require the same quantum of distribution as in the previous year and is still adequately covered by earnings.

The gases division introduced addi-

tional products required by some vital industries. Production from the hydrogen plant at Asansol commenced towards the end of the year. There has been some delay in the installation of the argon purification plant at Jamshedpur, which is now expected to be commissioned during the second quarter of the current year. The welding and engineering products division installed a newram extruder at a cost of Rs 23 lakhs to give increased impetus to the production of special electrodes. A generator is also intended to be installed at Khardah shortly to reduce dependence on public power supplies. The division introduced several types of low hydrogen and stainless steel electrodes, two sophisticated cutting machines, special purpose gas regulators and new models of medical apparatus including stainless steel Boyle anaesthetic machine. The company has obtained approvals for extending the range of medical products by taking up manufacture of ward vacuum units and incorporating a respiration control device in its anaesthetic apparatus.

WEST COAST PAPER has produced much better results for the year ended June 1978 because of favourable market conditions which enabled it to fetch more remunerative prices compared to the previous year. Production was higher at 53,338 tonnes as against 51,578 tonnes of the previous year and although sales volume was lower at 52,761 tonnes against 55,608 tonnes, net sales realisation was more at Rs 19.68 crores against Rs 18.51 crores. Profit margins expanded noticeably and gross profit advanced from Rs 1.92 crores to Rs 3.28 crores. Net profit was also considerably higher at Rs 106 lakhs (Rs 65 lakhs) and dividend stepped up two points to 12 per cent was covered 1.81 times. These results were obtained in spite of a 55 per cent power-cut throughout the year, unsatisfactory supplies of bamboo and coal and increase in other cost inputs. As no additional forest areas have been allotted by the government of Karnataka, the company is trying to obtain supplies of bamboo from Assam, Orissa, MP and other states at higher cost to supplement supplies from the concessional areas. The availability of coal remained difficult throughout the year. The company had to keep one of its paper machines shut for some days and at times the whole mill was shut for want of coal. There were frequent work stoppages and also an "illegal" strike by a section of labour in September last which resulted in a lockout for four days. The management is making efforts to improve industrial relations. The Kali hydel project, which was expected to start supplying power in mid-1978, is delayed by about a year. When this project goes on stream, the power situation will improve. The company has placed an order for a chemical recovery boiler with ACC-Vickers-Babcock of 330 tonnes black liquor solids per day capacity. After its installation, chemical recovery will improve which will help in reducing the pollution and generation of additional steam will be utilised for power as well as process. The boiler is expected to be commissioned by mid-1980. The company has taken in hand the project of effluent treatment, costing nearly Rs 88 lakhs. In accordance with the new order issued by the Central government, the company is required to manufacture, apart from 30 per cent white printing paper for supply against allocations made by government at a price of Rs 2,750 per tonne, 33 per cent of other writing and printing varieties, out of which 20 per cent should be of creamwove. The directors say that this will restrict production of other profitable varieties of paper.

TATA MILLS has shown a distinct improvement in its working during 1977-78, with a quick turn-round from a net loss of Rs 91 lakhs to a profit of Rs 53 lakhs, following higher net sales of Rs 26.68 crores against Rs 22.62 crores in the previous year. The directors have proposed payment of preference dividend including arrears from January 1, 1975. After making certain adjustments, the carried forward loss has been reduced from Rs. 1.98 crores to Rs. 1.62 crores. This encouraging picture has emerged as a result of increased operating activities and unit value of product and reasonable cotton prices even though the company's operations continued to be hampered by difficult liquidity position and increased interest burden. Considering the financial requirements of the company, it is proposed to extend by 12 years the date of redemption of the existing 30,000 preference shares of Rs 100 each to January 1, 1992 by increasing the rate of dividend from 9.5 per cent to 11 per cent per annum. The company's application for a soft term loan to IDBI for modernisation and rehabilitation of its plant facilities is examined by the consortium of government financial institutions. The proposal covers some finances for meeting pressing liabilities also, along with finance for machinery and equipment rehabilitation. The company installed plant and machinery worth Rs 26 lakhs during 1977-78. It is considering some investment to increase production of the non-woven division which has reached its peak capability.

SEHGAL PAPERS is offering to the public for subscription 33 lakh equity shares of Rs 10 each for cash at par. The subscription list will open on February 5. This public issue is being made to finance the company's Rs 17.40 crore project for the manufacture of various types of papers with a total licensed capacity of 30,000 tonnes per annum — writing and printing paper (9000 tonnes), paper and paper boards including soft tissue and its products (10,000 tonnes) and one time carbonised paper/carbon-less copy paper (10,000 tonnes). The company has been promoted by M M Sehgal, a non-resident Indian, with about 20 years' experience and business operations in Taiwan, Japan, Hong Kong, USA and India. The company has entered into a technical collaboration with Nashua Corporation of USA which will provide the latest technology in the field. The Company has received technical assistance from Stafford Machinery Corporation of USA for the erection and start of soft tissue plant and equipment. The total project cost is to be financed by an equity share capital of Rs 565 lakhs, term loans/loans from financial institutions and banks of Rs 1159.90 lakhs, central cash subsidy of Rs 15 lakhs, and unsecured loan from promoters of Rs. 10 lakhs. Out of the equity share capital, the promoters have taken up equity shares of the value of Rs 226 lakhs with an additional commitment of Rs 35 lakhs in the public issue. The project is located at Sehga Nagar, about 52 km from New Delhi lying in a backward area in Haryana. The Company has already been sanctioned sufficient power by the state electricity board, but has made arrangements for complete captive power generation to run the entire plant to ensure uninterrupted production in the event of power failure. The company has already imported all necessary machinery and its plant has gone into production of soft tissue and MG tissue paper. Production of writing and printing paper has also started. Trial runs of carbonless copy paper is expected to start in February, 1979.

LABOUR

Struggle Continues at Dalli-Rajhara

IT is over a year and a half since the happenings of 1977 at the Dalli-Rajhara mines in Madhya Pradesh — the midnight arrest of Shankar Guha Niyogi, leader of the Chattisgarh Mines Shramikh Sangh (CMSS), the killing of 12 persons when the police fired on workers protesting against the arrest, and the 55-day strike of workers. Most of the workers' demands were accepted, when the union, management and contractors arrived at a shaky truce, and work was resumed on November 2, 1977. But this truce is already threatened by the prospect of another major strike.

The workers' demands this time are mainly three — first, that the contractors revise the norms and minimum wages for loading and unloading of iron ore, which have remained unchanged since 1974; second, that the management scrap the outdated Iron Ore Wage Board and pay wages as prescribed by the Steel Ore Wage Board, and third, that the government's plan to start the Kondey mechanised mines, which will mean retrenchment of at least 10,000 workers, be given up. Shanker Guha Niyogi and Chabbi Lal, vice-president of the union, are now on a hunger strike over the first demand.

Though the call for a general strike has not yet been given, production has considerably slowed down and, in some areas, completely stopped. An ultimatum has also been issued that if the matter is not resolved within a specified period, the contractors will be tried by a "People's Court" and forced to abide by its decision. Niyogi is confident that the workers' demands will be met before this drastic step is taken.

Last year was a deceptively calm one in Dalli-Rajhara. But behind the scenes, the CMSS further consolidated its position as the leading union in the mine belt. Within the union too, revisionist elements were purged. A series of relatively small struggles were taken up and the establishment was continuously reminded that, though the workers were relatively quiet, they could no longer be taken for granted.

Guha Niyogi sees the latest struggle as "the last battle waged against the contractors". He says, "With this their power will be completely smashed once and for all, and we come directly under the management's control." The site of the struggle has also been shifted from Dalli-Rajhara to Kusumsh Kussah. It was here that the contractors first arrived from Rajasthan. Starting as petty merchants they amassed a huge fortune at the expense of the local tribals, mostly Gonds and Halwis. With the coming of the iron ore project at Dalli-Rajhara, and quick to perceive their opportunity, the contractors established contact with the government officials as well as the Bhilai steel plant management. Gradually they assumed control of four of the six mines in the area and over these mines their stranglehold had been unshakeable till now.

The change in venue is also to set an example to the local villagers. The villagers, many of whose children are in the mines, are themselves being exploited by relatives of the contractors. A pink triple-storeyed house, complete with airconditioners and two garages, is eloquent testimony to the prominent position of the contractors in the village. Just now the doors are barred and the shutters and curtains tightly drawn as the contractors have temporarily fled, in the face of the workers' agitation. The servants left behind by them have also deserted. A detachment of disinterested-looking policemen stand guard by the house, while a couple of plain-clothesmen loiter near the tent where Niyogi and Lal are on hunger strike on the pretext that they were there for Niyogi's "safety".

The issue of revising the norms and minimum wages for the loading and unloading of iron ore is a long-standing one. It had figured in the 55-day strike of 1977. The norms fixed for an 8-hour working day is 8 tonnes and the minimum wages for this is Rs 12, Rs 9.85 for loading and Rs 2.15 for unloading. During the Emergency, the wage for unloading was taken away, and workers began to be paid only for loading, though they had to do both tasks. After the 1977 struggle, the contractors agreed to give a rise of two paise per ton for loading (from Rs 1.23 to Rs 1.25) and a lump sum of Rs 100 as compensation for the payment of which workers were deprived during the Emergency. Assurance was given that the norms would be immediately revised and the wages paid for unloading also. But the contractors did not keep their word. Instead, they threatened to raise the norm from 8 tons to 11.3 tons, while keeping the minimum wages at Rs 12. The workers at once protested and demanded that the norms be corrected and the minimum wages paid in full. When the contractors refused, Shanker Guha Niyogi, Chabbi Lal and the secretary of the Union went on hunger strike.

Both the government and the Steel Authority of India Limited (SAIL) have agreed orally to pay the workers as per the recommendations of the Steel Ore Wage Board. The Union, however, wants the agreement in writing. Talks on this issue were to start on January 7 and the Union is keen that the struggle against the contractors is finished before these discussions begin. The workers stand to gain an increase of as much as Rs 150 in their basic salary if they are paid according to the Steel Ore Wage Board. They will also get house rent and transport allowance, which they are not getting now.

In one sense, the workers' problems are just about to begin, as the government intends to construct the Kondey mechanised mines, as a result of which 10,000 workers will lose their jobs. This project was conceived before the Janata party came to power and now the government has nearly Rs 80 crores worth of machinery on its hands. Understandably, the minister for steel, Biju Patnaik, has said that he can do nothing but go ahead with the scheme. In reply, the CMSS has come up with an alternative scheme after a detailed study. The scheme proposes semi-mechanisation of the mines keeping in mind the basic aspects of mechanisation — increase in productivity and quality control. While drilling, excavating and loading of the iron ore will be done manually, the product will be sifted and sorted out mechanically. This will not only ensure quality control, but also reduce production costs by nearly 25 per cent, for raising the iron ore to the surface mechanically is extremely expensive. The miners' working capacity will also be increased. Now each worker has to do the entire range of operations from drilling to cleaning the ore, but under the CMSS scheme the ore has only to be raised and the rest is done mechanically. The machinery already acquired can be easily shifted to other existing mechanised mines without much difficulty.

The CMSS from now onwards plans

focus its attention entirely on the al areas. Except for a skeleton team, main efforts of the union will be centrated on mobilising the villagers issues such as getting their land ck from non-tribals, seeing that the est products are sold at a proper ce and procuring drinking water and igation facilities. Says Niyogi "What have been aiming at in the mines been to a great degree achieved. most of our struggles we managed isolate the enemy, and tackled them e by one. First it was the contrac- then the management and finally government. We did not take them all at the same time — while we re struggling against one enemy, we to it that the other two were kept ased and undisturbed. Not only this, also did not give them any respite m the pressure which was on at all es. The moment the struggle with contractors was over, we immedia- y switched to the management and ewise the government. The esta- shment thus had little time to chart t fresh tactics and was always on the 'ensive. The broad unity that we re looking for in the mines has also been got. But for a few pockets here and there, the majority of the workers are CMSS members. Further unity can be found only in the countryside and it is time to bridge the gap between urban and rural workers."

Though the Union will be functioning mostly in the rural sector, the members will continue to work in the mines for their livelihood, except for Niyogi, who plans to leave the mines and settle down in the village. "New strategies will have to be drawn up, as the situation in the mines is different from the village. In the village the moment has come, unlike in the urban sector, to reply force with force. But before things come to that they will first have to be organised." The union also plans to build schools and hospitals for the workers and the villagers. There are hardly any schools in the area, and the government hosital rarely has any medicine. The hospital set up by the management seldom treats workers. "We want to do something constructive and concrete and set an example before protesting about the lack of facilities, or all we will be doing is shouting empty slogans."

SAM

Barriers to Rural Development

Joykanta Sarma

IAT the economy of rural Assam, elsewhere, is still dominated by dlords, and that the fruits of mo- n technology, if any, have not ie to the small and marginal far- rs, has once again been confirmed, cially. A micro-level study on ru- development and strategy for ac- n with regard to four Gaon Pan- yats of the state — Nischinta- in Cachar district, Barpujia in wgong district, Pub Tamulpur in mrup district and Panidihing in sagar district — conducted by the w moribund Rural Development ject under the State Planning De- tment makes all the points. It says it a strong commitment to rural elopment at the policy making el and conscious efforts at the ro-economic plan formulation are led for. This should include, it has n stressed, more fund allocation rural areas; implementation of the d reform measures on a priority is; flow of field tested technical owledge, availability of extension vices, support services, facilities for rketing, storage and credit etc.

The Nischintapur report reveals that 14 per cent of the households own 56 per cent of cultivable land, while 36 per cent of the households own no land. The remaining 50 per cent own 44 per cent of land. There is a predominance of uneconomic holdings, lack of opportunities for subsidiary occupations and consequent unemployment and under-employment which is involuntary. There is a very large primary sector, with 81 per cent of the population being engaged in agriculture, and a very small secondary sector with only 1.5 per cent worker engaged in it. The per capita availability of cultivable land is 0.08 hectares as against the district average of 0.13 hectares.

Overlapping with the scheduled caste population are the marginal farmers with landholdings of less than 8 bighas who represent 30 per cent of families. Landless agricultural labour constitutes 36 per cent of the families. Over 80 per cent of the population is below cut off point with per capita monthly consumption expenditure below Rs 40.

Another constraint to agricultural development is the semi-feudal share cropping system which is anti-productive and anti-modern, with the owner unwilling and the sharecropper unable to make investment for improvement.

There is general lack of agricultural credit from the institutional sources. In the absence of long-term credit, the farmers cannot make investment on land for better agricultural operation. Lack of medium-term credit obstructs supplementing of their farm income by subsidiary business. Lack of short-term credit prevents them from adopting improved farm practices. The supply of credit is virtually nil.

Landless agricultural labour which mainly consists of surplus and casual tea garden labour, ex-tea garden labour, scheduled caste population, fishermen, etc are the weakest segment of the population. They are mostly day labourers and get wages below subsistence level during the lean periods.

The farmers, particularly the small and marginal ones, are dependent on low value crops, mostly paddy. High value crops like vegetables, chillies, turmeric and sugarcane are not cultivated for various reasons such as lack of irrigation facilities; inability of the farmers to make initial investment on current expenses to raise high value crops; greater incidence of risk involved due to fluctuation of prices; and lastly, marketing problems. The quantity produced by the small and marginal farmers is not-sufficient to market profitably. They have to sell through the itinerary agents of the wholesalers. There is also the *Dadan* system under which the traders make advances to the farmers at the time of distress and the farmers have to sell at a pre-committed price which is much lower than the market price.

There is high incidence of indebtedness. Out of the 3,203 households, 943 households (30 per cent) were in debt as in 1975 with original debt of Rs 7.18 lakhs. (The actual indebted families might be a little over 40 per cent.) The repayment of debt during 1975 had been only Rs 0.08 lakhs leaving an outstanding debt of Rs 7.11 lakhs. The outstanding debt per bigha of cultivated land owned by indebted households is Rs 185. 88 per cent of loans were borrowed from village money-lenders, 6 per cent from relatives and the rest from the

banks and co-operatives. 18 per cent of the households mortgaged out land measuring 300 bighas. In most cases, the term of mortage is that at the end of the stipulated period if the money involved in the deal is not returned, the land will be transferred to the money-lender by a clear sale deed. The office holders of the gaon panchayat and co-operatives belong to the well-to-do class.

The report on Barpujia too indicates that serious imbalance in land holding structure exists in the panchayat area. 66.5 per cent of cultivable land is held by only 29.2 per cent of the households as against 33.5 per cent of land by 70.8 per cent of the households. Of this 70.8 per cent of the households, 14.5 per cent do not possess any land at all.

There is an unusually large primary sector comprising 89.2 per cent of the working population. The pressure of population on land is therefore excessive, the per capita availability of cultivable land being 0.95 bigha. This lopsided economic activity coupled with heavy incidence of uneconomic holdings, lack of opportunities for subsidiary occupations has resulted in widespread unemployment and consequent poverty.

The per capita income of the panchayat area is calculated at Rs 29.75 per month. But the real depth of poverty cannot be gauged by the average figure. A large segment of the population representing 56.3 per cent of the total households comprises the marginal farmers within the size-class of landholding 0.01 to 7.99 bighas. The per capita income of this group is as low as Rs 25.67 per month. More appalling is the living condition of the landless people who belong, by and large, to the scheduled caste and scheduled tribe communities and are exposed to exploitation and oppression by the group economically better placed. Incidentally, with per capita consumption expenditure of less than Rs 40 per month, 83 per cent of the total population of the area is ranked below the 'cut-off' point.

There is high incidence of indebtedness. More than a fourth of the households are found to be in debt in some form or other. The outstanding debt per bigha of cultivated land has been computed at around Rs 90. Of the total debt of Rs 4 lakhs and odd, 70.8 per cent has been borrowed from the village money lenders as against 20.3 per cent from co-operative societies and a nominal 8.9 per cent from the gaon panchayat level Co-operative Society.

The level of technology in the field of agriculture is, by and large, traditional. The farmers entirely depend on human labour and weak animals for cultivation and they have no irrigation facilities.

Problems relating to Panidihing Panchayat area are more or less similar to those of the above-mentioned areas. There is serious imbalance in landholding pattern, with 45 per cent households owning 74 per cent of cultivable land while 9 per cent of the households own no land. The remaining 46 per cent households own 26 per cent of land. Here too, there is a very large primary sector with 92 per cent of population being engaged in agriculture. Consequently, there is excessive pressure on land and widespread poverty. Per capita availability of cultivable land is 0.16 hectares as against the district average of 0.22 hectares. 70 per cent of the population are below the poverty line with per capita monthly consumption expenditure below Rs 40.

Here also, an important constraint to agricultural development is the semi-feudal share cropping system. There is a general lack of agricultural credit from institutional sources. There is also high incidence of indebtedness. Out of 1,901 households, 172 households (11 per cent) were in debt as in 1975 with original debt of Rs 1.31 lakhs. The repayment of debt during the year 1975 had been only Rs 0.01 lakhs leaving outstanding debt of Rs 1.30 lakhs. The outstanding debt per bigha of cultivated land owned by indebted households is Rs 127. Out of these debts of Rs 1.31 lakhs, Rs 1.23 lakhs (93 per cent) was borrowed from village money-lenders and the rest from the banks and cooperatives. The actual state of affairs is perhaps even more dismal.

A similar imbalance in land ownership structure, low incomes, unemployment and underemployment and widespread indebtedness is revealed in the report on Pub Tamulpur. Further, since the area was declared as a tribal belt in 1949, the non-tribal inhabitants of the area, the immigrants of the post independent period, are not getting ownership rights despite their cultivation of land for more than two decades. The level of consumption of the population is below cut-off point with average per capita monthly consumption expenditure being Rs 30.73 only.

Pub Tamulpur has one feeding centre under the sponsorship of the World Health Organisation. In the lean season the children of the poverty-stricken people crowded the feeding centre. As a matter of fact, one centre is quite inadequate to feed them all.

These four sample reports are quite representative of the rural areas of the state. While some of the suggestions put forward in the reports are no doubt well-meant, they do not throw any light on how to overcome the more basic problems. No one knows if the much-talked-of micro-level planning, even if properly implemented, would solve the basic issues under the present structure.

Tea Pluckers: Limits of Distant Concern

(By a Special Correspondent)

THERE was quite a flurry of interest in the British media in the conditions of work of Indian tea-plukers last month. The occasion was the Annual General Meeting of Brooke Bond Liebig, the British multinational which not only owns Brooke Bond (India) — tea blenders and packers — but also has majority shareholdings in three Indian tea growing companies — Assambrook and Doom Dooma, in Assam, and Tea Estates (India) in Tamil Nadu. A resolution had been placed on the agenda, a resolution startlingly different from the normal run of humdrum business which is conducted at these glossy affairs (in which the shareholders gather to congratulate their directors and to enjoy free hospitality provided by 'their' company). The resolution called for significant steps to be taken to improve the conditions and wages of the company's employees on its tea estates in India. After half an hour of discussion, the resolution was voted down on a show of hands. The Chairman, Sir Humphrey Prideaux, announced that the proxy voting would have produced the same result, with 51 million votes against, 2.7 million for.

The resolution had been proposed on the initiative of the World Development Movement, a political pressure group focusing on Third World concerns. WDM started in the early 1970s, partly as an offshoot of the aid charities (Oxfam, Christian Aid) who were increasingly convinced of the need for political and trading/economic changes before serious improvements could be

made in the life-chances of the people they were trying to help. With most of its funding from the churches or from Oxfam, WDM is, not surprisingly, a reformist, left-wing/liberal organisation; most of its members, in 150 local groups, are middle-class and semi-intellectual in character.

WDM took up tea as a classic example of unjust commodity relationship after 1975. Tea is a good case study for Britain, still the world's largest export market, because it is familiar to all Britons and is still in a form recognisably close to the raw product (unlike copper, for example, which is processed beyond recognition). Public interest had been generated by a TV programme in 1973 and by a report in 1974 produced by War on Want; but War on Want dropped the issue thereafter. Brooke Bond is the natural target for political action, because of its dominance in the British market and elsewhere — it is the world's largest tea company, with large shares of retail markets in Europe, Australia and North America, as well as estates in India and East Africa. In terms of production it is small fry amongst Indian producers, at about 9th in the ranking of British companies, with 3 per cent of total production. But its public prominence means that British people take notice, when they would not bother with bigger producing companies — Lawrie Plantations, for example.

So WDM has tried to put across messages about unequal exchange, about the exploitation of poor workers, about the need for a New International Economic Order and an International Tea Agreement, and has canvassed MPs and the government towards these ends — while also doing similar work on other issues and commodities, providing critical, well-researched position papers on the Lome convention and the Common Fund, the development policies of the British political parties and so on.

The tea campaign brought out some of the strengths and weaknesses of these strategies. The simple message — tea pluckers earn little better than starvation wages — probably got across to some people, either in newspaper reports or in special radio programmes and interviews. The further idea that a higher price for tea would be a necessary (but by no means sufficient) way to improve those conditions, might have got through to a smaller number. But the more complex issues — the role of multinational corporations, the reasons for the weakness of the local unions, relative wages vis-a-vis other Indian workers, the reasons for conflict amongst the countries who might benefit from an International Tea Agreement, the strengths and weaknesses of welfare benefits provided by paternalistic (perhaps) companies, or the nature and effects of Indianisation in favour of local capitalists rather than nationalisation or collectivisation — none of these will have been communicated to more than a handful of people, already familiar with the general issues and sympathetic.

But of course, actions like this rapidly throw up issues which cannot be handled in Britain but in India. Once Sri Lanka had nationalised its estates, the impetus for political action in Britain was reduced, because the conditions of estate workers became the concern of the Sri Lankan government. It is more difficult to make a case for the responsibility of British companies when they are two steps removed from the workers, even though the controlling influence of British marketing companies and the London market undoubtedly restrict the potential for action by the Sri Lankan government. What worries British liberals is that nationalisation in Sri Lanka has made little discernible difference to the Tamil pluckers, whose conditions have changed little in spite of massively higher tea prices since 1975. Though the Indian situation is undoubtedly different, with the ethnically distinct pluckers in Assam not under direct threats of repatriation or violent attack, nevertheless there is unwillingness to argue in favour of nationalisation by the Indian government. It is suggested that nationalisation would lead to a siphoning of profits to Gauhati or Madras — little better for the workers than the policy of Indian capitalisation now being pursued.

So these campaigns illustrate some of the classic dilemmas of the Western liberal. Tea pluckers may not be the most 'deserving' of the poor — they are certainly not the poorest — yet they are amongst the most newsworthy. Reform within the structure of existing patterns of ownership and control will permit the liberal Westerner to maintain his interest, and his belief that he can achieve some change. It can even be argued that some classic cases of exploitation are useful educationally. But the liberal also knows that the existing structures are in fundamental ways the causes of the problems which he is concerned about, and that radical political changes in countries like India are essential if solutions are to be found. But any such changes must be fostered and controlled in India, and the liberal can do little more than cheer from the sidelines — and hinder his own government when it tries to intervene. Campaigns like the tea campaign may help to do that, in the long run, even if in the short run all WDM can point to are signs of hectic activity by Brooke Bond managers and some publicity as indicators of 'success'.

South Asian Studies in Europe

Report of a Conference

Imtiaz Ahmad

THE fifth European Conference on Modern South Asian Studies was held this summer under the auspices of the Centre D'Etudes de L'Inde et de L'Asie Du Sud and Centre National de la Recherche Scientifique, Paris, at Severes on the outskirts of Paris. The central theme around which the conference was organised was 'South Asia: Tradition and Change', but the papers prepared under this broad theme had been distributed into twelve separate, sharply focused and thematically integrated panel sessions. These twelve sessions were as follows: The Nature of State Power in South Asia, South Asian Communities Overseas, South Asian States in International Politics, Literature and Oral Tradition in Post-Colonial South Asia, Science and Technology in Indian History, Nutrition and Health Services in South Asia, Anthropological Approaches to the Political Dimension, Islam and Economic Activity and Development in Modern South Asia, Ritual and Society, Labour History of Pre-Independent India, Tribal Communities in Modern South Asia, and Christian Missions and Indian Society. Altogether over 133 scholars — European, South Asian, American and Australian — drawn from disciplines as widely different as theology, nutritional science, history, political science and sociology participated in the five day conference.

Over the years the European Conference on Modern South Asian Studies has grown into a large gathering and naturally produces a large crop of papers. Nearly 75 papers were submitted for the conference this time, and the standard of most of the papers was extremely good. In the panel session entitled 'The Nature of State Power in South Asia', Kersten Westergard's 'Local Politics in its relation to State Power in Bangladesh', D Kantowsky's 'Sarvodaya and State Power: Theory and Practice in South Asia' and Zins' 'Hegemony and Dominance: The Congress System' were particularly good. Zins' paper contained many ideas which offer excellent leads for understanding the nature of recent political changes in India. Violette Graff's paper on Communal Relations in Indian Politics in the same panel was also good and contained some interesting suggestions towards understanding electoral processes in constituencies having large minority votes.

There were several good papers dealing with the trials and tribulations of South Asian communities settled abroad in the panel on South Asian Communities Overseas. Evers' paper on Chettiar Money Lenders in South-East Asia, Mohan K Gautam's paper on Surinamese Hindustanis settled in the Netherlands and those by A Lambelle, J Kramer and V S Khan were particularly sound contributions. The study of overseas South Asian communities has traditionally been centred on South Asian populations in Africa and the United Kingdom, and little work on South Asian communities settled in continental European countries has so far been done. As several of the papers presented at the panel dealt with South Asian communities settled in continental European countries, particularly Norway and the Netherlands, we hope that these studies would enrich the perspective on the experiences and problems of the Overseas South Asian communities and bring the role of the contextual differences in their situation into sharper focus.

One of the principal attractions of the conference was the panel on Anthropological Approaches to the Political Dimension convened by Louis Dumont. As could be expected, it brought together an extremely large number of excellent papers dealing with rural leadership, political dominance, local politics, and kingship and divinity, etc. Particularly notable among the papers presented at this panel was the contribution by Marc Gaborieau entitled 'On Traditional Patterns of Dominance among South Asian Muslims'. It traced the consequences of the unique cultural tradition and minority political status of a population for dominance in a predominantly Hindu environment and provided a framework for the analysis of South Asian Islam. Gaborieau's suggestion was that the remarkable facility of Islam in winning adherents and achieving survival and stability in culturally diverse settings owes itself to the fact that Islam does not prescribe a rigid way of life. Every Islamicist may not agree with this view, but it is nevertheless an innovative hypothesis which requires systematic exploration.

Equally rich was the crop of papers presented at the panel on Ritual and Society. A W Van der Hoek's paper 'The Goddess of the Northern Gate: Cellatamma as the "Divine Kshatriya" of Madurai', Ronald Inden's contribution 'The Ceremony of the Gift (Mahadana): Structure and Historical Context in Indian Ritual and Society', G D Sonthmeir's paper on Some Incidents in the History of the God Khandoba and M S J Zanen's paper 'Garden of Adonis in the Mediterranean and in South India: A Comparison of their Structure' were particularly notable contributions. Van der Hoek's paper raised controversial issues in several respects, but at the same time it also offered a refreshing approach to the study of religion. Specialists of Comparative Religion will find the paper particularly innovative.

D Bernstroff's panel session entitled 'The South Asian States in International Politics' too produced several good papers and a lively discussion. D Braun's paper 'International Aspects of a Constellation in South Asia: India's large domain of action' and Christine Hurting's insightful contribution on 'Indo-American Relations since 1971: the Myth of the Middle Power *versus* Great Power Theory' were particularly good contributions and brought out several significant features of the contemporary structure of international relations in the South Asian region and India's significant place in it, S P Mallah's 'The Himalayan Kingdoms, Nepal, Bhutan and Sikkim: the Politics of Survival'. D Weidemann's 'Trends in the Development of Pakistan's Foreign Policy in the 1970s, and their background' and A Lamballe's 'India and Sri Lanka: Relations Between a Subcontinent and an Island' reinforced the crucial role of India and the emergent processes in the structuring of international relations brought out by Braun's and Hurting's thoughtful analyses.

Peter Hardy's panel on Islam, Economic Activity and Development in South Asia once again brought out the point that South Asian studies have been largely concerned with the study of the predominant Hindu tradition and the study of other religious traditions has not attracted the attention that it deserves. The number of papers presented at the panel was quite small. There was a good paper by Mumtaz Ahmad in which he analysed the attitudes of the *ulema* towards economic development in Pakistan. It contained many significant leads for discussion. Unfortunately, however, it was submerged by the highly controversial contribution by Theodore P Wright entitled 'Muslim Mobility in India through Peripheral Occupations: Music, Sports, Cinema and Smuggling'.

Wright, a perceptive student of Muslim Politics in India, presented the thesis that the Muslims in post-independence India were experiencing a blockage of avenues for social mobility on account of widespread social prejudice against them and this was leading them to seek social mobility through peripheral occupations like music, sports, cinema and smuggling. Perhaps Muslims are conspicuous in all these fields, but this would by itself be inadequate basis for inferring that the predominance of Muslims in these occupations is a direct consequence of their social blockage. Several participants pointed out that Wright's paper was based on scanty data and he had ignored the processes at work among the cross-section of the Muslims.

The European Conference on South Asian Studies has traditionally been dominated by political scientists and sociologists and social anthropologists and this was also true to some extent of the Paris conference. Even so, the panels on 'Labour History of Pre-Independent India' and 'Christian Missions and Indian Society' brought together several contributions by historians. In the panel on Labour History of Pre-Independent India the contributions of S Amin ('From the Field to the Factory: The Instruments of Cane Procurement; a Case Study of Eastern UP Sugar Mills in the 1930s') A M Hafner ('Madras Labour Union') and P E Perlin ('Ragi, Rice and Four Yard Dhotis: Indian Mill Workers as Historical Sources') were particularly noteworthy. Almost all the contributors to this panel were young scholars who are still in the process of completing their researches or thinking over their data; and their contributions and the discussions which took place at the panel session certainly provide promise of the new directions in Indian economic history.

Accommodating the large number of papers in the twelve panel sessions could not have been an easy task, especially when so many of them were of good quality, and several participants felt that the time available for discussions was too short. Nevertheless, this was more than made up by the possibility of informal discussions outside the panel sessions. The Conference was held in a big mansion which had formerly housed a factory for the manufacture of traditional Sevres pottery and is now the premises of the International Institute of Pedagogic Studies, and almost all the participants had been housed in the same building where the sessions were being held. This gave the participants opportunity to carry the discussion outside the conference hall and to pursue their queries, the special leads offered by the papers and their criticisms into the more informal and scenic setting outside. Certainly, the participants felt that the fact of their having been housed in the same building where they could discuss their common work and interests together was as rewarding, if not more, as participation in the panel sessions.

The European Conference on South Asian Studies has traditionally been a largely European affair, though South Asian scholars working in European universities have always attended it in good numbers. Continuing a practice at the Leiden conference two years ago, the organisers of the Paris Conference had this time again extended invitations to ten South Asian scholars from India, Sri Lanka, Bangladesh, Pakistan, and Nepal to participate in the conference. South Asian scholars are generally more familiar with the work of scholars in the US and UK, and with work being done at European universities which has become available in English; however, they are less familiar with work being done in European languages. Participation at the conference afforded the South Asian participants an opportunity to familiarise themselves with the excellent work being done at Leiden, Amsterdam, Copenhagen, Heidelberg, etc, and to discuss their own work with scholars from those universities.

Conferences of this magnitude are expensive to hold. The Paris Conference was funded by a generous grant from the Centre National de la Recherche Scientifique, the French counterpart of the Indian Council of Social Science Research. At the small business session held to decide upon the location of the next conference two years from now, several participants expressed concern at the difficulty of securing financial support and the possibility of the conference not being held until 1982 which Heidelberg University is to host. It was felt that the periodicity of two years was just about right and should be continued. Consequently, a small committee consisting of the organisers of the Paris Conference and a few other scholars was constituted to enlist organisers for a conference in 1980. Given the enthusiasm and the importance attached to it there is reason to believe that some institution or other would be found to host the conference in 1980.

Judging from the way the Paris conference went, there is no doubt that the organisers had put in painstaking efforts. Alice Thorner and Marc Gaborieau, both well known to South Asianists, added their personal affection and friendly style to make the conference an informal get-together and earned once again the affection of their co-workers in South Asian Studies. The Paris Conference was indeed a memorable academic experience.

The papers presented at the Paris Conference are shortly to be published by the Editions du Centre National de la Recherche Scientifique in Paris. Edited by Marc Gaborieu and Alice Thorner under the title, *Asie du Sud: Traditions et Changements*, 60 of the 72 papers included in the volume are in English.

PAKISTAN

Voice of the Loyal Opposition

ON December 3, 1978 the formation of Pakistan Awami Tehrik (PAT) was announced in Lahore in a press conference addressed by Rasul Bux Palejo. The formation of this new left alliance has been the culmination of various efforts to co-ordinate the activities of like-minded left groups and organisations. Earlier efforts had taken place through the establishment of the Awami Jamhoori Ittehad (AJI). This alliance did not adopt any clear stand on the nationalities question and refused to admit a number of organisations wishing to become new members. As a result three groups, Sindhi Awami Tehrik (SAT), Punjab Jamhoori Front (PJF) and Mehnat Kash Mahaz (MKM), resigned from the AJI and together with four other groups, Naujawan Mahaz (Karachi), MKP (Workers Group), Pakhtoon Khwa MKP and the Sindhi Labour Organising Committee, have announced the formation of Pakistan Awami Tehrik.

The Awami Jamhoori Ittehad has now been reduced to an alliance of eight groups and parties. These are MKP (Afzal Bangash), Workers Party (PWP), Socialist Party (PSP), Muttheda Mazdoor Majlis-e-Aml (MMMA), Awami Jamhoori Party (PAJP), Inqlabi Proletari Party, National Progressive Party (NPP) and Peoples Labour Front (PLF). Out of these PLF and NPP are likely to vacillate as regards their continued membership of the AJI.

The remaining groups which are not aligned with either the PAT or the AJI are the Qaumi Mahaz Azadi (Mairaj Mohd Khan), the Muttheida Mazdoor Federation (Usman Baloch) and the Major Ishaq faction of MKP. Mairaj Mohd Khan is likely to enter into negotiations with the PAT for admission as its eighth member. Both of these alliances, AJI and PAT, have been unable to obtain any participation from progressive elements in Baluchistan so far. (For earlier developments, see 'Prospects of Left Unity', *EPW*, December 23-30, 1978.)

Situation in Iran

The attitude of different political forces in Pakistan towards the situation in Iran provides an interesting commentary on the situation in Pakistan.

People's Party sources have emphasised the character of the movement in Iran as one directed against US imperialism while conveniently ignoring its opposition to both the superpowers including the Soviet Union. The Sanjabi-led National Front is presented as the biggest opposition party and receives considerable projection in PPP magazines. The Pro-Soviet Tudeh party, rather discredited within Iran itself, is described as the most efficient and most organised left party in Iran. The PPP naturally identifies itself with the National Front in Iran, but is rather embarrassed by its own inablity to launch a popular movement within Pakistan.

The Jamaat Islami and rightist press in general has slowly changed its attitude towards the progressive movement in Iran. Originally the reaction was one of lamenting the inability of the Iranian armed forces to restore law and order. In their view, the situation in Iran represented an international conspiracy against Muslims especially as Iran's military power and strength could not be tolerated by the big powers.

The change in the attitude of the rightist press appeared to coincide with the feeling that change in Iran is inevitable. Since then it is claimed that the "Islamic Marxists" are not leading the struggle and tentative support has been extended to the Shia leader, Ayatullah Khumeini. The religious aspects of the movement have been extolled — this in spite of Ayatullah Khumeini's statement that he is hot in favour of the kind of Islam being brought in Pakistan or Saudi Arabia. The tentative nature of support for Khumeini is evident from the warning that there are communist elements close to Khumeini.

The military regime headed by General Zia ul Huq undoubtedly views the situation in Iran with great concern especially as it will soon have to decide as to how to deal with the situation emerging from the completion of Bhutto's appeal in the Supreme Court. The decision of the Supreme Court will necessarily be a political one.

Interviews with Leaders

During the months of November and December a series of interviews with political leaders were broadcast on television. The interviewed politicians included Maulana Mufti Mahmud (JUI), Nawabzada Nasrullah Khan (PDP), Sherbaz Khan Mazari (NDP), Mian Tufail Muhammad (JI), Shah Ahmed Noorani (JUP) and Khan Ashraf Khan (KT). The remaining two major parties of the original Pakistan National Alliance have not so far participated in this series. Asghar Khan (TI) has refused to participate unless the interview is broadcast live and without editing; and the Muslim league, in view of its internal crisis and subsequent split into a Pagara group and a Chattha group, has also understandably not yet participated. Neither has the PPP participated in this series under the present conditions.

Thus, the parties that have participated in these interviews are all Islamic parties and these interviews highlight some of the internal contradictions within the Nizam-i-Mustafa movement and its relationship with the military regime.

Both Mufti Mahmud and Mian Tufail appeared as apologists for the military government. Mufti Mahmud appeared almost as a spokesman for the military regime explaining the weakness of the co-opted PNA government as due to the non-co-operation of the bureaucracy. He even agreed to nominations to local bodies as long as the provincial governments were first formed. Mian Tufail Muhammad made the claim that prices were being stabilised and that there was a downward trend in the prices of certain items.

Interesting differences emerged concerning the introduction of the Islamic system within the country. Shah Ahmed Noorani was of the view that the enforcement of the Nizam-i-Mustafa was not necessarily a gradual process but could be enforced within 24 hours. Mian Tufail Muhmmad claimed that the foundations for the Islamic system would be laid within the next few months while the entire system would be changed after elections. Nasrullah Khan considered that the introduction of the Nizam-i-Mustafa required mental preparation and could not be confined merely to changes in the penal laws.

Many of these leaders apparently believe that with the introduction of the Nizam-i-Islam all political and economic problems of Pakistan will be solved. Khan Ashraf Khan considered that the enforcement of an Islamic system would slove the provincial autonomy issue. Strict adherence to Islamic principles would lead to the resolution of the problems of the peo-

ple, according to Mufti Mahmud.

Each religious leader emphasised particular aspects of the Islamic system they desired. Mufti Mahmud outlined the Islamic economic system as being based on Zakat (a wealth tax), Ushr (a tax on agricultural incomes) and interest free banking. Nasrullah Khan emphasised freedom of expression in Islam and government responsibility for the economic support of the people. Mian Tufail outlined the Islamic economic system as one in which wealth flows from top to bottom (it is the other way round in the capitalist and socialist systems according to him). He rejected indirect taxation, but felt that the existing economic system based on interest could not, however, be uprooted in a short time. Shah Ahmad Noorani felt that the present taxation system was oppressive and unnatural for Muslims. He considered high expenditure on administration intolerable in an Islamic system and exphasised the need to introduce Zakat and Ushr.

The issue of separate electorates for the non-Muslim communities was generally advocated by the religious parties and opposed by Sherbaz Khan Mazari (NDP). For Mian Tufail Muhmmad, abandoning of separate electorates meant denying the very foundation of Pakistan. Nasrullah Khan considered separate electorates as a demand of the minority communities themselves.

Shah Ahmed Noorani accused the PNA politicians as being responsible for the postponement of elections in October last year and indicated that it was at their request that Zia-ul-Huq had postponed the elections. While Mufti Mahmud held that Pakistan should quit all defence pacts such as CENTO, Shah Ahmed Noorani was opposed to dissociation from CENTO. Sherbaz Khan Mazari criticised the views of Shah Ahmed Noorani that a strong centre alone can make the country strong and felt that the rights of smaller provinces and their autonomy needs to be reviewed.

In foreign policy all the religious parties emphasised relations with Muslim countries and all except for Nasrullah Khan ignored the broader alliance with all underdeveloped and Third World countries.

On the objectives of the PNA movement Mufti Mahmud emphasised the need to remove Bhutto and defeat the PPP while other leaders such as Noorani and Nasrullah laid greater emphasis on the restoration of democracy and the holding of fresh elections.

What none of these Islamic leaders touched upon were the real issues and problems facing Pakistan. In their view, what was most important and urgent was the ushering in of the Islamic system, when all problems will disappear and a state of bliss and plenty will be ensured.

Selection for Central Services

Baldev R Sharma

IN its meeting held at New Delhi on October 30, 1978, the Union Cabinet, decided to remove the language curbs hitherto in force for Central examinations. The new selection policy for Central services, according to the press reports, lays down that (a) the civil services will henceforth have a preliminary qualifying examination; (b) only those qualifying in the preliminary examination will appear at the main examination, and (c) candidates appearing in the main examination will be free to answer their question papers (except for the English and the language papers) in English or any other language listed in the Eighth Schedule.

As one who has been interested for long in the question of recruitment to higher occupations in business, industry and government, I welcome the proposed change in policy allowing candidates to answer question papers in a language of their choice. A change such as this was much needed and, in fact, long overdue. Intelligence, ability or skill is not the monopoly of those who are proficient in English or for that matter in any one particular language. And yet we have been selecting our professionals, managers and administrators almost entirely on the basis of their proficiency in English. Unfortunately, as a result of this policy, the middle and upper-middle classes of urban origin have continued to grab the lion's share of the most powerful positions in society. As years passed and as regional languages became the medium of instruction in more and more states, inequities further multiplied. To right this wrong or at least to reduce the growing disparities, the proposed change in the selection procedure for central services can indeed go a long way.

But the villains are two, not one. Besides English being the medium of testing, the so-called "objective" tests in use today are also responsible for the perpetuation of the elitist bias in higher occupations. This method of testing has been borrowed from USA where such tests are widely used in practically all walks of life. Although more work is required to arrive at definite conclusions, my researches so far have shown that in India the so-called "objective" tests seem to be biased in favour of the well-to-do candidates of urban origin and against the less-privileged candidates, particularly the rural poor. This is because the urban candidates from well-to-do homes are relatively more familiar with this "Western" method of evaluation as a result of which they tend to perform better in such tests. In most of the educational institutions in our country, on the other hand, evaluation through "objective" tests is unheard of. Thus, candidates from metropolitan centres and those from English-medium institutions have a definite edge over others because of their relatively greater exposure to the so-called "objective" tests. This is known as "test-wiseness".

The new policy of the government raises at least two questions. First, what will be the medium for the preliminary qualifying examination? If it is English, then the proposed policy change is likely to have merely an academic value. Second, what method of testing will be employed for the preliminary qualifying examination? If it is an "objective" test, then I am afraid things are unlikely to improve as a result of the revised policy. Let me explain the reasons for my pessimism. Even though the marks obtained in the preliminary qualifying examination will have no weightage nor will they serve any other function in the selection process, the twin factors — *objective* test and the *English* medium — will have done so much damage that the corrective effort proposed to be introduced in the *main* examination will be of little consequence. As I have tried to argue, these two factors are bound to provide an undue advantage to the top 20 per cent of our population and a serious handicap to the remaining 80 per cent. I say this not on the basis of speculation nor as a prophet of doom and gloom but as a research scientist. The findings of my earlier studies on the subject point to a direct connection between the language as well as the nature of the selection tests, on the one hand, and the emergence of socio-economic inequalities, on the other.*

As a result of the new policy, a larger number of candidates are likely to compete for the central services. If the initial screening is done on the basis of performance in "objective" tests using the English medium, candidates qualifying for the *main* examination (barring those coming through the reservation quota) will be overwhelmingly well-to-do persons of urban background. In fact, the elitist trend among the new recruits is likely to be even more pronounced than that already observed. The removal of language curbs during the *main* examination, therefore, will have little meaning as the reduced number of candidates reaching that stage are likely to opt for the English medium anyway. On the other hand, a vast majority of the candidates for whom the new policy is really intended are likely to have been eliminated from the race as a result of the initial screening! As I said before, the policy adopted by the Union Cabinet on October 30, 1978 is indeed good. However, before the Union Public Service Commission is asked to go ahead with the preliminary qualifying test, the government must guard against the potential harmful consequences of this innovation.

This is only an Announcement and not a Prospectus

Sehgal Papers Limited

(Incorporated on August 11, 1975 under the Companies Act, 1956)

Registered Office: 55 Nehru Place, New Delhi-110 019

Announcement regarding the Public Issue of 33,90,000 Equity Shares of Rs 10/- each cash at par

Persons interested in details may please obtain copies of the Prospectus and Application Forms from the Registered Office of the Company, Underwriters, Brokers to the Issue and any of the Branches of the Bankers to the Issue mentioned herein.

The Subscription list will open on the commencement of Banking hours on Monday, the 5th February, 1979 and will close at the close of Banking hours on Friday, the 16th February, 1979 or earlier at the discretion of the Board of Directors of the Company but not before the close of Banking hours on Wednesday, the 7th February, 1979. Applications have been made to Delhi, Bombay and Bangalore Stock Exchanges for permission to deal in and for official quotation for equity shares of the Company.

INCORPORATION AND MAIN OBJECTS OF THE COMPANY:

The Company was incorporated on August 11, 1975 as a Public Limited Company in the Union Territory of Delhi and the Certificate of Commencement of Business was obtained on March 9, 1976 from the Registrar of Companies, Delhi & Haryana.

The main objects of the Company, amongst others as mentioned in the Memorandum, inter-alia are manufacture of Writing & Printing Papers of all kinds including Soft & Absorbent Tissue Papers and its products and Carbonless Copy Papers. The Company has taken steps to accomplish the main objects as set out in the Memorandum of Association of the Company.

PROMOTORS:

The Company has been promoted by Mr M. M. Sehgal, a non-resident Indian and President of Reliance International Corporation Private Limited, New Delhi — a recognised Export House which also won the National Award of the Government of India for outstanding export performance. Mr M. M. Sehgal is also President of Overseas Markets Inc., New York, N. Y. and Far Eastern Markets, Inc, New York, N.Y. with long established offices in U.S.A., Hong Kong, Taiwan and Japan.

PROJECT AND ITS PRESENT STATUS:

It is the first project of its kind in Asia and the Middle East excluding Japan, manufacturing Soft & Absorbent Tissue Papers and its various products, Carbonless Copy Papers and a variety of fine Writing and Printing Papers. The project is situated in an area of about 174 acres at Sehgal Nagar, P.O. Dharuhera, Dist. Mohindergarh, Haryana, 52 kilometres from Delhi on the Delhi-Jaipur National Highway. Most of the machinery has been imported from U.S.A. and has already been erected. The Company is licensed to manufacture 9,000 tonnes of Printing and Writing papers, 10,000 tonnes of Paper and Paper Boards including Tissue Papers and 10,000 tonnes of Carbonless Copy Papers per annum. The Company is already manufacturing M. G. Tissues and Soft & Absorbent Tissue Papers and its various products, i.e. Tissue napkins, face and hanky tissues, toilet tissues, etc. which are marketed under the brand name "SNO-TEX". Carbonless Copy Papers will soon be made by the Company for the first time in India.

FOREIGN COLLABORATION/ASSISTANCE:

The Company has entered into technical agreement with Nashua Corporation of U.S.A., which, established 70 years ago, has successfully implemented similar projects for manufacture of Carbonless Copy Papers with some of the world's leading companies in U.S.A., France, Mexico, Brazil and United Kingdom. They will provide technical know-how and other necessary assistance for commissioning of Carbonless Copy Paper Plant. Stafford Machinery Corporation, a reputed firm of U.S A., have provided technical assistance for erection and start-up of Soft & Absorbent Tissue Paper Plant.

BUSINESS PROSPECTS:

Demand for all kinds of Printing and Writing Papers far exceeds the existing installed capacity in the country, and realistic assessment of future demand estimates made by various agencies suggests that the demand will increase year after year, thereby leaving a big gap between the demand and supply. The Writing and Printing Papers manufactured by the Company will, therefore, have no sales problem at all. As for Soft and Absorbent Tissue Papers and its products, the demand is approximately twice that of the production capacity of the Company Soft and Absorbent Tissue Papers were imported so far and therefore the Company's product will find a ready home market besides having huge export potential to Middle East and South East Asian countries, which also have been importing this paper so far.

Carbonless Copy Papers, which will be manufactured for the first time in India, will be used by Industries, Banks, Business Houses, Computers, Airlines, Hotels, Printers and many other requiring copies. M/s. Nashua Corporation have agreed to help the Company in exporting its products from the start of production for which a vast potential exists in Asia and Middle East countries. The Company will earn valuable foreign exchange by exporting its products. The Directors are of the opinion that barring any unforeseen circumstances, the Company will be able to earn sufficient profits to pay dividends to the shareholders within a reasonable time.

IMPORTANT TAX BENEFITS:

Being in a backward area, the benefits to which the Company is entitled are — Deduction @ 20% of the Company's income for a period of 10 assessment years, Central Cash subsidy of Rs. 15 lacs, exemption from electricity duty for 3 years and interest free loan from State Government against payable inter-state Sales Tax for a period of three years. Besides, our project is entitled to deduction from income @ 7.5% per annum on the total capital employed for 5 years, 25% investment allowance on the installed cost of the Plant and Machinery, and amortization of preliminary expenses over a period of 10 years. In addition, investment by shareholders in equity shares of the Company will be totally exempt from Wealth Tax for a period of 5 years, and even after 5 years shareholders will continue to enjoy Wealth Tax exemption benefits, provided the value of investment in equity shares of the Company together with the value of their other assets does not exceed Rs. 1.50 lacs. The shareholders will be eligible to deduction in the computation of taxable income, 50% of the amount invested in equity shares of the Company, the maximum income in a year qualifying for such deduction being Rs. 10,000/-. Shareholders will be exempt from Capital Gains Tax if sale proceeds arising from the transfer of an asset are re-invested within 6 months in shares of the Company.

PROJECT COST:

The total estimated cost of the project is Rs. 17.40 crores and will be financed by Term Loan (Rs. 11.60 crores) Share Capital (Rs. 5.65 crores) and Central Cash Subsidy (Rs. 15 lacs).

SHARE CAPITAL

A. **Authorised**
75,00,000 Equity Shares of Rs. 10/- each — Rs. 7,50,00,000

B. **Issued, Subscribed & Paid-up**

			Face Value (Rs.)	Paid-up (Rs.)
i)	1,704	Equity Shares of Rs. 10/- each allotted to the subscribers to the Memorandum and Articles of Association of the Company which have been fully paid-up for cash at par.	17,040	17,040
ii)	9,41,858	Equity Shares of Rs. 10/- each fully paid-up allotted for cash at par to the Promoters, Directors, their friends, associates, associate companies and others.	94,18,580	94,18,580
iii)	27,300	Equity Shares of Rs. 10/- each subscribed by and allotted for cash at par to the Promoters, Directors, their friends, associates, associate companies and others Rs. 7.50 paid-up per share.	2,73,000	2,04,750
iv)	12,89,138	Equity Shares of Rs. 10/- each subscribed by and allotted for cash at par to the Promoters, Directors, their friends, associates, associate companies and others Rs. 5/- paid-up per share.	1,28,91,380	64,45,690
			2,26,00,000	1,60,86,060

C. **Now offered to the public for subscription for cash at par**
33,90,000 Equity Shares of Rs. 10/- each Rs. 3,39,00,000

Terms of Payment:

Application for shares must be for a minimum number of 50 Equity Shares or multiples thereof and the amount payable shall be as under:
1. On Application : Rs. 2.50 per share
2. On Allotment : Rs. 2.50 per share
3. Balance Rs. 5/- per Equity Share shall be payable in two calls of Rs. 2.50 each.

There shall be an interval of one month in between allotment and the first call and also between the two calls. At least 30 days notice shall be given by the Company for each such call.

BOARD OF DIRECTORS

Mr M. M. Sehgal: Chairman & Managing Director
Mr J. B. Dadachanji, Mr P. L. Dabral: IDBI Nominee
Mr Carlos E. Stafford, Mr A. N. Mathur: HSIDC Nominee
Mrs Anjali Sehgal, Mr L. C. Arora: IFCI Nominee

APPLICATION FORMS AND PROSPECTUS:

Application forms and copies of the Prospectus may be obtained from the Company's Registered Office, the Underwriters, Brokers and Bankers to the Issue named above or from any of the offices of the Bankers to the Issue named in the Application Form.

ISSUE MANAGED BY

Champak Lal Investment & Financial Consultancy Ltd., Regent Chambers, 208, Ceremonial Boulevard, Nariman Point, Bombay-400 021.

Issue opens on 5th February 1979.

Issue closes on 16th February 1979 or earlier but not before 7th February 1979.

Political Imprisonment and Torture in India

Amnesty International Report

AMNESTY INTERNATIONAL (AI) was on a mission to India between December 31, 1977 and January 18, 1978, and submitted a Report on its mission to the Government of India on September 21, 1978. The Report, and the Government of India's official response to the Report in the shape of a 'Note on Some of the Main Points raised in the Memorandum forming part of the Report of the Amnesty Internal Mission to India' dated November 17, 1978, was released by AI on January 10. A slightly edited version of the summary of AI's findings, and Appendix B of the Report consisting of the interviews AI carried out with some of the prisoners (in one case, a dead prisoner's relations) in Kerala and West Bengal who personally experienced police torture and, in two cases, survived police shootings, is presented below.

Summary of Report

RESTORATION OF RULE OF LAW AND PROTECTION OF FUNDAMENTAL RIGHTS

On March 21, 1977 Indira Gandhi's Government revoked Emergency which it had declared for internal reasons on June 25, 1975. This action implied that fundamental rights were restored, that the right of *habeas corpus* could be enforced. It also implied that the most objectionable provisions of Emergency legislation affecting political imprisonment — the drastic amendments made to the Maintenance of Internal Security Act during the Emergency, providing the government with unlimited powers to detain persons indefinitely without access to the courts — automatically ceased to obtain.

On March 24, 1977, the new government took office and immediately took rigorous steps for the release of the thousands of political prisoners still held in detention. It restored the independence of the judiciary and the Lok Sabha repealed the Publication of Objectionable Material Act, 1976. In September 1977, the Defence of India Rules (DIR) lapsed automatically. Under the provisions of the DIR, and of the Maintenance of Internal Security Act (MISA), thousands of political prisoners and, indeed, very many prisoners of conscience, had been held during the Emergency.

On May 15, 1978, the Law Minister introduced the Constitution 45th (Amendment) Bill in the Lok Sabha, which provides guarantees that the legal enforcement of the right to life and personal liberty cannot be suspended during an Emergency. But other fundamental rights can still be suspended in such a situation.

DETENTION IN INDIAN LAW

Preventive detention is the holding of a person without trial when the evidence available is not sufficient for him or her to be charged or for a conviction to be secured by legal proof. Preventive detention was introduced in India under the British colonial administration and has since frequently been used both by the Central and state governments. Preventive detention laws, initially enacted for a stated limited purpose, have often been given wider application and have been used instead to detain peaceful opponents of the government in power. Since 1970, the main instrument for preventive detention has been the Maintenance of Internal Security Act (MISA), enacted by the Central government. This Act was used indiscriminately during the recent Emergency to detain thousands of prisoners of conscience for indefinite periods without trial. In India, preventive detention is permitted by Article 22(3)-(7) of the Constitution, and there is no present intention on the part of the government to abolish it.

On December 23, 1977, Janata party government introduced the Code of Criminal Procedure (Amendment) Bill, which was to have retained preventive detention. But in the face of vocal opposition from civil liberties organisations and the press, the government announced on March 23, 1978 that it would withdraw the Bill and the Lok Sabha passed another Bill unconditionally repealing the 1971 Maintenance of Internal Security Act.

Although the Central Government Bill has not been enacted in view of considerable pressure from public opinion against it, five states — Andhra Pradesh, Rajasthan, Uttar Pradesh, Madhya Pradesh and Jammu and Kashmir — retain preventive detention laws. The Central government has no intention of advising them to repeal these laws. The widest powers for preventive detention at present exist in Jammu and Kashmir.

CURRENT POSITION OF POLITICAL PRISONERS

After the ending of Emergency, nearly all prisoners of conscience were immediately released. The Amnesty International report expresses concern about the continued imprisonment of the following two groups:

(a) *Political prisoners held under MISA:*

On July 1, 1978 the Minister of State for Home Affairs stated that a total of 86 persons were still in detention under MISA, the majority of them 'foreigners' but also 13 Indians held in connection with security reasons. In view of the observations made in the report about the practice of holding political prisoners in long-term preventive detention without trial or charges, for reasons of security of the State, and considering that government has never claimed that there is any evidence of a criminal nature against these prisoners, Amnesty International regards all these prisoners as prisoners of conscience.

(b) *Other political prisoners:*

Political prisoners of various political persuasions have been arrested on *suspicion of alleged extreme left-wing* activities and are commonly referred to as 'Naxalites' (officially, the Communist Party of India, Marxist-Leninist). These political prisoners have been arrested from 1969 onwards, the majority of them in the early 1970s. In September 1974, Amnesty International published a report, *Short Report on Detention Conditions in West Bengal Jails,* describing the inhuman conditions in which these prisoners were being held, and pointing out that many prisoners allegedly belonging to the Communist Party of India (Marxist-Leninist) and also to the Communist Party of India (Marxist) had been arrested for security reasons under preventive detention laws and had subsequently been charged with a number of criminal offences punish-

able under the Penal Code or the Arms Act, such as participation in unlawful assemblies, conspiracy, attempted murder, murder, robbery or illegal possession of arms. However, in most cases the prisoners were not brought to trial.

Amnesty International estimates that, in the three Indian states it was able to visit, at least 500 political prisoners in this category were being held, apart from several hundred more in other Indian states (such as Bihar, Tamil Nadu, Punjab and Orissa). These figures were confirmed by official statistics in March 1978, when the government stated that the total number of 'Naxalites' in prison was 894, including 247 in Andhra Pradesh, 286 in Bihar and 199 in West Bengal. (The latest government figure is that there were 373 'Naxalites' in prison as of August 1, 1978).

The Home Minister explained to the Amnesty International delegation that, although the Central government had recommended that all such prisoners held for more than five years should be released under certain conditions, the release of these political prisoners was a matter for the states to decide upon, since the maintenance of law and order was a state responsibility. It is indeed true that in the federal system of government in India, the division of powers between the Central government and the states has allowed state governments sensitive to political activities such as those of the Naxalites to adopt differing policies for the release of this type of political prisoner; as a result of which in some states there are still some political prisoners held for more than five years without having been tried, whereas in other states, such as West Bengal, the vast majority have now been released.

Torture of Political Prisoners and Deaths in Police Custody

Torture :

There has been evidence in Indian courts to suggest that police brutality towards suspects during interrogation has for a long time been a common occurrence in India. Specific allegations of torture of political suspects began to reach Amnesty International in the 1960s, and the most detailed allegations to have reached Amnesty International are from those areas where the 'Naxalite' movement has been active.

Amnesty International, in its 1974 *Short Report on Detention Conditions in West Bengal Jails*, detailed several cases of torture of alleged Naxalite prisoners and expressed serious concern about the occurrence of torture in various Indian states, a concern which increased after the 1975 Emergency declaration when allegations of the torture of political prisoners reached the organisation from nearly all over India.

During their visit to India, the Amnesty International delegates interviewed seven victims of torture, two of whom are now disabled as a result of the treatment they received after arrest. The allegations of torture include the beating of prisoners with lathis and guns, beatings on the soles of the feet, extinguishing cigarettes on sensitive parts of the body, rape, threatened execution, and the prolonged hanging of suspects upside down, suspended from the knees. Many of those to whom the delegates spoke told Amnesty International that legal formalities, such as the right to appear before a magistrate within 24 hours of arrest, were often not observed. In Kerala, the police are alleged to have forged the daily records of arrest in the case of a political prisoner who is believed to have died in custody.

The interviews confirm that a pattern of police brutality towards suspects during interrogation already existed long before the declaration of Emergency. In the case of political prisoners suspected of holding extreme political views, this has resulted frequently, and particularly during Emergency, in ill-treatment, torture and, in some cases, even in death as a result of police torture.

Deaths in police custody :

The case of engineering student P Rajan has become a symbol in India of the type of police excesses which occurred during the Emergency. Rajan died on March 2, 1976 as a result of now officially admitted continuous torture inflicted on him by the police. So far as Amnesty International is aware, this is the only case where a criminal prosecution has been instituted against individual police officials for participating in acts of torture leading to the death of a political prisoner.

In the state of Kerala, the Amnesty International delegation was told of similar cases to that of Rajan. Amnesty International has interviewed the relatives and friends of one of them, Vijayan Nair of Varkala and, on the basis of its interview, has no reason to doubt that Vijayan Nair died in Sasthamangalam Crime Branch Police Camp on March 8 or 9, 1976 as a result of continuous police torture. Similarly, during its visit to West Bengal, Amnesty International received allegations that political prisoners had died in the custody of the police of Lal Bazar Police Station prior to Emergency declaration, and similar cases are also believed to have occurred in other Indian states which Amnesty International has not been able to visit.

Recent experience has confirmed that existing legal safeguards in Indian law have not proved sufficient to protect a substantial number of Indian citizens from being subjected to severe ill-treatment and torture.

Killings of Political Prisoners in 'Encounters' and 'While Trying to Escape'

There have been serious allegations over the past ten years that political prisoners have been killed by police forces 'while trying to escape from prison' or in 'encounters with the police'. Amnesty International considers torture and the killing of political prisoners by police forces to be most serious violations of human rights.

Allegations of this nature have been of longstanding concern to Amnesty International. The *Short Report on Detention Conditions in West Bengal Jails* listed 12 jail incidents in which 88 political prisoners died between 1970 and 1972 in the states of West Bengal and Bihar, and cast serious doubts on the official explanation that these prisoners were shot 'while trying to escape from prison'. In Andhra Pradesh, the allegations are that between 300 and 500 Indians were killed by police forces during the years 1968 to 1977, following arrest, in staged 'encounters'. According to official statistics, 214 persons are stated to have died in encounters with the police in the period from 1968 to 1977, but local civil liberties organisations (some of whom are members of left-wing political parties) maintain that nearly all of these were in fact deliberately killed by the police. So far, no police officials alleged to have been involved in the 'encounter' killings have been suspended.

Since 1968, certain parts of Andhra Pradesh have been declared 'disturbed areas' and it has been alleged that

the majority of the encounter incidents took place in these. In 'disturbed areas' the police are empowered "if it is necessary to do so for restoring or maintaining law and order" to fire upon groups of more than five people — even without warning — if in their opinion their assembly is unlawful, or upon persons found carrying weapons or things capable of being used as weapons. Such actions by the police cannot be challenged in any court, except with the sanction of the state government concerned.

Prison Conditions

During its visit, the Amnesty International delegation was given the opportunity to visit prisons in New Delhi, Calcutta and Hyderabad.

In Delhi's Tihar Jail, the Amnesty International delegates saw one prisoner in bar fetters. He has been held continuously in this condition for approximately 18 months. Bar fetters consist of an iron ring round the ankle, each of which is attached to an iron bar some 20 inches long, the bar being connected to another iron ring round the waist. The fetters prevent the prisoner from running, bending or climbing, and they have in the past often been used on alleged Naxalite prisoners. Amnesty International was told by prison officials that they were used only on individuals inclined to physical violence, or who had actually attempted to escape from prison. However, according to officials in Calcutta's Presidency Jail, the iron fetters could also be used for 15 days as a punishment, after which the Inspector General of Prisons had to authorise their further use. There is no limit in the prison rules on the length of time that they can be applied, and some prisoners were reported in the past to have been subjected to imprisonment in bar fetters for several years. Despite the official assurances received by Amnesty International, the use of iron fetters appears to be punitive rather than preventive.

In past years, prisoners held for 'security reasons' have been denied normal prison facilities and even medical treatment. Amnesty International notes that a provision to withhold ordinary 'medical, recreational and other facilities' from 'detenus' (political prisoners held in detention without trial) was also included in the new preventive detention law which government introduced after Emergency. Amnesty International believes that all political prisoners, including those held in detention without trial, should have access to all the facilities normally available to other prisoners. This is in line with the provisions of the Standard Minimum Rules for the Treatment of Prisoners: Rule 95. Furthermore, political prisoners who have not been tried should always be granted the rights guaranteed in the United Nations Standard Minimum Rules, such as the right to books and writing materials, to be visited by their own doctors and to inform their families of their detention. They should also have reasonable facilities for communication, be able to receive visits from a lawyer and be able to apply for legal aid.

Case Histories

Kerala

M P Appanu, of Kandakkai, Cannanore:

High school teacher. Arrested on December 19, 1976 from his home by police, who beat him in front of his 80-year old mother, in order to extract information. Taken to Crime Branch Office, Cannanore, where he was beaten with fists and lathis for one hour from 4.30 a m. At 10 a m, beatings continued, supervised by Sub-Inspector A, until the prisoner's head started bleeding. Appanu said he had twice been given the 'roller treatment': the prisoner was stripped naked and tied at both his knees and ankles, his hands tied behind his back; he was laid on a bench and rollers of wood were placed across his thighs; one policeman stepped on the roller, leaning on two policemen on either side, and then walked backwards and forwards on the roller over the prisoner's thighs. At the same time, the prisoner was being beaten on the soles of his feet. Appanu's students, arrested with him, were forced to beat their teacher. After 50 days' detention, he was given a detention order under the MISA. He was never brought to trial.

Dileep Kumar:

Arrested on April 15, 1971 by the Crime Branch, he was held for four months in detention, until after a *habeas corpus* petition had been presented on his behalf by two friends (the police had first denied his arrest). After four months, he was produced in court and charged with murder, after which he was transferred to prison. Prior to that he had been held by the police. On arrest, he was kicked with boots and beaten on the soles of his feet. He said he suffered continuous beatings on his chest with sticks and had been hung from the ceiling with his hands tied behind his back and, in this position, was beaten with guns. He was held for four years in prison as a prisoner under trial and, when brought to trial, was acquitted. He was released by a court order in January 1975. Kumar complained that, throughout the period of his imprisonment, his family, who came to meet him in prison, were sent back from the jail gate. He had not seen any member of his family throughout his imprisonment.

V S Narayan, Trivandrum:

Arrested in August 1970 fom Kotall. Following his arest, he was held for six months in Potakolli Camp. From December 26-29, 1970, Narayan says, he was tortured there by the police. His hands and feet were chained together and he was severely beaten with guns, while lying on the floor. As a result of this treatment, ribs in his back had been broken. X-rays made after his release show that his spinal cord was partially dislocated. While he was given some medical treatment in the jail hospital, he was never allowed outside hospital treatment. Only after his release in July 1977 did he receive specialist treatment, in Medical College. His back is still painful and, at the time of the interview, he was wearing a corset and had considerable difficulty in walking. Following his arrest in 1970, he was charged with murder and decoity. The case started in 1972 and ended in 1974 with his acquittal. He was then involved in another criminal case, which ended similarly in his acquittal in the same year. The last case finished in 1977, he was acquitted and was finally released in July 1977. As of the date of the interview, January 1978, he was under doctor's orders to keep complete rest.

West Bengal

Shambunath Shaha, Calcutta:

Arrested at 11 a m on November 16, 1970 by Calcutta Police. Shaha showed the marks of five bullet wounds in his back, three of which had penetrated to his chest, which he had received on the night of November 18, 1970 from police from the Lal Bazar Police Station. Following his arrest, he was taken to the local police station and beaten on the soles of his feet until they bled. He was then hung from an iron pole by his knees,

with his hands and feet tied together at his ankles, and beaten in this position. At 1 a m on the following morning he was taken to Lal Bazar Police Station, Calcutta, where he was asked the names and hiding places of Naxalites.

Following interrogation, he was taken by police officers to Salt Lake, outside Calcutta, where, handcuffed, he was taken out of the police car and hit by three shots fired at close range after being ordered to walk away from the car. When the police noticed he was still alive, he was taken in the back of the car to a site at the bank of the Ganges River, where another three shots were fired at him, two of which hit him. Remaining unconscious, Shaha was taken to a third place, near his home, and shot at once more. He was then taken by the police to Marwari Relief Society Hospital, where the following morning the police came to collect his body and the death certificate. However, Shaha had been operated on, the bullets had been removed and he was still alive. The police alleged that he had received the wounds in an encounter with the police on the morning of November 17, 1970, one day after his arrest. He remained in hospital until December 2, 1970, when he was again taken to Lal Bazar Police Station. He was finally brought to Presidency Jail, Calcutta.

The prisoner was charged with murder and, on March 15, 1973, acquitted of the charge by the sessions judge. He was rearrested under the preventive detention provisions of the Maintenance of Internal Security Act on February 2, 1974 and released on June 21, 1977 from Presidency Jail, when the new West Bengal Government assumed office.

Miss B (the name of Miss B is known to Amnesty International but is deleted at the request of this witness):

B was 16 years old at the time of her arrest. She was arrested in the afternoon of September 7, 1972 in Jadavpur, Calcutta, by the Eastern Super One Division of Calcutta Police and asked for information about 'Naxalite friends'. She was taken to Lal Bazar Police Station, Calcutta. The next morning she was brought before a magistrate but subsequently held in police custody for six days, after which was brought to Presidency Jail on September 12, 1972, where she stayed until December 11, 1973. She was then taken from Presidency Jail for interrogation for several days at Lal Bazar Police Station. She says that during these interrogations at Lal Bazar Police Station, by the 'Anti-Naxalite Squad' she was forced to lie face-down on a table, and was severely beaten with lathis, particularly on the hips and thighs. She resisted police officers who wanted to extinguish burning cigarettes on her body. Amnesty International was told by friends of B that, during the interrogations, she was raped twice, once on her arrest, in the DSG Office of the police, and once in Lal Bazar Police Station. She specifically mentioned the names of police officials involved in this treatment. She was taken back to Presidency Jail, Calcutta on January 4, 1974. She was finally released on February 4, 1976, without having been tried.

Barid Kanti Sarkar, alias Kanu, of Taltola, Calcutta:

Sarkar, a student at the time, was arrested between 4 and 5 a m on November 16, 1970 with three friends, and taken directly to Lal Bazar Police Station, Calcutta. The family were never told of his arrest and, on their making inquiries at the local police station, the police denied that Sarkar had been arrested. Sarkar says that from 8 p m that evening, he and his friends were beaten with lathis during interrogation and that he was threatened with death by Inspector N if he would not disclose information. He says that around midnight he was taken in a black jeep to a crossing of S N Banerjee Road and Durga Charan Doctor Road, Calcutta, where the policemen left the truck and planted bombs in Durga Charan Road, which exploded shortly afterwords. At 3 a m, the jeep drove to a quiet place along the Ganges, near Kashipur Rifles Factory, and he was told he would be killed if he did not disclose information. When he replied in the negative, Sarkar was then shot at at close range in the chest by Inspector N, and fell down in the jeep. He was taken to Calcutta Medical Hospital Emergency Department, where the police reported that he had been picked up at Durga Charan Doctor Road and that the police had shot at him in self-defence. Later, he was charged in a case under the criminal code, the charge sheet being dated November 17, 1970, and finally he was acquitted in the Sessions Trial No 1 of 1974 by the Court of City Sessions, Calcutta. He was subsequently charged in several other cases, but finally released on July 3, 1975.

Sarkar's body still shows the marks of the bullet wounds both in his back and chest. During the night he was shot, he says he also witnessed the killing, on the bank of the Ganga under similar circumstances, of Asoke Dutta, a friend of his arrested with him. Sarkar claims that, Asoke Dutta was shot at by the police and thrown into the Ganga, but the police deny his arrest and the shooting. The Democratic Lawyers Association in Calcutta have filed a complaint on behalf of Barid Kanti Sarkar in the metropolitan magistrates court, requesting that action be instigated under provisions of the Penal Code for murder against various officers of the Detective Department (Special Cell), Calcutta Police.

Sarkar has brought complaints against eight police officers before the Metropolitan Magistrate, Calcutta, that criminal proceedings be instituted against these police officers under Sections 302 (murder), 307 (attempted murder) and 201 ("causing disappearance of evidence of offence, or giving false evidence of offence, or giving false information to screen offenders") of the Indian Penal Code.

Archana Guha:

Archana Guha, 35 years old, is totally paralysed from the waist down, as a result of the treatment she received during police interrogation. At the time of her arrest, she was headmistress of Kolorah Girls' Junior High School, in Howrah, Calcutta. So far as Amnesty International is aware, Archana Guha had no involvement in politics, but was presumably arrested because the police suspected some of her relations to be involved in the Naxalite movement. Archana Guha's case is one of only two known to Amnesty International in the state of West Bengal where an individual action has been brought in court under provisions of the Indian Penal Code against police officers, requesting their prosecution for "voluntarily causing grievous hurt" (Articles 325/331 of the Penal Code), "wrongful confinement to extort confession" (Aticle 346 of the Penal Code) and "insult to the modesty of a woman" (Article 509 of the Penal Code).

Archana Guha was arrested about 1.30 a m on July 18, 1974, together with her sister-in-law, Latika Guha, and Gouri Chatterjee, a friend. They

were arrested by police officers who had searched the house and they were never shown a warrant of arrest. They were first taken to Cossipore Police Station and then transferred to Lal Bazar Police Station, Calcutta, where they were taken to the special cell of the detective department, on the first floor. "The special cell" consisted of three rooms arranged like an 'L', the middle room being the office of N, and the back room being the one where, according to Archana Guha, "tortures are being carried out". On July 18, at 10 am, Gouri Chatterjee was taken for interrogation and Archana Guha was forced to witness the treatment given to Gouri Chatterjee. Afterwards, Archana Guha was brought in and given similar treatment: her hands and feet were tied to a pole placed behind her knees. The pole was rested on two chairs and the prisoner hung with her head down. She was hit on the soles of her feet by Inspector S. Inspector N extinguished burning cigarettes on the soles of her feet and on her elbows, of which marks were still visible at the time of the interview. She was kicked with boots and the nails of her toes and fingers were burned. She fell unconscious. At 2 pm the three women were taken back to Lal Bazar lock-up and at 4 pm brought back for interrogation. She was again hung from a pole as before and drops of water were slowly dripped onto her forehead; she was burned on her feet and elbows and also again beaten on her feet and kicked. The next day, on July 19, 1974, the three women were taken to the Sealdah magistrates' court, but never brought before a magistrate. They were charged under various sections of the West Bengal Maintenance of Order Act and the Defence of India Rules. That same afternoon the three women were brought to the special cell for further interrogation, where Archana Guha was beaten on the head ("physical brainwashing") and forced to sign a printed paper, the contents of which she could not read but which she believed would implicate her in political actions. The same day Police Officer A B beat her on the head and threatened her with execution if she would not "confess". Inspector K K during interrogation pulled her by the hair and several times threw her against the wall. Her hair was pulled out from her forehead and she was pulled up from the floor by her hair and, while she was hanging in this position, she was kicked and burned. The same methods were applied the following day, July 20, when Archana Guha was also threatened with rape and hit on the head with a rope. She was unable to walk to her cell. From July 22 to August 1, 1974, almost every day the women were brought to the Special Cell. All three women prisoners remained in the police lock-up from June 18 to August 13, 1974 and never saw a lawyer.

On August 13, 1974, Archana Guha was taken to Presidency Jail, Calcutta, as an "under trial" prisoner and, on September 30, served with an order of detention under the MISA. Her physical condition deteriorated rapidly, she often fell unconscious, but was not given adequate medical treatment and her legs became disabled. On the insistence of other women prisoners, specialist doctors were finally called in and it was not until December 22, 1975 that Archana Guha, by then completely paralysed from the waist down, was taken to hospital for a minor operation on a gland. On January 24, 1976 she was returned to prison on a stretcher and only on February 9 did the jail authorities arrange for her transfer to Medical College, Calcutta, as a "life-saving case". She stayed in the hospital until November 17, 1976, when she was released on parole. The detention order against her was not revoked until May 3, 1977.

Amnesty International has had the medical reports prepared by Archana Guha's doctors examined by the Chief Neurologist of the Rigshospitalet in Copenhagen, who concluded that "It seems, however, beyond doubt that the 1974 torture caused a lesion of the lower part of the spinal cord, either because of a direct traumatic damage or secondary by development of a traumatic arachoniditis."

Interview with relatives of Vijayan Nair (known as Vijan), from Varkala, Kerala, who Amnesty International believed to have died in the custody of the police:

Vijan was arrested on March 5, 1976 and is thought to have died as a result of torture in Sasthamangalam Crime Branch Police Camp on March 9, 1976. He owned a bookshop selling left-wing literature, near his village, Varkala.

Two months before his arrest, on January 26, 1976, a warrant was issued for Vijan's arrest, and his bookshop was closed by the Crime Branch. Vijan was arrested at the Transport Bus Stand No 10, East Fort, Trivandrum. After his arrest he was taken to Sasthamangalam Crime Branch Police Camp by Inspector S D. Vijan's father gave Amnesty International the names of witnesses who had seen Vijan in police custody being tortured. According to these witnesses, who have made sworn statements before Varkala Magistrates' Court, Vijan was subjected to the 'roller treatment' and he was seen to be beaten severely on sensitive parts of the body. One witness has also testified before the local magistrate that he saw Vijan in an unconscious state in police custody and was threatened by the police, when released on March 12, 1976, not to disclose anything he had seen. Another witness has testified he saw Vijan vomitting blood and trying to stand but collapsing. These witnesses have named six police officers allegedly involved in torture but, so far as Amnesty International is aware, no action against these police officers has so far been taken. The statements of the witnesses of Vijan's treatment were made before magistrates at Varkala and Attingal and Pathanamthitta, in Trivandrum. Vijan was last seen on the evening of March 9, when his condition had weakened to the extent that he could not eat or drink. The magistrate inquiring into the incident had ordered the production of a diary of the date on which Vijan was thought to be arrested; lawyers have been able to prove that the entry was falsely replaced in the police record.

Financing Patterns

L C Gupta

Report on a Study of the Debt-Equity Ratio Norms by B K Madan; The Management Development Institute, New Delhi, 1978; pp x + 134, Rs 40.

THIS study may be said to fall into two distinct parts: the first part (chaps 2-4) surveys the trends, present institutional practices and the government regulations concerning debt-equity ratios while the second (chap 5) examines various suggestions and makes recommendations on debt-equity norms to be observed. By and large, the author finds nothing seriously wrong with the current practices. No radical, or even mildly radical, changes are, therefore, suggested.

Chapter 2 gives a useful bird's-eye view of the rules, guidelines and definitions prescribed by the Controller of Capital Issues with regard to debt ratios.

In the next chapter the author sets out to present the experience of Central- and state- level financial institutions regarding debt-equity ratios but ends up, unaware, with something quite different. The data presented in the chapter does not describe debt-equity ratios in the sense normally understood. They pertain to the financing pattern of project costs instead. A debt-equity ratio is meaningful for enterprises, not for projects. The proportion of debt used in the financing of a particular project may be quite different from the debt-equity ratio of the company undertaking the project. Only for entirely new companies can debt-equity ratios be compiled from the data on project financing. Debt-equity ratios are interpreted in terms of the ability of borrowers to service the debt whereas the financing patterns of projects have a different significance. Debt-equity ratios should always be computed for an enterprise taken as a whole, and not separately for each project that an enterprise may undertake from time to time.

The debt-equity ratios of companies are much lower than the impression created by the data on project costs presented in the study. This would be clear if one compares the data, given by the author, for ICICI-assisted companies with the data for IDBI- and IFCI- assisted companies. The former data have been drawn from "Financial Performance of Companies: ICICI Portfolio" (1974-75) published by the ICICI and relate to debt-equity ratios for companies, not projects. On the other hand, data for IDBI and IFCI were drawn from their annual reports and they show how project costs were proposed to be financed, not debt-equity ratios of companies undertaking the projects. The average debt-equity ratio for the ICICI-assisted companies was 0.38:1. The ratios for IDBI- and IFCI- assisted projects substantially exceeded 1:1 for an overwhelming majority of the cases, as per the author's data. Since the author has not drawn the reader's attention to the difference in the conceptual basis of the two sets of data or offered any comment on the sharp difference found, the reader may be misled into believing that ICICI permits lower debt-equity ratios than the other two all-India institutions. The comparability of data is also affected by the fact that while data about ICICI are based on actuals from company accounts, data about IDBI and IFCI are based on proposed financing schemes which may not necessarily materialise.

For the reasons given above, the data presented in chapter 3 about IDBI- and IFCI- assisted projects are not comparable also with data in chapter 4 about trends in debt-equity ratio. The latter chapter is based mainly on company finance studies carried out by the Reserve Bank from balance sheets of companies.

There is an interpretational difficulty about the data presented in chapter 3 for another reason. The IDBI- and IFCI- assisted projects are distinguished between "new" and "existing" units but it is not clear whether the term "units" refers to firms or plants, a very important economic distinction. The "firm" is the ownership or controlling entity while the "plant" is the establishment or factory. An existing firm may establish a new factory in a different location, say, in a backward area. It is not known how the various institutions would classify this project, whether as a new undertaking or as an existing undertaking. Perhaps in their anxiety to create a favourable impression, the financing institutions tend to classify new factories established by existing firms under the category of new units. Since the important thing to know is how far the financing institutions are assisting new firms, such new factories should not be classified as new units. The classification must relate to firms, not factories.

Chapter 5 brings out fairly clearly that the relaxation of debt-equity norms has gone fairly far, through concessions already granted in the case of projects located in backward areas, huge-sized projects, small entrepreneurs and technician entrepreneurs and also through institutional devices such as IFCI's Risk Capital Foundation, IDBI's Seed Capital Scheme, and Sales Tax Loan Schemes of several state governments. Madan generally takes the view that the present practices accommodate most of the needs. The "democratising" argument (see p 96) about relaxations in favour of medium-sized enterprises seems not very relevant. It would have been more illuminating if the study had been supported by an examination of the effects of different levels of debt on the financial performance of enterprises of various sizes. Such data would have provided a firm basis for formulating policies rather than going by hunches.

There are certain fundamental issues which ar not covered in the study but quite relevant from the viewpoint of governmental policies about debt-equity norms. Debt-equity ratios have been distorted considerably by the system of corporate taxation; the higher the tax incidence the greater the distortion. Because of this, the cost of capital for share financing is approximately 2½ times the cost of capital for loan financing. The old concept of making, for tax purposes, a sharp distinction between the creditor who lends money for interest and shareholder who invests for dividend is no more relevant for the modern corporation. The shareholder in a modern corporation is only a particular kind of lender, a lender who accepts a variable return on his money. His control over the affairs of the corporation is only nominal. As Galbraith once remarked, the shareholder has a vote but his vote is valueless. In any case, the preference shareholders have no voting power under normal circumstances. In fact, the lending institutions today exercise far more control over borrowing enterprises than the shareholders in general. The whole logic of allowing interest as a deductible expense for tax purposes but not allowing dividends needs to be re-examined. Why should a borrowing enterprise be

subsidised in this indirect manner while an enterprise relying largely or wholly on equity is not? The distortions can be corrected by changing the basis of corporate taxation, as has been repeatedly debated in economic literature in recent years. There is a good case for radical reforms in this area from the viewpoint of promoting greater efficiency in the use of resources by businesses.

It also appears to this reviewer that the present definition of debt, *viz*, borrowings repayable not earlier than five years, for purposes of governing debt-equity ratios is illogical and arbitrary. Madan's study does not examine this problem in depth. If the object of regulating the use of debt is to keep the debt servicing burden within safe limits, the regulation should apply to all continuous debt (excluding purely seasonal borrowing), whether formally long-term or not, such as the revolving bank credit. In fact, such short-term debt, which the present regulations leave out, constitutes a greater danger to the solvency of enterprises than long-term debt. The interest burden of such revolving debt is no less onerous than that on long-term borrowings. In the Western countries generally, the practice with respect to computation of debt ratios is to take into account the whole debt rather than long-term debt alone.

As regards classification of preference shares, Madan's stand is rather ambivalent. In the first place, it is quite a contradiction to treat short-maturity (less than 12 years) preference shares as debt while excluding short-maturity (below five years) borrowing from the definition of debt for regulatory purposes. Secondly, in the case of preference shares of whatever maturity, redumption is permissible only if equity funds can be substituted in their place, either by way of retention of profit or by way of a fresh issue of shares. Hence, for purposes of debt ratios, preference capital is part of permanent equity: it cannot be taken out from the enterprise without at the same time being replaced by equity. The present classification is completely misconceived.

The study appears to have missed the opportunity of driving home some simple truths and clarifying government's thinking on the several issues involved in this problem.

A final comment may be offered about the role of Capital Issues Control in the matter of debt-equity norms. Madan's study does not discuss whether Capital Issues Control need at all concern itself with debt-equity ratios. It is time to consider whether it will not be more appropriate to leave the evolution of lending norms to the lenders themselves who will, in any case, have to take lending decisions in the light of their own experience and assessment of situations. No debt-equity ratio becomes safer simply because the Controller of Capital Issues has prescribed it.

Imperialism and Unequal Development

Vinod Vyasulu

Imperialism and Underdevelopment by Samir Amin; Monthly Review Press, New York and London, 1977; pp 267, $ 12.95.

SAMIR AMIN hails from Africa and it is from this peripheral region that we have this already well known major breakthrough in Marxism. Amin can justifiably be considered one of the most important theorists in Marxism today and in Africa he is the present representative of such distinguished predecessors as Fanon and Cabral. Africa is also the region which has seen tremendous progress in revolutionary struggles, for example in Mozambique, Gunieau-Bissau, South Yemen, Zimbabwe and of course South Africa.

In his earlier book, "Unequal Development", Amin expounded the thesis that "when a system is outgrown and superseded, this process takes place not, in the first place, starting from its centre, but from its periphery".[1] The breakthrough in marxism that Amin represents, emerging as it does from the peripheral capitalist system represented by the continent of Africa, is further support to his hypothesis of unequal development. In his earlier book he had explained this theme with respect to both the birth of the capitalist system and also its current crisis. The book under review consists of some of the papers that were subsequently written in connection with the discussions provoked by the earlier book. (Some important related papers, such as Samir Amin's analysis of the New Internatio nal Economic Order, do not appear in this book.) It is therefore difficult to either review or read the present book on its own. But, even if one were to do so, it provides stimulation and gives one a vista that is tremendously exciting if it is viewed, as Amin suggests, in relation to the "general perspective of the rebirth of materialism which itself flows from the radicalisation of the anti-imperialist struggles" (p 1). There is, of course, no substitute for careful assessment and critical study on such major issues as those that Amin addresses. Such critical debate, based upon the specifics of the Indian situation is essential, and it is heartening to note that Indian scholars such as Ranjit Sau, have begun such discussion.

The book is divided into four parts: part one on historical materialism, capitalism and socialism including three papers: part two is on imperialism and underdevelopment and contains four papers; part three is on problems of transition and the building of socialism and once again contains three papers. In addition there is in part four a freshly written introduction and an erudite conclusion entitled "The end of a debate". There is a mathematical appendix which the average reader may skip and which, although it recognises the many limitations of non-dialectic mathematical treatments is used very effectively to make explicit what is already implicit in the discussion. As Amin says, other models and other assumptions can of course be constructed; the objective of the exercise is simply to illustrate rigorously and quantitatively (within limits), the earlier results of following the method of historical materialism. In this use of historical materialism Amin places himself squarely in the rebirth of Marxism that is now going on. He insists that the method of basic social sciences is not that of economic theory or any other compartmentalised discipline but of historical materialism (p 236 and elsewhere). From this emerges the basic premise that characterises the volume — the class struggle which determines the paths of development/ underdevelopment / revolution. Class struggle and its elucidation are the unifying elements in all the papers. For particularly interesting treatments see the treatment of education, ideology, technology and technology transfer and also that of cultural spheres in this volume. The terse style makes heavy but always profitable reading.

The main crisis of the world today, according to Amin, is imperialism, which emerged around 1880 along with

the monopolies and this imperialism is not to be confused with colonialism or expansionism. Imperialism, which is the result of the growing centralisation of capital, tends to aggravate uneven development. The principal contradiction of the capitalist system then tends to be between monopoly capital and the over-exploited masses of the periphery. At the centre the social formation tends to be reduced to the capitalist mode of production. The backward seotors such as small and medium size entrepreneurs are gradually eliminated and as this elimination takes place the social democratic alliance gains strength and becomes the main enemy. In the periphery the formal submission of other modes of production places narrow limits on the development of productive forces. The centre of gravity of these struggles against capital as a class tends to shift from the centre of the system to periphery. Thus, the working class at the periphery becomes the essential force of liberation. In coming to these conclusions, Amin uses rigorous and persuasive logic based on historical materialism and transcending a West-centered European outlook. The importance for the periphery lies in the bridge that has been built between imperialism and underdevelopment and the implications this has for strategies of class struggle, especially its anti-imperialist content in both centre and periphery.

One of the central themes in the book is that of unequal exchange which was sparked off by the publication in 1971 of A Emmanuel's book on the subject. Unequal exchange exists under imperialism and by it is meant the situation in which international specialisation is rooted in the unequal rates of exploitation of labour power through-out the world system (p 128). What is sufficient for this form of unequal exchange is that commodities are produced for the international market. It is not necessary for the capitalist mode of production to dominate the different social formations in *all* spheres. Under imperialism and in a situation of unequal exchange, the wage rates in the centre and periphery are different for labour of the same productivity, often by a factor of 1 to 5. The related analysis is far superior to the neo-classical theory of trade that dominates our popular text books.

The debate over unequal exchange is reviewed and related to issues such as the falling rate of profit, the transformation of values to prices, etc. These are areas in which Amin, as the title of the concluding part shows, believes that the debate has been closed. But in doing so he is not suggesting that we rest on our laurels but is calling for fresh studies based upon history, related to the class struggle, on matters which should be of prime importance — for example, sub-imperialism. This is a theme which should be of particular interest to students of the social formation in this country, especially in view of the fact that many have identified India as one of the few countries with a sub-imperialist potential.

The great importance of Amin's work lies in his transcending the Euro-centric vision that has dominated recent research, including Marxist research. This shows up most clearly in the discussion on capitalism and ground rent. For example, since rent is not a capitalist category he tries to follow up the relationship of the modes that include rent to those that do not in the course of capitalism's history. It is this kind of historical study that is badly needed in order to properly understand the nature of past class alliances. In this illuminating essay there are a number of important insights on this and related questions.

Of particular interest to economists is the criticism of micro-economics, particularly his scathing attack on cost benefit analysis which he destroys totally, in contrast to the earlier attempts in this direction made by other writers.[2] Amin's contribution lies in his having extended the argument in such a way that the efforts of others can now be seen in the correct perspective. By using, for example, the question of a time horizon and pointing out that micro-economics is incapable of taking a long time perspective, Amin demonstrates the ideological and class character of micro-economics. He shows (p 46) "how a man as intellectually poor and underdeveloped as Samuelson was able to become an authority" in this field. He renders a signal service to economists who have been struggling against the perverse results that this "neutral" technique throws up. For example, he points out (p 29) that a rate of return of the order of 7 to 15 per cent means that the time reckoning of economic decision making is very short because at the rate of 7 per cent per year the value is reduced by half in 10 years and that at the rate of 15 per cent in less than 5 years. "It is characteristc that in the capitalist system the only sector which considers decisions over a longer time is the military sector. This is because in this field there is a need to consider the evalution of the international balance of power over a longer period. It is a question of survival or at least of the place of the nation in the world. This is something too serious to leave out of short term interest."

The point that emerges is that what we need is not project evaluation and social cost-benefit but a clear understanding of class struggle.

In order to get the best from Amin it is necessary to read the book under review in conjunction with at least two of his earlier works, "Accumulation on a World Scale" and then "Unequal Development". In "Accumulation on a World Scale" Amin discusses the unity of the capitalist system at the international level and the need to use the category of world values, that is of commodities produced for the international market. (It is interesting to note in passing that the Little-Mirlees criterion on project evaluation suggests that when market prices in third world countries are distorted recourse should be had to international prices. Need the class basis be more clear?)

In "Unequal Development", Amin went on to a detailed study of peripheral capitalism in the context of imperialism and the dynamics of the social formations where the peripheral capitalist mode dominates other modes. It is in this context that the papers collected in this book arose. The date at the end of the debate is September 1973. It has taken five years for this discussion to reach us. And we have no idea today about the theories of the Amin of 1978. It is, however, a hopeful sign that books of this type can become more easily available to us through the newly set up Social Scientist Press. It is to be hoped that this Press will make easily available in India the works of Samir Amin.

In conclusion, in reading Amin we realise that there is a lot of rethinking and rereading to be done. From him we may rediscover Marx, the Marx who thought of class struggle, commodity fetishism, reproduction of the system, etc, in terms of historical materialism, rather than the Marx who has been reduced by the various schools into a rigid mold. It is in this context that Amin speaks of transcending eurocentrism and linear and mechanical logic. Even if these were to be true in part, Samir Amin's contribution would be most important in recognising the need for thinking along historical materialistic lines and in deciding between different strategies of

revolutionary struggle. This is Amin's main concern. After all, Marxism is neither an "economic theory nor sociological theory nor a philosophy but the social science of revolutionary socialist praxis".

Books in Brief

World Modelling: A Dialogue edited by C West Churchman and Richard O Mason, TIMS Studies in the Management Science, Holland; pp xv+163, Rs 115.20.

Rats, lice and mice
shit
we can all rest
assured that
one man's output is
another man's input
equality is equivalent to evacuation on
a grand scale.

IT is with such profoundities that the editors seek to establish a dialogue about world modelling. Socio-economic modelling indeed is a fascinating hobby-horse. But it has far reaching consequences when policy qualifications are made from it.

A critique of the theory of modelling can be made on two levels: one, the purely logical form of the system; and two, the external validity of the system. While the internal logic of the system would follow directly from the assumptions made in constructing the theory, what may be of more interest is the validity of these assumptions. This is so because the choice of not only variables but also the techniques involved is a political task.

The book is very 'club of Rome-ish' in its approach. Richard O Mason begins by telling the reader that "whatever one thinks about the method or its conclusions, 'Limits to Growth' has become a way of thinking about the world's problems" (p 2). From then on, opinions vary, from Hasan Ozbekhan waxing eloquent about "the predicament of mankind" to Jay W Forrester "refuting the major criticism of Forrester-Meadows work" (p 5). And despite liberal questionings — "Can we model the wild world or should we first tame it?" (p 107) — the book remains a hotch-potch of arguments in favour of Club of Rome activities. Hasan Ozbekhan, by the way, had written the original prospectus of the Club of Rome.

It might really be true that mathematical formulations provide greater precision and power than do less rigorous forms of discourse, and they may provide connections between diverse pieces of research or of theory. But what matters is the 'value-base that governs the whole activity of socio-economic modelling right from the beginning. That it has every possibility of becoming apologetic in nature is evident from what Hasan Ozbekhan has to say about it, probably without fully really realising its implications:

> First, it [modelling] must qualify as a tool-concept that can be used throughout the study. Secondly, it must be consonant with the initial perceptions and beliefs that have triggered the effort. Thirdly, *it must support, and in some sense justify, the outcomes that are expected from the work* (emphasis added).

One does not really doubt the use of mathematical modelling as a tool-concept; one can write a set of differential equations about almost anything. But the point is: a tool for what? The answer lies in the third reason — it must support and justify the expected outcomes. The knowledge of the output affects the assumptions of the input! Feed-back loop indeed, but like a dog chasing its own tail.

The only redeeming feature of the book is the article "can we model the wild world or should we first tame it?" by Claude Faucheux and others. They agree that "today's models are extrapolations of past trends, present values and attitudes, with no attempt to incorporate changes — drastically new environmental conditions, learning, the development of new needs, etc". This is indeed the reason why such models become an apology for the *status quo*.

It might be worthwhile to note here the spurt in socio-economic modelling activities and the apparent concern for 'the future' in India. The Department of Science and Technology already has a futurology panel. There is also a Futurology Society of India. It is pertinent to make a note of these activities because they may really be no more than receiving *gyanam* with folded hands from the messiahs of the Club of Rome. And this activity is no less respectable than astrology, the great science of future — India's contribution to the world.

The book is indeed very useful for those who have already taken up the profession of Futurology and the kith and kin of astrologers who would like to grant their profession the sanctity of computerised techniques.

— Bharat Bhushan

Cost-Benefit Analysis by E J Mishan (2nd Edition); George Allen and Unwin, London; pp 454, £6.95.

THE world has come a long way since Kurtilla and Eckstein published their work on "Multiple Purpose River Development" in 1958. The book was a pioneering effort in the field of cost-benefit analysis (c b a). When the first edition of E J Mishan's book on "Cost-benefit Analysis" was published in 1971, the discipline received a well needed boost and economists and planners started taking a harder look at the spilt over and spread effects of investments. Mishan's approach to the subject was deeply influenced by the view that "cost-benefit analysis is an application of welfare economics" and that "more particularly the rationale of cost-benefit analysis is based on a potential Pareto improvement". In the second edition Mishan has elaborated his approach to c b a further and has brought the scope of the technique into sharper focus. According to him, c b a is primarily useful as a technique for identifying the project mix which can optimise satisfaction in terms of certain pre-set objectives. The parts of the book on concepts of costs and benefits, external effects, uncertainty and investment criteria have been thoroughly revised and the 'conceptual basis of cost benefit criteria' has been further elaborated in response to the criticism of the earlier presentation by James Meade.

Part I of the present edition, as of the first edition, presents certain simplified examples of cost-benefit studies. One wonders whether these examples deserve separate treatment in a treatise on cost-benefit analysis. Note 'A' of Part VII of the book, which deals with the welfare-basis of cost-benefit analysis, also appears to be unnecessary in a text-book on c b a. Notes 'B' and 'C' of the same part can usefully be integrated in the main text instead of being lumped together at the end of the book. Structurally the book gives an impression of being three books in one, rather than a single book on the discipline of c b a.

In Mishan's presentation of c b a "Consumer's surplus is the most critical concept in the measurement of social

benefits". Next comes shadow pricing. Mishan considers shadow pricing of factors or goods as an essential ingredient of analysis. Shadow price is defined as "the price, the economist attributes to a good or factor on the argument that it is more appropriate for the purpose of economic calculations than its existing price if any". Spill-over effects, whether positive or negative, constitute another aspect of project impact which cannot be ignored in cost benefit evaluation of a project. Spill-overs have to be valued "according to independent economic principles". Deriving a value from some other principles such as the political decision-making process is to adopt "a principle that is inconsistent with the Pareto criterion on which the estimates of other, more measurable items are based". Mishan suggests that the rate of discount employed for deciding whether to admit some specific public investments on the basis of unmodified discounted present value should be "the average per annum opportunity rate at which the capital sum invested would grow in the best alternative in the private sector".

The second edition of the book is certainly an improvement over the first edition both in the matter of structural consistency and clarity of exposition. As time passes and more experience in the field becomes available, it is hoped that the technique will be further refined and will serve as a useful tool for all those who are involved in the processing of development planning. Even as it is, the book should find wide acceptance amongst planners, administrators and students of development economics and management.

— P K Mattoo

Rajasthan Spinning

RAJASTHAN SPINNING is paying 10 per cent for the year ended September 1978 on the capital doubled by issue of bonus shares as against 15 per cent paid last year on the old capital. The company has earned a lower gross profit of Rs 113 lakhs against Rs 136 lakhs for the previous year, although total income was slightly higher at Rs 24.67 crores, against Rs 23.84 crores. With no tax liability, net profit is Rs 74 lakhs (Rs 98 lakhs). The proposed dividend on equity and preference shares will require Rs 22 lakhs. The company's schemes for modernisation and expansion, estimated to cost Rs 4.01 crores, have been approved by the financial institutions.

Towards a Study of Education and Social Change

Karuna Ahmad

The sociology of knowledge may throw light on some of the perplexing aspects of the relationship between education and social change. For instance, the role of the educated Indians in the national movement for independence has been outlined time and again, but this remains an impressionistic observation. The role of the content of curriculum, the organisation and the transmission of knowledge may give us more reliable and interesting data. More research ought therefore to be undertaken by sociologists in this hitherto unexplored area.

This will also enable us to distinguish between social changes at the structural level and those at the level of ideas, values or attitudes or what the author calls 'ideational' change. Structural changes are more likely to be generated by politico-economic factors and ideational change can bring about stability in such a situation.

I

A RADICAL reconstruction of the educational system has been a persistent theme in discussions of education in India since Independence. We had expected that education would play a vital role by initiating the desired process of social change. The expectation that education would inculcate the skills and training necessary for a scientific and technological revolution as well as the values for social justice, equity and national integration was thus highlighted in most of the official documents. A link was sought to be established between education on the one hand and national development, prdouctivity, and growth, on the other. To quote from one of the most important of these documents:

> If this change on a grand scale is to be achieved without violent revolution ... there is one instrument and one instrument only, that can be used: EDUCATION. This direct link between education, national development and prosperity which we have emphasised and in which we deeply believe exists only when the national system of education is a revolution in education which in turn will set in motion the much desired social, economic and cultural revolution ("India, 1966": 4-5).

This expectation has been waning gradually. Those who were earlier inclined to place trust and responsibility on education are perplexed and disappointed after 30 years. They are now thinking of alternatives to the existing system of education and are promoting non-formal education as an instrument of much-awaited social change. Therefore, it is imperative that we critically examine the relationship between education and social change.

Education and the social system are closely interlinked and their mutual interaction is critical to an understanding of this relationship. We should ask whether the failures of the educational system were due to its inherent weaknesses, or whether we should look for answers to the wider social system of which education is a part. The questions that require answering in this connection are the following: What is the relationship between education and social change? What are the conditions under which education can generate or initiate social change? Again, how is social change to be brought about by education? It is the contention of this paper that hardly any thought has been given to asking these relevant questions.

Sociologists in India have been mainly interested in the modernisation and development aspects of social change but very few amongst them have written directly on the precise relationship between education and social change. Even so, a perusal of the social science writings shows that three viewpoints are discernible on this relationship. The first view is represented by those social scientists who, using the Marxist framework, assert that change in or through the educational system is not possible without prior changes in the social structure. The second view is represented by those who are using the functional framework and do not, therefore, establish the primacy of any one factor over the other. Most of the sociologists fall in this group. While the Marxists look at education as a purely dependent variable, these latter group of scholars treat education as external to the process of social change. Drawing their analogy from the highly developed countries, they assume that education is the main determinant of economic growth; they depend, to a large extent, on manpower planning to meet the economic and educational needs of the society. Education is treated by the proponents of this view as a relatively independent component of the development process so that it could be organised and planned to provide the levels of training and values needed by the society. "In a world based on science and technology, it is education that determines the level of prosperity, welfare, and security of the people ("India, 1966": 1).[1] Finally, the third, and a more recent, view is that transformation in the social and educational system should be simultaneous.

The contribution of all these viewpoints lies in making us aware of the relationship between education and society and in pointing out that society puts constraints on education. The central thesis of this paper is that formal education is a social product. Its form is determined by the type of social change which the rest of society is undergoing. It acts independently of the social structure only through the transmission of knowledge, ideas and values.

Therefore, there is need to distinguish between what are called 'structural' aspects of change from 'ideational' aspects of changes. After all, the role that education plays in social change is crucial in the area of value-transmission, attitudes and knowledge. I refer to these as 'ideational' changes. Again, there is need to differentiate between social change which is generated by the politico-economic factors and precedes changes in the educational system, on the one hand, and the change which

is generated through education. This will instill realism into the thinking of those who place too much faith on education.

There is also need to see the contradiction in the role assigned to education. It is expected to transmit the cultural heritage and provide continuity with the past while at the same time building a new social order. The planners and policy-makers fail to see that education is very much a part of society and is subject to pressures from other parts. For example, while the society is highly inegalitarian, the educational system alone cannot inculcate values of equity and social justice. It it does so, then there is likely to be resistance from various groups — be they parents, administrators, or politicians. There is likely to be conflict between the values imbibed in the family and community and in the school. Besides, this conflict is likely to be heightened in a society where private schools, by their very nature, are established to promote sectional interests.

This paper shall attempt to do two things. First, it shall try to show that educationists, planners and policy makers have failed to take note of these complexities suggested by the sociological perspective. They have placed too much faith on education which was, by and large, misplaced. I shall argue that the failure of educational system is not due to its 'inherent' weaknesses as to the characteristics of the social structure, a point which has been highlighted by sociologists elsewhere. I shall substantiate these observations through a study of the role of education in promoting social inequality in India.

Second, since I contend that education acts as an independent variable of social change only through the transmission of knowledge, ideas, and values, I shall argue that the sociology of education must look beyond the frameworks it has been using so far and seek answers in the sociology of knowledge. Instead of concentrating on the structural aspects of education, *viz*, social stratification and mobility, etc, we should now begin to ask questions about the role of ideas in change. This will turn our attention to a study of the content of education, to curriculum formulation, to language and the medium of instruction, and to the organisation and transmission of knowledge. This will also help in identifying the various groups involved in the decision-making process in education. Through focusing on these issues we will be better able to answer questions such as: which values and whose values.

II

British rule ushered in India during the nineteenth century far-reaching social changes which included, among other things, the introduction of a rational and secular educational system. It differed in many ways from the traditional system of education prevailing in India at that time. The most notable differences related to the admissions procedure and to the organisation and content of education. For the first time in the history of the country, education became, in theory, open to all irrespective of birth. It thus enabled the lower castes and women to take to education. Secondly, the literary and sacred education of the Brahmins or priestly castes and the very functional education of the trading castes were replaced by the secular and British system of education.

The social consequences of this new system were many. For one thing, it created a new educated elite in the country as education came to acquire significance as the decisive instrument for achieving status in society. English as the medium of instruction further enhanced the status of those who received this new education. Secondly, education became linked with occupations in the administrative and the judicial set-up. Therefore, it also became a vehicle for job-acquisition. Thirdly, those sections of Indian society who were earlier denied education on grounds of caste and sex were able to enter the educational system (see Seal, 1968; Misra, 1963; Basu 1974; McCully, 1940) as early as the last quarter of the nineteenth century.

No doubt this happened on a comparatively smaller scale. Their representation continued to be low till 1947. Education was largely confined to urban males of the upper castes. Women and lower castes received education in far too few numbers. Therefore, the new education remained confined to a small stratum. However, it was not the size that was important but the fact that the new system could break the centuries old monopoly in education of the priestly and other high castes.

Fourthly, while increasing the gap between the educated elite and the masses, it brought together those Indians who had been exposed to the Western secular and liberal ideas. These were the people who, later on, led the national movement for Independence in the country. They also spearheaded movements for social, religious, and political reform in various parts of the country. (See Desai, 1967; Worseley, 1964; Seal, 1968; Misra, 1963; Basu, 1974; Heimsath, 1964.)

At the time of Independence, the national objective in education was to develop a system of national education. It meant, among other things, universal free elementary education, removal of adult illiteracy, adoption of Indian languages as media of instruction at all stages, vocationalisation and diversification of secondary education, and special attention to the backward sections of society, such as women, scheduled castes and scheduled tribes. Two of these tenets were also enshrined in the Constitution as directive principles of sate policy: the provision of universal elementary education by 1960, and the promotion of the interests of the underprivileged sections of our society.

Let us now look at some of the developments in education during the last 30 years. The most notable feature of the post-Independence educational system is its phenomenal expansion. The impact of this expansion was felt at all levels of the system. The growth and expansion of education his been enormous in size (Kaul, 1974: 1-15). This expansion has undoubtedly benefited almost all sections of our society although the share of the benefits differs according to location (rural or urban), sex, and socio-economic status. The chief beneficiaries of this expansion have been the middle sections of our society in the urban areas. In the rural areas, the landowning groups and the middle castes have taken greater advantage of the new opportunities (Kamat, 1973:313).

However, despite quantitative expansion, the educational system suffers from serious drawbacks. For example, even in 1978 we are nowhere near achieving the target of providing universal elementary education.[2] Further, the progress of literacy has been very slow. Moreover, the number of illiterates is growing.[3] Again, there is no nationwide movement to introduce adult education on a large scale as is being done in some countries of Latin America. We have yet to grasp the fact that the problem of illiteracy will have to be fought through adult education.[4]

Moreover, the pattern of educational expansion is linear (ICSSR, 1977:5). Thus, its impact is felt more at the higher than at the elementary level. For example, the increase in enrolment

has been more rapid in the former than in the latter. The expenditure on elementary education is also the least, while secondary and higher education claim the largest share of the educational budget — receiving 60 per cent of the total educational expenditure (ICSSR, 1977:5). Therefore, the extent of subsidy is much higher at the secondary and higher educational levels than at the elementary level. Further, this subsidy differs not only according to the level of education but also according to the type of education. For instance, it goes up in the institutions of professional education which are more prestigious and which lead to better paid jobs. Furthermore, most of the expansion at the higher level has been in general education, thereby increasing the number of graduates who are not trained for specific jobs but queue up for clerical and other supervisory positions in the expanding bureaucracy.

The contribution of the private sector at the secondary and university levels has considerably increased, despite higher subsidy from public funds. The social and political implications of the role of the private sector in education have been explored by some social scientists and have been mentioned briefly in this paper elsewhere. Suffice it to say here that it has created a dual system of education wherein the educational institutions run by the government, providing free elementary education and using the regional languages as the media of instruction, form the inferior stream, and the private institutions using English as the medium of instruction and the institutions of professional education (e g, the IIT's and colleges of medicine, etc) receiving huge State subsidies, form the superior stream of education. The implications of this dual system for various sections of our society will be discussed presently.

Most surveys by sociologists have brought out the point rather forcefully that the majority of students in our country are from the upper and middle strata of society. I discuss this in detail in the next section. Suffice it to say here that the educational system has not only increased the social inequities, it has also created them where none existed before. The constitutional objective of an egalitarian society is thus far from being realised. Therefore, it is imperative to take a close look at the contribution by education to equality of opportunity in our society. This will enable us to appreciate the nature of our educational system.

I should like to stress that the educational system could not have promoted the type of social change which it was expected to. I shall confine myself to this area for two reasons. One of the dominant themes in educational reform during the last 30 years has been the extension of educational opportunities to wider sections of our society. In general, it meant free schooling, scholarships, and maintenance grants for needy students, reservations of seats in the educational institutions and of jobs in public sector undertakings. In particular, this is the policy of positive discrimination which was adopted by the Constitution. The objective of all this was to provide equal educational opportunity. The thrust of the programme in education was, therefore, expected to be in the direction of equality. This is therefore the best point of departure for elucidating the relationship between education and social change in India. Secondly, the main contribution of sociologists to educational studies is to the relationship between patterns of stratification and educational opportunity. Social historians, too, have provided similar data on the British period. Therefore, it shall be possible to substantiate my arguments from social stratification much more easily than in any other area.

III

Our Constitution enshrined democratisation as one of the main objectives of education and anticipated that the democratic expansion of education would serve social and economic mobility. The Education Commission noted:

> One of the important social objectives of education is to equalise opportunity, enabling the backward or underprivileged classes and individuals to use education as a lever for the improvement of their condition. Every society that values social justice and is anxious to improve the lot of the common man and cultivate all available talent must ensure progressive equality of opportunity to all sections of the population. This is the only guarantee for the building up of an egalitarian and human society in which the exploitation of the weak will be minimised ("India, 1966":108).

Given this optimism, one is tempted to ask if the expansion of opportunities for the underprivileged groups has had the ameliorative and equalising effect anticipated by our Constitution-makers, or whether newly created educational opportunities remain restricted in terms of social and economic status.

Since Independence the proportion of the scheduled castes in educational institutions has increased rapidly as a result of the encouragement offered to traditionally underprivileged sections, changing socio-cultural attitudes, and greater investment in education. However, most of the students in our country are from the upper and middle strata of society.[5] In fact, the higher the level of education, the higher the status of the students. Therefore, there is a close correspondence between the social background of the students and the level of education. The inequity in access is related also to the type of institutions. For instance, the lower strata tend to pass through the inferior stream while the better-off sections monopolise the more expensive and prestigious institutions. Furthermore, within these institutions, there is close congruence between the social background and the discipline of one's choice. The students from upper and middle strata tend to dominate those courses which lead to the better paid and the more prestigious jobs. Thus, there is a vicious circle of inequity. According to Naik,

> The entire educational system has been oriented... to meet the requirements of the top one-third of the population (the well-to-do sections, and the upper and middle classes in urban and rural areas) and the interests of the poor (who form the lower two-thirds of the population) have, by and large, been ignored (1974:6).

In fact, the educational system in India did not make a radical departure from the one which the British had implanted here. One has heard and read about the problems of educated unemployment, limited access to the underprivileged or rather selection at all stages, etc, for the last century or so (McCully, 1940; ICSSR, 1977; Kamat, 1977). Some of the earlier imbalances continue to characterise the educational system of Independent India. We have not so far been able to correct these imbalances.

A number of studies have also appeared on the socio-economic conditions of the scheduled castes and the impact of the policy of positive discrimination upon them.[6] These studies have shown that the spread of education among the scheduled castes has been slow compared to among the non-scheduled castes. Further, they have indicated that the growth of education has not been uniform among them taken as a whole (see Patwardhan, 1973; Chitnis, 1975, 1977; Shah and Patel, 1977). Their capacity to utilise the privileges offered by the government has tended to vary from one sub-group

to another. Thus, a small sub-elite among the scheduled castes has been benefiting from the policy of positive discrimination while the large majority of these communities have lagged behind. Studies have also shown that, while there has been a tremendous increase in their numbers, the representation of the scheduled castes in education is lower than their proportionate representation in the population and the students from these underprivileged groups tend to attend 'inferior' or less prestigious institutions. Moreover, their proportion in some of the less prestigious courses also tends to be higher so that the likelihood of their getting prestigious and highly paid jobs remains thin (Chitnis, 1975; Neelson, 1972; Rao, 1976; Naik, 1971).

Thus various levels of inequity can be identified within the educational system. It is being stated that "the school systems ... reflect and, in turn, reinforce the inequalities in the social structure" (Myrdal, 1968: 1978). This makes it quite obvious that the impact of education on social stratification, or on social change by reducing social distance among the strata in our society, has been very limited.

Now the question arises: Why has education failed to equalise opportunity and thereby equalise social status? Did we provide the extra supports needed by education to bring about desired changes? The answer to the second question is clearly in the negative. We have already referred to some of the features of the educational system that have a bearing on this question. We noted that the educational system continues to expand vertically, though its horizontal expansion at the elementary level is imperative to enable the poorer sections of our society benefit from education. The eradication of mass illiteracy through adult education has also not received priority. Even now higher education receives proportionately more funds than elementary education. The existence of the dual system of education along with the fact that education, despite huge subsidy, continues to be expensive for the poor are deterrents to the realisation of the goal of equality.

The first question leads us to society and also to the misplaced faith of planners and policy-makers. Researches on equality demonstrate a circular causal relationship between social and economic inequality on the one hand and inequality in educational opportunity on the other. For one thing, the latter seems to be reinforcing the former. "Education", states Myrdal,

> is probably the most fundamental monopoly element in an inegalitarian social and economic stratification. At the same time, this kind of stratification makes it more difficult to democratise education because of the unchallenged power of a small minority of the educated and articulate, who have vested interests in preserving their position (1968: 1805).

So far, we have elaborated some of the characteristics of the Indian educational system to illustrate the point that education is closely intertwined with society. Therefore, the Indian educational system should not have been expected to rise above it and generate changes which were not supported by factors of change in the rest of society. Now, we will proceed to argue that we have to go beyond this perspective to look for answers to the complicated relationship between education and social change.

IV

Eggleston has noted, "... the study of social change is handicapped by the theoretical uncertainty and the practical difficulty of formulating and testing useful hypotheses" (1974: 12). Although the relationship between education and social change has been a theme of considerable theoretical and practical interest, we are nowhere close to a satisfactory conceptualisation of that relationship. The principal difficulty in this connection has arisen from the fact that education is simultaneously the cause and the effect of social change. It is a product as well as the process. This makes it difficult to outline its role in social change. The difficulty is heightened by the fact that the theoretical frameworks used so far for understanding that role have tended to emphasise only one or the other of the two aspects of education. For instance, purely economic deterministic positions, while treating education only as an instrument of social change, lack any scope for explaining 'ideational' changes, and the role of education in knowledge dissemination. Equally, the analogy which posits a direct relationship between education and economic growth lacks realism. The use of this approach in developing countries is fraught with uncertainties and failures. It fails to take note of the differential stages of growth of societies. The problem is further complicated by the fact that educational expansion in our country cannot be explained simply in economic terms. Social factors are also very crucial (Roberts, 1973: 148). This approach is unable to explain away the effects of education while looking at education as a condition of development and social change.

The lack of research in this area from a perspective which would lend realism to the outlook of the planners and policy-makers has also been responsible for our failure to understand the complexity of the relationship between education and social change. Sociologists in India too, except perhaps those using Marxist frameworks, have not come to the aid of the educationists, planners and policy-makers. As indicated earlier, most of them have tended to depend heavily on the position which imputes an overwhelmingly economic position to education. They have failed to project the view that our country is at a different stage of development and, therefore, the role of education may differ or that the close link between a rapidly expanding educational system and the economy could be maintained only in certain conditions, or that our priorities may be different from those in other countries. Moreover, political considerations are crucial and further complicate the relationship between the two. Politics, apart from economic factors, are significant in determining the uses and abuses of education in a democracy.

It has been stated earlier that the optimism about the role of education in social change is evident in the writings of educationists, planners, and policy-makers. Although sociologists elsewhere have, by and large, been taking the position that education is so intermeshed with society that most of the time it cannot rise above its constraints and limitations "this fact", as Kamat has stated:

> ... has been unfortunately ignored by most of our educationists, and policy-makers and planners all these years, and particularly by the 'pure education-wallahs'. The latter were busy, many of them still are, with merely making fresh plans every few years, and suggesting what they consider to be suitable educational technologies to accomplish them. For instance, you will hardly find any of this analysis in the great report of the Kothari Education published only nine years ago. It is only now that some of them are taking the turn, some of them still haltingly, calling it a drift (Kamat, 1977a: 18).

Those in charge of education have failed to see this. Nevertheless, it is quite clear that so long as society is unequal and certain other forces are not unleashed to promote equality, education alone cannot achieve much. That is why one is likely to view with

scepticism the more optimistic claims to reform society by somewhat limited changes in school reorganisation. It is unlikely, for instance, that either the changeover to the 10+2+3 system or even to non-formal education or the abolition of public schools will succeed by themselves in introducing radical changes in our society. If the objective is equalisation of educational opportunity, the minimum that is required is that we spend more on adult education and elementary education than we have done so far. Moreover, the dual system of education should not be allowed to continue. Private enterprise in education seems to negate the very idea of social and distributive justice, equality and quality (see Madan & Halbar, 1972: 147; Dibona, 1974; 158-159; Gould, 1972: 102; Desai, 1967: 118-119; Myrdal, 1968: 1707, 1801; Seshadri, 1976: 225-229). The huge subsidy at the secondary and higher level should be discontinued particularly when it is not even being utilised to evolve an educational policy. As Myrdal states:

> It is strange to find that there has been so little constructive discussion of the fees system. The discussion has most often focused either on the desirability of lowering the fees ... or on the necessity of retaining the fees .... Regulation of fees as the means of guiding students in a planned direction — for instance, away from general secondary schools to vocational ones has not been raised as an issue. Nor has the regulatory power of the state authorities — granting permits to operate schools, issuing directives, and placing such schools under state inspection — been used for purposes of educational policy other than to guarantee a minimum level of quality for teachers and facilities and rarely even then. With all the emphasis on planning ... it is almost incredible that in the educational field there has, in fact, been a *laissez-faire* attitude — except for pressures to enlarge the school system so as to accommodate more pupils (1968: 1712).

I am not saying that the steps outlined ought to be taken *per se*. What I am arguing for is that, if the objective is equality of educational opportunity and if we want education to initiate changes in social stratification, then the above mentioned changes would appear to be imperative. The reforms in education have to be determined by objectives which will determine our priorities. Thus, the failure of education in equalising opportunity is understandable. What surprises one is that all the so-called ills of society should now be laid at the door of education. It is possible that all or none of these criticisms may be based on facts. What is clear is that our research has done very little to reveal them. Otherwise, how could one hope that the country would achieve the target of universal primary education in 10 years? Those very people who were depending on education for restructuring society are now unhappy being unable to realise that the fault was more in their misplaced optimism than in the drawbacks of the educational system.

In fact, had the educational system achieved what it was expected to — and that too under the existing constraints mentioned earlier — it would have been more surprising. Education, as it has been and continues to be, could only have promoted equality on a limited scale. The nature of social mobility could not have been different. In fact, the system is so designed that it could promote mobility for the few, not for the many. Again, education does not create jobs so it can also not be held responsible for unemployment. Or, if the educated persons dislike manual work, it is not a value of the educational system. It is a societal value which is being reinforced by the educational system (Myrdal, 1968: 1802). After all, even a farmer in the village who tills his own land has a lower status than the one who has it tilled by someone else. Besides birth, wealth, political power and, more recently, education, one's status in India is determined by what one actually does. The closeness of touch and degree of defilement are also important determinants of social status. Recent researches by social anthropologists in this area provide rich material to elucidate the argument.[7] The sociologists interested in education should turn to this area and try to provide answers to some of the much-heard-of problems relating to education and values.

V

The thrust of this paper thus far has been that education cannot contribute to social change independently of the social structure. This should not, however, lead us to suppose that it can make no contribution to social change. Education can be viewed as a vehicle for introducing a developing society to new needs and expectations and even to the idea of change itself. All this it can do through the transmission of values and by changing the attitudes of the people. In other words, education can help take our society away from the old, and towards the new, it can inspire a belief in change, in adaptability and achievement, and in rationality.

There are few studies relating education to change in attitudes and values in our society.[8] Even those done elsewhere do not provide conclusive evidence on the part played by education in changing values. Nevertheless, there is now greater awareness of the problems of research in this area. If it is combined with interest in such issues as the curriculum formulation and the content analysis of textbooks, etc, then we are likely to understand the relationship between education and social change. The main drawback of the sociology of education is that it continues to be concerned with the relationship between stratification or social background on the one hand and educational opportunity on the other. Little effort has been made so far to ask questions concerned about the genesis and transmission of knowledge.

Education involves selection and organisation of the available knowledge at a particular time. This process of selection consists of conscious and unconscious choices about what is to be transmitted and what is to be held back. The sociologist interested in education cannot afford to overlook the principles of selection and organisation underlying the curriculum. It is only by uncovering them and then relating them to their institutional setting and to the wider social setting that one can provide better and perhaps more precise answers to the contribution of education to social change through 'ideational' change. Furthermore, since education mirrors the ideology of the dominant group in a society, we must at least have some conception of the controlling groups both within education and in society at large. This will also enable us to uncover the decision-making processes relating to education and within education and to the study of how knowledge is selected, organised, transmitted and assessed in educational institutions. This area has so far been neglected by the sociologists interested in education.

Partly the failure of the sociologists interested in the study of education and social change to turn to the problem of genesis and transmission of knowledge — i e, to the sociology of knowledge in its extended sense — owes itself to their ideological and methodological assumptions. Partly it is also due to the institutional context within which the sub-discipline developed, particularly in India. It has been noted already that the sociology of education has relied from the beginning upon either Marxist or structural-

functional frameworks in their researches. We have already drawn attention to the drawbacks of purely economic deterministic frameworks in delineating the relationship between education and social change. The functional framework, too, has tended to focus on the problem of the structure of the educational institutions, namely, of social stratification. As Young has noted, those who are using this framework have not examined the social nature of education. For instance, the content of school curriculum in which pupils are exposed to several subjects bearing little or no relation to each other, or to the experiences of the pupils (1973:343). Neither those who are using the purely deterministic approach nor the functionalists realise that it is not only people but knowledge too which is 'processed' in educational institutions and that it is the interaction between people and knowledge that must form the starting point of studies on 'ideational' change.

As in the West, the sociology of education in India developed primarily from a sociological interest in demonstrating the relationship between the distribution of life-chances and education on the one hand and social background on the other.[9] Therefore, the sociologists who turned to the study of education started working on the social context of education, with an emphasis on social background (*viz*, caste, and parental occupation) and moved on to the consideration of the educational problem of the scheduled castes and tribes, and the implications of the policy of positive discrimination in education for their social and economic status.

Most sociologists who have worked on education in India have presupposed at a very general level an agreed set of societal values or goals. These values or goals are supposed to define both the selection and organisation of knowledge through curricula. However, the main concern of the sociologists is with the organisation and processing of people. For instance, it is assumed that curricula are defined by societal values. But questions like which values and whose values are not asked. These questions are likely to lead one to the identification of groups, the role of dominant groups in knowledge transmission, and the conflict between the values of these groups in the educational setting. Relation between power structure and curricula, between access to knowledge and the opportunity to legitimise it as 'superior', between knowledge and its functions in different societies. This perspective is also limited by the absence of an overall framework which will link the principles of selection of content to the social structure. Hence the neglect of questions such as how curricula are influenced by the values and interests of the controlling groups involved.

Therefore, what we need to do is to undertake extensive research with a focus on what goes into courses, what relationship the courses have to one another, what system of rewards and sanctions should be adopted, how time is distributed, and so on. Or, again, how these decisions are transmitted to students and teaching staff.

As Davies has observed:

> The entire exercise may be compared to a series of masques and anti-masques. What goes on behind the charades, the pageants and the masquarades is more important than the play-acting, but the structure of the play is what the various individuals and groups concerned use to make sense of these relationships. In some cases they may make no sense at all, while in others the masques and anti-masques may fit only too well. Thus Bernstein's type of curriculum structure approximates to the masques. *Institutional education, as much as politics, or religion, is an attempt to initiate students into the rituals of a dominant culture.* We need to study how effective the entire exercise is and which masques are provided for which subordinate groups and with what results (Davies, 1973:333-34, emphasis added).

Notes

[This is a revised version of a paper prepared for presentation at the 9th World Congress of Sociology to be held at Uppsala (Sweden) from August 14-19, 1978 and also circulated as Discussion Paper No 3 of the Zakir Husain Centre for Educational Studies, School of Social Sciences, Jawaharlal Nehru University, New Delhi.]

1 Since planning is crucial to this approach, deviations from this are looked upon as 'dysfunctions' that result from inadequate planning and resources. However, the failure of the planning policies and related manpower needs in developing countries have thrown the whole approach over-board. Therefore, the importance of education in economic development is being questioned. Moreover, experience suggests that so far as economic growth is concerned, education is more a dependent than an independent variable.

2 In 1975, elementary education was free for both boys and girls in all the 9 Union Territories of India. It was free for girls in 20 of the 22 states. In Meghalaya and West Bengal it was free for boys upto III and IV standards, respectively (India, 1976:40-43). The enrolment then stood at 90 per cent. However, these figures would be somewhat misleading if taken at face value. If one excluded from this figure those below and above the corresponding age-group (6-11) as well as accounted for the proportion of wastage, which is quite high, the effective figures would work out to about two-thirds of this age-group (for details see Kamat, 1977:13; ICSSR, 1977: 23-24).

3 The number of illiterates has risen from 247 million in 1961 to 307 million in 1971.

4 Recently, a high powered committee under the Chairmanship of the Minister of Education has been formed to look into the matter. A policy statement and an outline of the National Adult Education Programme (NAEP) has also been prepared. The NAEP has set up an ambitious target to cover 100 million adults (15-35 age group) by 1983-84. This will mean an increase in the annual coverage from the present 1.5 million to 35.0 million in 1983-84 (India, 1978:3). Whether this target will be achieved or not is a different matter. What is to be underscored is the thrust in the direction of expanding the programme of adult literacy.

5 For evidence on this point see Ahmad (1974:183-188), Shils (1961: 20), Misra (1963:54), Kamat and Deshmukh (1963:5-6), Desai (1953: 17), Shah (1964:19-22), Parekh (1966:56), Naik (1965:23, 108), ICSSR (1977:6-8), Kamat (1973, 324-28), Neelson (1972:73-74), Saberwal (1975:191-192), Jayaram (1977:184-185).

6 See, for instance, Oommen (1968), Dushkin (1972), Galanter (1972), Chitnis (1972, 1977), Karlekar (1975), Rao (1976), Sachchidanand (1977), Ahmad (1978).

7 The literature on caste values is vast. However, the general link between caste values and patterns of life style as well as attitudes to occupation and work would be quite evident from a perusal of Beteille (1965) and Dumont (1970).

8 Some of studies that have dealt with this theme are Singh (1972) Adams (1974), Faneuff (1974), Malik & Marquette (1974), and Shah (1964).

9 Most of the teaching and published work in the sociology of education has taken place in colleges, institutes and departments of education. Coupled with that is the fact that very few sociologists in India are involved in research on education. Till now it remains a secondary interest of most of them.

Rural Class Structure in Post-Independence Assam

Ranajit K Bhadra

Rural society in Assam is composed of various ethnic groups of both castes and tribes which have given rise to a peculiar social structure. Under British rule, this feudal society was rapidly transformed into a semi-feudal state, with considerable changes in the social structure. In British and post-independence periods, several land regulation and land reform measures have been enacted which too have brought about further changes.

An attempt is made in this paper to show how developments in post-independence Assam have brought about changes in agrarian relations, with a view to showing the emerging pattern in rural Assam.

AGRARIAN stratification in Assam is characterised by the landlords at the top and the landless labourers at the bottom. The tenant-cultivators occupy the middle position. The social organisation of the agrarian system gives rise to various patterns of works and property rights, privileges and duties of the different classes. The structure of agrarian production can be understood on the basis of three types of relations, namely, family labour, hired labour and tenant-cultivator. These three, however, can be found in the same family or unit, and hence it is difficult to identify different class groupings. Besides, these class groups overlap with caste divisions. Therefore, there are obvious lack of articulations among these class groupings to realise their respective interests.

During the post-independence period various changes have occurred in the agrarian sectors: (1) newly emerged agrarian groupings have altered the old class structure; (2) contractual relations have emerged; (3) since agricultural production is not for the village community only but, for the wider society, there has been a shift towards growing cash crops and commercialisation. Following these we may formulate the following questions: (1) what are the agrarian classes emerging in the rural areas? (2) what are the inter-relations among these classes? (3) how these class groups are distinctly indentifiable and do not overlap with other structural groupings?

Due to various changes in the tenurial system the relationships among the agrarian classes have changed considerably. *The Assam Adhiars protection and Regulation Act, 1948* regulated landlord-adhiar relations and gave security to the adhiars. *The Assam Acquisition of Zamindari Act, 1951* and *The Assam State Asquisition of Land belonging to Religious or Charitable Institution of Public Nature Act, 1959* gave tenants the right of self-cultivation and of ownership. *The Assam Fixation of Ceiling of Landholding Act, 1956* fixed a ceiling on landholding by an individual or a family at 150 bighas. These land laws had a greater impact in the Zamindari areas of Goalpara and Cachar districts where all the zamindars, except, a few, lost their land; but in the raiyatwari areas most of the medium and small raiyats retained their land.

The new land laws adversely affected the proprietors and other intermediaries of the lower income groups by terminating their rights who were also not given reasonable compensation. The laws are liberal enough to allow 133 acres of land under the possession of the big zamindars. Moreover, they are also allowed to keep 16 acres of land free of revenue. Thus after losing a considerable proportion of land the big zamindars are still in the highest position in the class hierarchy, whereas the petty zamindars, without enough land and without a permanent source of income have come down in the class hierarchy.[1]

Land is still a basic productive source in rural Assam, but it is not the only source of livelihood; the number of persons engaged in "production other than agriculture" and "salaried jobs" has been growing.[2] Absentee landlords are quite common in rural areas (specially in the ex-zamindari areas). They are educated and hold jobs, many of them have either sold their land or have it cultivated by the tenants. It has been observed that the number of cultivators has declined in the second generation compared to the first generation among the higher castes, and there is also a concomitant rise in the number of service holders among them.[3]

Though, under the different situation, landowners have sold their land, they continue to be a landowning class. Their land is bought by the people of other classes specially by the cultivating tenants. Thus the ownership of land has been transferred to people of different class and caste groups. But the agricultural labourers have not increased their landholdings and remain in the same position. At present landowners have lost their uniform class characters and have emerged as three types of classes: (a) absentee landlords who live in the cities and have their land cultivated by the tenants; (b) non-cultivating landlords who live in the village, but have their land cultivated by others; and (c) petty landlords who live in the village and cultivate their land themselves. The ex-zamindari areas and the raiyatwari areas in Assam show different pictures regarding the emergence of these agrarian classes. Tables 1 and 2 depict the distribution of agrarian classes in the two districts of Assam — Goalpara, an ex-zamindari area and Sibsagar, raiyatwari area.

From Table 1, it is seen that in Goalpara district, an ex-zamindari area, the growth of agricultural classes is conspicuous due to the abolition of the zamindari system. Here the cultivating owners constitute the largest group, being 34.03 per cent of the households surveyed, and the rent-receivers the smallest group — 5.56 per cent. But

TABLE 1: AGRARIAN CLASSES IN GOALPARA DISTRICT

(figures in brackets percentages of total)

Number of households surveyed	144
Agricultural Classes	
(a) Cultivating owners	49 (34.03)
(b) Cultivating tenants	9 (6.25)
(c) Cultivating owners and tenants	28 (19.44)
(d) Cultivating owners and rent receivers	6 (4.17)
(e) Rent Receivers	8 (5.56)
(f) Agricultural labourers	13 (9.02)
Total	113 (78.47)
Non-Agricultural Classes	
Total	31 (21.53)

TABLE 2: AGRARIAN CLASSES IN SIBSAGAR DISTRICT

(figures in brackets percentages of total)

Number of household surveyed	2,682
Agricultural classes	
(a) Cultivating owners	1,318 (60.40)
(b) Tenants	369 (16.21)
(c) Cultivating owners and tenants	490 (22.46)
(d) Agricultural labourers	5 (0.23)

Source: S C Sarma, 'A Survey of the rural economic conditions in Sibsagar', 1952.

Sibsagar district, a raiyatwari area, shows a different picture where the rent-receivers are totally absent, and the cultivating owners constitute 60.40 per cent of the households surveyed. As the raiyatwari system prevailed all over Assam except in the districts of Goalpara and Cachar, *large land-ownership under* a few persons did not develop. Regarding agricultural labourers it is seen that in Goalpara their number is high (9.02 per cent) but in Sibsagar it is only 0.23 per cent.

Absentee landlords are a type of rentiers who do not enter into any agricultural activities with their tenants. They comprise a class of rentiers and intermediaries between the tillers of the land and the government. The land-ownership rights are with them, hence they deal with the state government. Any dealing by the tenants with the government may lead to the transfer of *their ownership rights to the tenants* As the absentee landowners are gradually increasing in number relations between the landowners and the tenants have been undergoing changes. The same applies to the non-cultivating landlords living in the village. But the petty landowning cultivators, besides themselves cultivating their land, have a part of their land cultivated by sharecroppers. They invest capital for productive purposes and employ their family labour or hired labour for production.

Generally four patterns of relationships emerge as a result of the present functioning of these agrarian groups: (1) between absentee landlords and tenants; (2) between non-absentee but non-cultivating landowners and tenants; (3) between petty landowning cultivators and agricultural labourers and tenants, and (4) between tenants and agricultural labourers. These classes are bound by economic as well as social ties. The tenants as a class may belong to two categories; sometimes a person may have a small amount of land where he is regarded as landowner and at the same time, he cultivates land of other persons for which he is regarded as tenant. In the other case, a person is regarded as a tenant who lives on cultivation of land owned by others. Due to *these reasons* there is a problem of identification of the class of the people.

There are three different systems of payment of land taxes by the tenants to the landlords. (1) the widely prevalent fixed cash-rent system; (2) the system of sharecropping which itself is of two types — 'boka-adhi' and 'guti-adhi'; (In the 'boka-adhi' system land is equally divided between the landlord and the tenant. The tenant cultivates both the *pieces* and the landowner supplies agricultural implements only. Both the parties take the harvest from their respective cultivated land. In the 'guti-adhi' system the tenant cultivates the owner's land and the harvest is equally divided between the two parties.) (3) the system of fixed rent in kind where a tenant gives to his landlord a fixed amount of produce irrespective of the output. This fixed rent is much higher than the rent in cash, but lower than that of the sharecropping.[4]

The landowner only pays the revenue and the other expenses are borne by the tenant. But the Adhiar Protection Act has reduced the landowners share to one *third of the crop on condition of* supplying seeds and draught animals and one fourth of the crop when the same are supplied by the tenant himself. But this regulation is not fully implemented. It has been seen that about 42.43 per cent of the landlords do not give any assistance to the adhiars, and 43.90 per cent of the adhiars do not get any assistance from their landlords.[5] The tenant does not possess any right over the land, and the term of the tenancy and right of enjoyment are very insecure and restricted. The sharecropper's status was previously similar to that of the hired labourer receiving wages in kind. But *The Adhiar Protection and Regulation Act, 1948* has safeguarded the interests of the sharecropper.

Previously tenurial status was transmitted from one generation to another, but the landlords could evict the tenants at any time. But under *The Assam Temporarily Settled Tenancy Act, 1935 and 1971* the tenants' interests have been protected in many respects. At present it is difficult for a landlord to evict the tenant. But in Goalpara and Cachar districts the Act is not yet implemented and in most of the cases, it has been found that the landlords have been evicting the adhiars according to their whims.[6] The big tenants do not always cultivate their land themselves; sometimes they sublet it or have it cultivated by hired labourers. Such a legal provision, therefore, created a system of subtenancy and middlemanship between the zamindars and the real tillers of the soil.

In Assam agricultural labourers as a class are not numerically significant. But their number has been growing. In 1951 they constituted 1.7 per cent of the population; by the time of the Agricultural Labour Enquiry of 1963, they constituted 11 per cent, still a low percentage compared to the all India average of 30.39.

Generally, the agricultural labourers do not own land and subsist on daily wages. in rare cases they possess small strips of land which do not produce enough to live on. In 1950-51, 48.35 per cent of the agricultural labour households were without land, compared to the all India average of 50.07 per cent, while in 1956-57, 63.01 per cent of them were without land, compared to the all India average of 57.18 per cent.[7] Their meagre income from the irregular employment and consequent insecurity of it put them below the subsistence level. All these have resulted into a particular way of life distinct from that of the landowners or the tenants. The common difference between the agricultural labourers and the tenant-cultivators is that unlike the latter, the former do not have any security of employment. However, the agricultural labourers in Assam are economically better off than those of the other parts of India. In Assam they annually get employment on an average for 208 days, whereas at the all-India level they get it only for 189 days. However, they have to seek some employment in the non-agricultural sector, especially during the lean agricultural season. Hence it is difficult to identify the agricultural labourers as a concrete class.

Almost everyday the agricultural labourers have to seek new employment from the landowners or the tenant-cultivators. They only supply their labour in the agricultural operations and do not invest any capital; whereas the employers provide them with agricultural implements, seeds, manure, etc. Their payment is made very irregularly. The labourers who use their own ploughs and buffaloes get slightly higher wages than those who do not.

Today relations among the agrarian classes have changed to a great extent. It is, perhaps, due to the impact of various agrarian reforms and partly due to the new market situation. Now relations between the landowners and the labourers are formal, contractual and impersonal in nature, and social distance between them is very great. Though in the past this social distance was not

[illegible]
bound by some [illegible] ligation, rights and duties. The interdependence among the classes in the economic and social affairs was more than what it is today. This was probably further strengthened by the functional division of caste, the spirit of paternalism and extension of kinship obligation. However, besides these economic relationships, there are socio-cultural relationships among the classes which have not been touched upon here.

Pre-British Assamese society had a class structure of feudal character where kings were at the top and the common people were at the bottom of the hierarchy. In between these two groups there were hierarchies of the nobles. British rule and British land policy created a class of landed interests and intermediaries between the cultivators and the landlords. The organic character of agriculture was also changed to a large extent as a result of these new land relations, and hence non-communitarian, contractual and impersonal relations emerged. British [illegible] ideas of the landlords along with impersonality and contractuality. However, the post-independence land reform measures have not brought about the expected changes in the agrarian social structure; instead, these have created more inequalities among them.

Agricultural Holdings Tax: A Modified Scheme

A Comment

D Bandyopadhyay

LAND REVENUE is the oldest form of state impost on the citizens. Though notionally it is linked to general productivity and/or benefit potential of land, this impost is not directly related to either gross or net product of land or quantified benefits accruing therefrom. It is an impost on the ownership of land *per se*. In view of this, it is a bit surprising to find in Amaresh Bagchi's paper (*EPW*, September 23, 1978) that he suggested shifting of the incidence of the agricultural holdings tax under his modified scheme to the sharecroppers. Perhaps, his suggestion has been made out of a misunderstanding of the nature of the basic character of the agricultural holdings tax and the relationship between the sharecropper (bargadar in West Bengal) and the landowner.

Agricultural Holdings Tax, as will be amply clear from Bagchi's paper, is basically a land revenue. The modified scheme of the tax is intended only to rationalise the basis of the levy and assessment of land revenue in the light of changes in the agrarian economy. The land revenue system as it prevails or prevailed in most of the states was the outcome of a long historical process. Many anomalies and irrationalities crept into it over time. As for example, in West Bengal the rate of rent that was prevalent in 1937 was accepted as land revenue from the raiyats after the zamindary system was abolished. Under the zamindary system, the rate of rent varied from plot to plot having similar advantage and facility depending upon the relationship between the raiyat and his superior intermediary and various other extraneous economic and non-economic factors. As a result, for the same type of land there was wide variation in the rates of revenue. This obviously called for a rationalisation of the system of revenue broadly related to notional productivity/benefit potential of the land belonging to any landowner. So, any scheme of agricultural holdings tax is basically a scheme of rationalised land revenue payable by the owner for the use and occupation of the land under the state, as distinct from any other tax based on income or individual paying capacity.

Since a modified agricultural holdings tax is basically a revenue on land holding, there is neither any scope nor any [illegible] need for making any distinction for the purpose of levy of revenue between a self-cultivated land and a land which is being cultivated by a sharecropper (bargadar). The decision to get his own plot of land cultivated by a bargadar is a conscious economic choice of the landowner who might as well have cultivated it with his own labour or through hired labour. A landowner is under no compulsion, legal or otherwise, for having his land tilled by bargadars. He does so entirely on the grounds of relative advantage. Hence, in a tax scheme based on ownership of land such a distinction is totally irrelevant and cannot be the basis of any reasonable classification in the context of Article 14 of the Constitution.

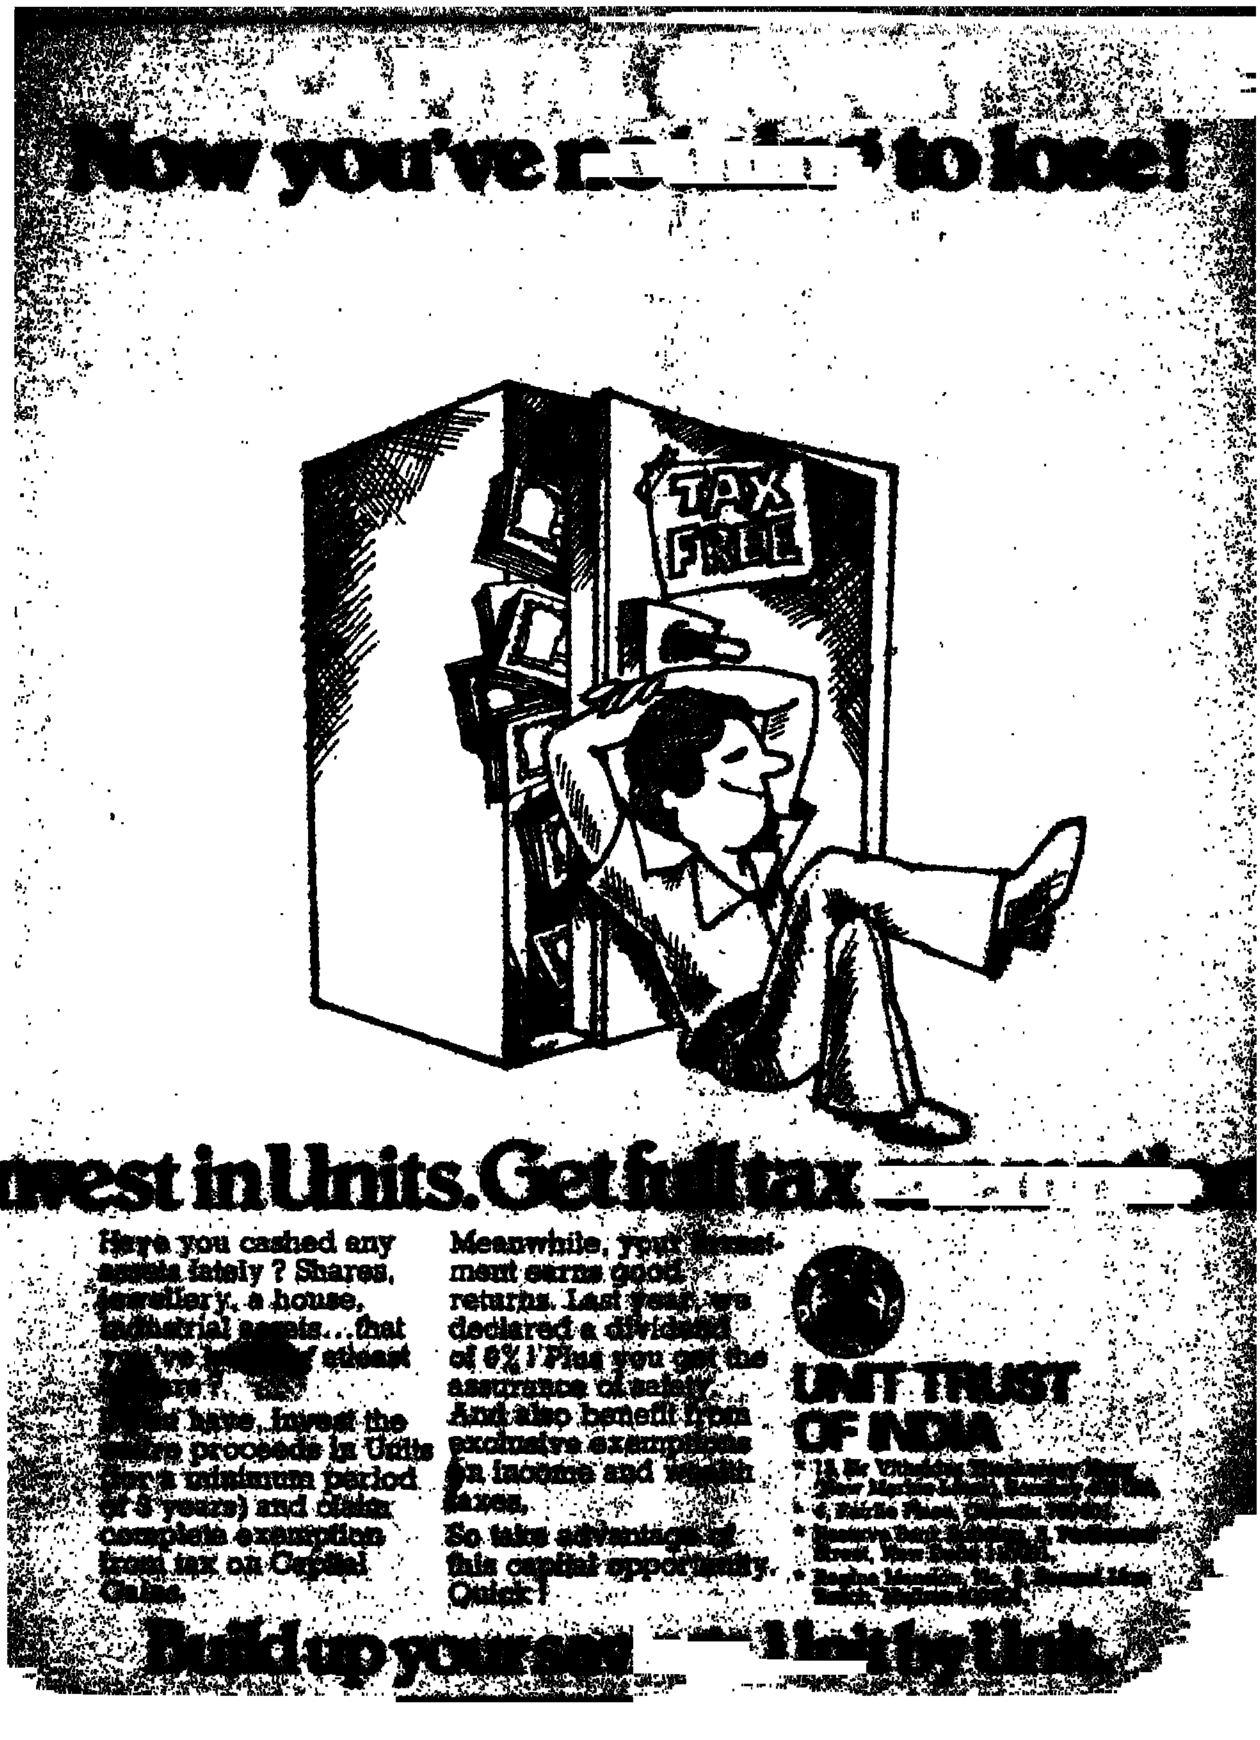
Further, the misunderstanding arises because of the confusion about the status of tenant and bargadar. Under the West Bengal land system, a land owner who keeps the land in his khas possession may induct bargadar for cultivating his land on the basis of share of produce. Induction of bargadar does not affect the ownership right at all. No tenancy right accrues to the bargadar and the land could be resumed by the landowner for self-cultivation under certain specified circumstances. Therefore, the circumstance of a landowner who cultivates the land himself or gets the land cultivated through a bargadar, is not so radically different as to justify or to call for the kind of distinction which Bagchi has in mind.

Moreover, if Bagchi's suggestions were given effect to, landowners who are having their lands cultivated by bargadars and thereby getting risk-free unearned rent income would be treated more advantageously than the landowners who cultivate the land themselves or through hired labour with all the attending risks and costs. The effect would be the same if any tax scheme provided relief to the owners of barga land. This would be contrary to the whole concept of progressive taxation. And in fact such a scheme would as well be described as a regressive and retrograde measure.

It is also relevant to point out in this connection that even in the existing system there is an element of progression in land revenue in West Bengal as well as in several other states based on size of ownership holding. The present system does not provide for any distinction between self-cultivated land and land tilled by bargadars so far as levy and assessment of land revenue is concerned. If this position has been universally accepted as fair and equitable it is difficult to see why the rationalised system of land revenue,

which the AHT essentially is, should be opened to challenge merely on this ground. On the other hand, the landowners always insist on getting the receipt for revenue payment as evidence of their possession and title over their own land and they would not certainly like to legally shift a part of the new land revenue to their share-croppers thereby introducing a risk element in their claim of continued possession and title.

In this context, it is, perhaps, germane to point out that the exising land revenue covers not only agricultural but also non-agricultural land. How a landowner uses his land is again basically his conscious economic choice. The law on the subject, particularly in West Bengal, gives the landowner almost absolute freedom in the matter of use of land owned by him. The nomenclature of the new revenue system as agricultural holdings tax might give rise to the misconception that the new impost would apply only to lands which are being used exclusively for agricultural purposes. In West Bengal, almost all lands are capable of producing agricultural crop. But the landowners do not utilise all these lands exclusively for agricultural purposes. Therefore, the term 'agricultural holdings tax' should not be misconstrued as a tax or impost only on land used for agricultural purposes. In West Bengal, particularly, there are extensive areas of land on the fringes of metropolitan agglomerations and the developing industrial complexes which are put profitably to various non-agricultural uses. A case in point is the 'bheries' (fisheries) near Calcutta which supply the bulk of fish to the metropolitan market. These 'bheries' (vast water areas spread over hundreds of acres) were created by inundating agricultural lands and not infrequently by means not quite fair. They yield very high income. These lands on which land revenue is assessed currently would get excluded unless the scheme provides for bringing such lands within the land tax net. Therefore, while suggesting a scheme for rationalisation of land revenue, one has to bear in mind the need to update and rationalise the rateable value of such lands which are put to profitable uses other than agricultural purposes. Perhaps, a change in the nomenclature would be desirable. Instead of calling the new scheme 'agricultural holdings tax' it could be called 'farm holding revenue' or 'land holding revenue'. This would remove any scope or possibility of misunderstanding about the true import and coverage of the new scheme of land taxation.



Reply

Amaresh Bagchi

THE points made in Bandyopadhyay's note about the modified AHT scheme are basically twofold, *viz* (i) that in a scheme of holdings tax based on *ownership* of land it is unnecessary and undesirable to make any distinction between self-cultivated land and land given to a share-cropper (bargadar), and (ii) that there should be some arrangement for bringing into the tax fold lands under non-agricultural uses like fishery and poultry.

The suggestion made in the modified scheme of agricultural holdings tax put forward by me for permitting landowners to pass on an "appropriate part" of their AHT liability to the tenants where the land is let out, was based primarily on the consideration that if the canon of equality as enshrined in Article 14 of the Constitution is not to be violated, a reasonable classification is needed as between taxpayers in dissimilar circumstances since equal treatment of unequals might give rise to complaints of inequity. If it can be argued — as Bandyopadhyay has done with considerable force — that the circumstance of a landowner who gets his land cultivated by a bargadar cannot be regarded as materially different from that of one who chooses to cultivate his land himself or by hiring labour, since basically giving land to a bargadar involves an economic choice, there is no need for making any special provision for barga land in the proposed tax scheme under a bargadar. The fact that the AHT is essentially a land tax like land revenue and that land revenue despite the superimposition of surcharges thereon has come to be accepted as equitable, lands support to Bandyopadhyay's contention. A tax scheme based only on ownership also has the merit of simplicity as it avoids the complications of inquiries into the tenancy status of the land in question. It was only by way of abundant caution that the suggestion was made for putting a provision in the land to permit owners of 'barga' land to shift an "appropriate part" of the tax and it may be pointed out that the appropriate part contemplated in this context is the tax that would work out if the Rateable Val[illegible] tion was taxed at the lowest rate (next to zero) prescribed in the tax schedule. Such a provision might help to remove all scope for challenge to the tax scheme on grounds of lack of reasonable classification. A provision like this, I felt, would detract less from the progressivity of the tax scheme than alternative arrangements like exclusion of a portion of land under a sharecropper as has been provided for in the West Bengal Land (Farm-Holding) Revenue Bill, 1978. However, in the interests of simplicity and also in view of the facts mentioned by Bandyopadhyay, namely that a bargadar is not exactly a tenant under the law, and that the present land revenue system which is based on ownership holding is widely accepted as equitable despite an element of progressivity built into it in several states it would appear that a purely ownership basis for the AHT is preferable. Any attempt to allow for the bargadar's share in the tax in determining the liability of the owner or to frame the tax on occupational holding basis as was suggested by the Raj Committee would obviously give rise to serious administrative problems and also create a gap in the tax scheme.

As for the assessment of lands put to non-agricultural use, the need for devising some way of bringing such lands too within the fold of land taxation cannot be denied. I did not go into this question as the focus of the AHT is on rationalisation of taxation of agricultural lands. Since, however, it would not be easy to treat lands used for non-agricultural holdings on a homogeneous basis in the same manner as suggested for agricultural lands situated within a given area or block one has to think of some way of assessing the tax for such lands which would reflect the economic potential of the land while avoiding assessment of the actual return derived from each holding individually. One way of doing so would be to go by the *value* of the land in each area and take a fraction of the capital value as the rateable value of the land in question for purposes of the holdings tax. However, in the case of assessment of such lands the scope of appellate review has perhaps to be a little wider than in the case of assessment of agricultural lands where, for reasons set out in my paper of September 23, 1978, the right of appeal may be restricted only to a review of the classification of individual holdings so that this RVL of a given area would not be open to challenge by individual taxpayers.

Now you've
to lose!

ACC meets this need constructively through rehabilitating old factories, updating machinery, converting cement plants from the wet to the dry process, utilising 'waste' products as raw materials for cement manufacture. These measures, coupled with the Japanese pre-calcinator technology—which ACC is introducing in its existing plants at Wadi, Chanda, Jamul and in the new factory under way at Gagal, Himachal Pradesh—will increase the company's cement capacity by a little over 2 million tonnes by 1981-82.

Deceptive Stability

THE index numbers of wholesale prices for December 1978, released this week, do at first appear to bear out the government's claim that prices have been stable. The index for all commodities for December 1978 stood at 184.8 (base 1970-71=100) and in fact showed a slight fall of 0.4 per cent over December 1977. The overall position is not substantially altered even if, instead of a point-to-point comparison, the average of the monthly index numbers for 1978 is compared with that for 1977. A closer look at the index numbers, however, brings out some significant, and not altogether reassuring, aspects of the price situation.

For the 'primary articles' group as a whole, the index number for December 1978 showed a fall of 2.8 per cent over December 1977. Taking some specific items within the group, there was a decline of 4.1 per cent *for cereals, 14.2 per cent for oilseeds and 7.1* [illegible] for fibres (mainly cotton and jute). In what light, however, are [illegible] to be seen?

To take cereals, the problem facing th[illegible]overnment [illegible] recent years has been actually one of providing price s[illegible]t to [illegible] of late, this has been true also of other crops like sug[illegible]e [illegible] cotto[illegible] The government's extensive procurement operations in [illegible] have be[illegible]med at preventing prices from falling below the so-ca[illegible] prices which are now really support prices. Experience in d[illegible] of the country has shown that these operations benefit mainly the big farmers both because they have the largest surpluses to sell and because, for one reason or the other, the government purchase agents do not manage to reach the smaller farmers in the villages. The succession of good harvests is only superficially responsible for necessitating government intervention to prop up foodgrain prices; basically this situation has arisen because of the lack of incomes and purchasing power in the hands of a very large proportion of the population. At the same time, through its public distribution system, the government has tried to keep down consumer prices of cereals, especially in the metropolitan cities and the larger towns. The simultaneous pursuit of these two objectives of price support for the larger farmer and controlled prices for the urban population has not been without a heavy cost. The subsidy on the government's cereals procurement and distribution operations was Rs 506 crores in 1976-77 and Rs 479 crores in 1977-78 and has been estimated at Rs 456 crores in the Budget for 1978-79, making a total of about Rs 1,450 crores in the three years.

Oilseeds, the wholesale price index for which was 14.2 per cent lower in December 1978 compared to December 1977, are another case where the government's seeming achievement on the price front has been expensively purchased, in this instance in terms of outlay of foreign exchange. No less than Rs 652 crores in foreign exchange were spent on importing edible oils in 1977-78. Similarly, the import of nearly Rs 400 crores worth of cotton and cotton substitutes in 1977-78 significantly influenced domestic prices of cotton.

All in all, therefore, the so-called price stability in respect of the 'primary articles' group must necessarily evoke very mixed reactions. In respect of cereals, it reflects the poverty of the people and the failure to generate employment and incomes among the poor. In regard to oilseeds (and edible oils) and also cereals what has been most notable is the government's anxiety to keep down prices for the benefit largely of the middle and upper classes, which objective has been achieved only at a heavy cost — in terms of outlay of foreign exchange in the case of oilseeds and cotton and erosion of the government's budgetary revenues in the case of cereals.

In respect of the 'manufactured products' group also, the overall picture presented by the index numbers of wholesale prices is misleading. For the group as a whole, the index for December 1978 was only 0.4 per cent higher than for December 1977. But this apparently satisfactory situation was entirely attributable to a 14.1 per cent decline in the index for the 'food products' sub-group which, in turn, was largely *the result of decline* in prices of sugar, khandsari and gur, edible oils and oilcakes. Virtually every other sub-group of manufactured products showed a substantial rise in prices. The index for paper and paper products was higher by 6.8 per cent, leather and leather products by 19.2 per cent, rubber and rubber products by 20.4 per cent, basic industrial chemicals by 11.5 per cent, non-metallic mineral products by 13.4 per cent, basic metals and alloys by 12.7 per cent and machinery and transport equipment by 5.1 per cent. Clearly, industrial

prices have been under strong upward pressure.

This raises a number of issues. First, in industries using agricultural raw materials, invariably there appears to have been a widening of the gap between raw material prices and prices of the finished industrial product. For instance, the benefits of the large import of cotton and cotton substitutes in terms of lower raw material costs for the textile industry have not gone to the consumer but have been appropriated by the industry.

Second, the claim, repeatedly advanced by the government and the Reserve Bank, that despite substantial expansion of bank credit and money supply, prices have not gone up is shown up to have no basis, if a sectoral instead of an aggregative view is taken of price movements. As seen above, industrial prices have gone up quite sharply virtually all along the line, and any assessment of the expansion of bank credit to industry must take this material fact into account

Third, the rise in industrial prices has had its impact on costs of living, even to the extent of completely neutralising the effect of the decline in prices of cereals, edible oils and sugar. The all-India average consumer price index number for industrial workers (1960=100) rose from 315 in September 1977 to 327 in September 1978 (on a twelve-monthly moving average basis). The consumer price index number for urban-manual employees (base 1960=100), on a monthly average basis, was 300 in the first seven months of 1978 compared to 292 in the whole of 1977.

Finally, the quite substantial and sustained rise in prices of cement, basic metals and industrial machinery cannot but have also raised the money costs of investment. Hence despite the overall 'price stability', real investment has lagged behind investment in money terms. *This is a sombre thought since even in money terms the level of investment in the public and private sectors is now acknowledged to have been poor.*

Congress Party

Brewing Tensions

WHILE Congress leaders continue to debate on the 'modalities' of 'merger' or 'unity' of factions of the party most of which are distinguishable only in the varying degrees of their subservience to Indira Gandhi, trouble seems to be brewing within the Congress (I) itself. In Karnataka and Andhra Pradesh the opposition to Chenna Reddy and Devaraj Urs has come from elements who hope, by their display of greater servility to Indira Gandhi, to replace them. Apparently, when Indira Gandhi was expelled from Parliament, the organised violence in Karnataka in the urban areas did not have the sanction of the Chief Minister (who was actually away from the state then) but was the handiwork of potential supplanters of Devaraj Urs. Similarly, the 're-entry' of Vengala Rao into Andhra Pradesh politics, and the very visible independent confabulations he has been carrying on with Indira Gandhi should have not in the least "amused" Chenna Reddy who, while actually claiming that he is "amused" at these goings-on, has promptly dissolved the old Congress (I) executive in the state and has formed a new one packed with his supporters. In Uttar Pradesh, the present leadership is under fire because it did not sufficiently exert itself and fill the jails following the expulsion of Indira Gandhi from Parliament; and in Maharashtra, so loyal an adherent to the cause as Nasikrao Tirpude is on the mat, again because he was not sufficiently indignant about his leader's expulsion from Parliament. In most of these cases, behind the differences apparently arising out of a competition in servility towards the party's supreme leader lie more material concerns — like in the efforts of one or other of the traditionally dominant castes in each of these states to replace the present leaderships.

These dissident activities in the Congress (I) might not be unduly worrying those leaders in the states where the party is not a ruling party; but the leaders of the party in Karnataka and Andhra Pradesh should have cause to worry. This perhaps explains such curious developments in recent days as the parallel wooing of dissident elements within the Janata party by the national leadership and the state leaderships of the Congress (I). With the re-induction of Charan Singh and most of his followers, the open wooing of Charan Singh himself has necessarily to discontinue; but it has not prevented Devaraj Urs from showering encomiums on Raj Narain for his crusade against the RSS, nor has it prevented C M Stephen from taking exception to the action of the Karnataka Chief Minister in securing the suspension of virtually the whole of the Opposition in the Karnataka assembly.

Bonded Labour

Island in an Ocean of Bondage

Our Bihar Correspondent writes:

IT is well over three years since the the bonded labourers of Gopalpur, 25 km west of Patna, began their struggle for debt redemption and higher wages (see "Not Out of Bondage", EPW, September 10, 1977). The struggle still continues, despite efforts, ranging from inducement to compromise to use of terror, to quell it.

Much has changed in the village meanwhile. The bonded labourers have become free workers. Their wages have gone up from 1.5 seers of foodgrains (valued at one to two rupees) to Rs 5 per day. Prolonged struggle has given *the people the courage to tell the truth to the face of the landlords, policemen* and government officials. On one occasion, about two months ago, they even came out with their traditional weapons to face the gun-wielding landlords — in the presence of the police. The landlords have tried to get the labourers bogged down in court cases. In the last three years, over 30 cases have been filed by the landlords, labourers and the police in the Danapur sub-divisional court. About 60 labourers in all have been implicated in these cases, Nagina Mistry, the workers' leader, has himself been involved in 12 cases. In cases filed by police under sections 107 and 113 of the IPC, both the parties have to produce bonds of Rs 10,000 to Rs 15,000, something which only the landlords can do. In the incident referred to above, after the labourers had faced the landlords armed with guns, the police arrested three persons each from the two sides. While the arrested landlords were released the next day, the labourers, unable to produce bonds of the requisite amounts, had to remain in the Danapur jail for 25 days before they were freed. The legal institutions are being manipulated by the landlords in many other ways as well. Twentytwo bonded labourers won their cases in the Danapur sub-divisional court for payment of wage arrears, amounting to several thousand rupees, but the landlords have challenged the sub-divisional court's orders in the Patna High Court, where the cases are still pending.

There has been a change of leadership of the labourers. Deonarain Ram, who had led the labourers in the first phase of their struggle, is now living "in exile". The labourers have thrown him out and virtually banned his entry into the village. Simple and truthful,

the labourers would not tolerate a leader who, they alleged, swindled the subscriptions raised for the struggle (for court and laywers' fees, bus fares to and from towns, etc) and finally, lured by handsome bribes, turned an 'agent' of the landlords. Wall slogans appeared in the harijan basti: 'dalal Deonarain se sawdhan!' (beware of agent Deonarain!). The leadership of the workers has now passed into the hands of Nagina Mistry, a mason, and Kesari Ram, a scheduled caste middle-schools teacher.

A significant development is the assumption of the political leadership of the Gopalpur struggle by one of the CPI(ML) groups. It may be that the activists of this group, like those of other Left parties, are dissipating all their energies in patient litigation, but they are also trying to inject ideology into the Gopalpur struggle. Aslo, some activists of the Bihar Students' Association are making efforts to raise the political consciousness of the labourers by associating themselves with the struggle. This change, as manifested in the posters put up in the village and in joint student-labourer demonstrations, in Patna, has put the police camp in Gopalpur "on the alert". Today every visitor in shirts and trousers to the village is carefully interrogated by the magistrate and policemen there. "A report has to be sent to the headquarters, you know" we were told by the magistrate. There was no such interrogation when we had first visited the village at the peak of the Emergency.

The labourers' struggle in Gopalpur has ushered in many changes but it also faces quite a few institutional hurdles. Though the bonded labourers of Gopalpur have become free workers, the system of bonded labour has not been rooted out. In the villages in the neighbourhood, bonded labour continues. Even in Gopalpur, the landlords have brought in bonded labourers from nearby villages. The freedom won by Gopalpur's labourers is, therefore, like an island in an ocean of bondage. Apart from the bonded labour system, what has not yet been undermined by the struggle is the caste solidarity of the landowners. Gopalpur has a population of 2,000. Fifty per cent of the people are middle caste Kurmi landowners and the rest labourers and poor peasants belonging to scheduled castes and other lower castes, like Tatwas, Kahars and Saos. There is political integration among the harijans and other lower castes. On the other hand, barring a few exceptions, the Kurmis, big and small, are united against the labourers. The three years of struggle and the repeated attempts to build up a broad anti-feudal peasant unity have failed to demolish the caste organisation of the landlords, despite the predominantly economic character of the conflict. Recently, the big landlords have convened a series of caste meetings to emphasise that "all this is nothing but a fight between Kurmis and harijans".

Pondicherry

A Calculated Move ?

IT is no use for the Prime Minister to try to explain away his remarks on Pondicherry during his Madras press conference on January 19 as merely his "personal views", and it is even more disingenuous for him to pretend to be "surprised" at the reaction in Pondicherry to his remarks. Admittedly, the political situation in Pondicherry has been vexing almost beyond imagination since the moment the results of the elections were announced in June 1977, and the rivalries between the chief minister and his home minister went on unabated during all the months of the existence of the ministry. These rivalries were only superficially related to the failure of the AIADMK which obtained the largest number of seats in the June 1977 elections to obtain a clear majority of the total number of seats in the legislature. At a deeper level, the rivalries were related to developments in Tamil Nadu whose shadow falls heavily on Pondicherry. Then, there were the many local factors which all came to the fore during the life of the AIADMK government, what with the Chief Minister unable to ever expand his ministry from the original number of two (himself and his Home Minister), but nevertheless managing to find further contentious issues like the distribution of the total of 22 portfolios between the two of them.

But granting all this it was extremely imprudent on the part of Morarji Desai to be at his schoolmasterish worst during his press conference and peremptorarily announce that the Union territory would be merged with the contiguous states of Tamil Nadu, Kerala and Andhra Pradesh, and further threaten to enforce the decision, notwithstanding any popular opposition to it, and suppress the opposition to such a move as well. It was clearly the Morarji Desai of the days of unilingual Bombay state speaking — an attitude of mind which then cost hundreds of lives.

Any yet, it would be wrong to dismiss the words of Morarji Desai as mere ravings of a self-opinionated man. At a more obvious level, neither the Prime Minister nor the Chief Minister of Tamil Nadu have been happy about the reluctance of the Pondicherry administration to modify in any signific manner their stand on prohibition. It was only recently — and with the most extreme reluctance — that a programme of 'dry days' was introduced by the Pondicherry administration; and the suggestion that there should also be a very wide 'dry belt' between the Union territory and Tamil Nadu is unlikely to be accepted by the Pondicherrians even during the period of the present direct rule by the Centre. The only sure way of further extending the 'dry belt' in Pondicherry was to merge it with Tamil Nadu whose Chief Minister, for all his political differences with the Centre, is one with the Prime Minister in his passion to prevent other people from drinking.

Secondly, and more importantly, it is no secret that while Kerala and Andhra Pradesh have not exactly been avid to incorporate into their territories the enclaves of Mahe and Yenam, Tamil Nadu has merely suffered the existence of Pondicherry and Karaikkal as separate units. Considering the fact that the Prime Minister needs all the support he can get in Parliament, could it be that he tried to make a deal with the AIADMK on Pondicherry, in return for some modification of the latter's stand on the Morarji Desai government at the Centre? It is true that Charan Singh has returned to the Cabinet and the Desai government faces no immediate danger. But given the circumstance of the 'great reconciliation', it is only being realistic not to lay high hope on the continued viability of the present arrangement at the Centre; and if one were to go by the development

Annual Number 1979

The 1979 Annual Number will be published in the third week of February. It will be priced Rs 10 per copy, but will be supplied free to subscribers. In view of the Annual Number, the next weekly issue will be that of March 3.

in Uttar Pradesh — and the threatened developments in Bihar and other Janata ruled states — the knives might be out even before they have been properly sheathed. Part of the consequences of such wheeling and dealing has been the killing of two persons, heavy damage to public property, and Morarji Desai himself being forced to express, though quite unconvincingly, his "surprise" at the sharp reaction to his statement. But such facts would of course not unduly trouble one who claims that he is at peace with himself and his Maker.

The Press

Not in Public Interest?

A Correspondent writes:

BENNETT, COLEMAN AND CO is the largest newspaper publishing company in India with an annual gross revenue approximating the annual revenues of states like Meghalaya, Sikkim and Tripura, give or take a few crores. It publishes such well known dailies as *Times of India*, *Economic Times*, *Maharashtra Times* and *Navbharat Times* and money-spinners like *Illustrated Weekly of India*, *Dharmayug* (Hindi weekly) and *Filmfare* (film fortnightly). There are a number of other publications in the Bennett, Coleman stables. Not all of them are financial successes and in fact the need to nurse the loss-making publications has been advanced as the justification by Bennett, Coleman for raising the advertisement tariffs of *Times of India* more than once in the last few months. Bennett, Coleman is controlled by Ashok Jain, whose interests stretch well beyond newspapers to jute, cement, etc. But Bennett, Coleman is perhaps the only goose that has continued to lay golden eggs for him. So when the newspaper company recently announced in the public notices columns of *Times of India* that it proposes to amend its memorandum of association to enable it to "diversify its activities, particularly in the field of manufacture of cement, chemicals, fertiliser, synthetic fibre, etc" it was news indeed. Especially so since it appeared in the wake of a news report that a move was afoot to merge certain loss-making companies of the Jain group with Bennett, Coleman.

The proposed amendment enabling diversification is also interesting for another reason. Hitherto Bennett, Coleman had rested content with investment of a part of its surplus in shares of companies in the Jain group, including some loss-making companies. Now, along with diversification, it is proposed, according to the notice, to delete the words "not immediately required" from the company's memorandum, so that the amended clause reads "to invest and deal with moneys of the company upon such securities and in such manner as may from time to time be determined". The deletion would remove the constraint on investment stemming from the current requirement that investment should be made with moneys not immediately required, that is, from out of surplus.

The proposed amendment to the articles of association is an enabling measure and it does not necessarily follow that the company would indeed diversify or that, in the process, it would take over companies like New Central Jute, Rohtas Industries, Ashoka Cement or Sone Valley. Besides, the government has in its wisdom under section 72A of the Indian Income Tax Act extended tax benefits to viable units in case they absorb sick units. Even if the enabling measure is translated into practice, diversification might be considered to be within the framework of the law in a narrow sense. An idea of the losses of some of the Jain companies have incurred may be had from the accompanying Table.

Table

(Rs lakhs)

Company	Year Ended	Profit or Loss*	Unprovided Depreciation
New Central Jute	March 1978	— 158	31
	March 1977	— 137	—
	March 1976	+ 91	—
Rohtas Industries	March 1978	— 164	107
	March 1977	— 211	—
	March 1976	— 71	72
Ashok Cement**	March 1978	— 105	27
	March 1977	— 106	58
	March 1976	— 94	46

* Without adjusting for accumulated loss.

** Cement unit of company was taken over by Rohtas in July 1977; compensation awarded by arbitrator Rs 250 lakhs.

Legality or the lack of it is, however, not the point at issue even if the various departments of the government concerned with the amendments to the memorandum of articles of association, eventual diversification of the newspaper company and/or merger of sick units with Bennett, Coleman might make it out to be so. The real issue is whether a newspaper company should be enabled to divert funds away from the newspaper business in which the funds are generated. The Press Commission of the fifties did not unfortunately concern itself specifically with this question. The Commission did express a certain disquiet over the fact that bussiness groups from jute or other industries had made forays into newspaper business. There was concern over the fact that other business interests weighed heavily on the editorial policies of newspapers. Beyond that the Press Commission interested itself with separation of accounts of different newspapers belonging to a chain. Pooling of accounts was frowned upon by the Commission, though in a context different from that arising from merger of different businesses.

It is the Fact Finding Committee on Newspaper Economics which, in its report of January 1975, after noting *inter alia* the attempt by a major newspaper company to takeover a steel company, stated that the main economic advantage of delinking of newspaper interests from other business "will be that newspaper profits would not be capable of being easily used for purposes other than operating newspapers". There have been a number of cases, the report pointed out, of close connections between non-newspaper business and the business of running newspapers. Newspaper profits have been used for acquiring shares in industrial enterprises. Deposits attracted from the public in the name of newspapers have been used for a variety of purposes, sometimes creating difficulties in meeting the repayment obligations. Another material fact is that newspapers are subsidised by the government in a number of ways, on the ground that they are a public service. Thus the news services of the news agencies are made available at rates which do not cover costs. Newspapers also benefit from specially low postal and telegraph rates. Obviously, such subsidisation makes an important contribution to the profits of newspaper companies. Diversion of these profits to other businesses would tantamount to misuse of the subsidies extended to newspapers. As the Committee on Newspaper Economics had emphasised, "if newspapers are

[illegible] essential that profits earned from newspapers should be ploughed back into the newspaper enterprises itself". The committee had, therefore, recommended that pending the adoption and implementation of the requisite legal measures, it would be desirable "to take steps for checking the use of newspaper profits for non-newspaper purposes".

Should not then the entire issue be referred by the government to the new Press Commission? Pending its recommendations, would it not be desirable in the public interest to take preemptive measures against diversification of newspaper companies into cement, chemicals, fertiliser, synthetic fibre, etc?

Religion

Wrong Kind of Politics

ON Sunday, January 28, Pope John Paul II addressed the conference of Cardinals and Bishops of Latin America in Mexico City. In the days of Pope John XXIII and his encyclical, many thought that attempts were afoot to subvert the Church and even infiltrate Reds into it. But Pope John Paul II, himself a native of Poland, has clearly put a stop to all such outlandish notions by his call to the Cardinals and Bishops of Latin America to sternly eschew 'politics'. He was not merely indulging in generalities; in a meeting with hundreds of Mexican priests and members of religious orders after his formal inaugural address; he was much more specific. He asked the clergy to keep out of political and social activities, a growing tendency in Latin America for the past decade. The clergy, according to Pope John Paul, "should not give in to social-political radicalisms which in the long run become inopportune and counter-productive You are spiritual guides who try to orient and improve the hearts of the faithful. You are priests ... you are not social leaders, political leaders or employees of temporal power. Do not forget that temporal leadership can easily become a source of division while the priest must be a sign and a factor of unity, of brotherhood".

Since the Roman Catholic Church itself has ever eschewed 'politics', what Pope John Paul II is disapproving of is only one kind of 'politics' — the political involvement of the so-called 'dissident' clergymen in many Latin American countries. The dissident clergymen, belonging for the most part to middle and lower levels of the [illegible] and being in the most close contact with the actual reality of existence in Latin America for the overwhelming majority of its people, could not but be active in their opposition to the many authoritarian regimes of the region. These were sometimes merely an embarrassment to the established clergy, sometimes were more actively involved in organising and mobilising popular struggles, and on occasion, as in the case of Camilo Torres, were joining the armed guerilla struggle "because there could be no other solution", and dying fighting.

It is, however, Francisco Pizarro and Hernando Cortez, rather than Camilo Torres who have been the true representatives of the Roman Catholic Church in Latin America. Hence it is perfectly 'christian' for Pope John Paul II to admonish the dissident priests and urge them not to give in to "social-political radicalism" while remaining silent about the denial of basic freedoms in many Latin American countries.

Iraq

Distress Signals

A RECENT report in the CPI's central organ, *New Age* (January 21) has spoken rather plaintively of the intense persecution the Iraqi Communist Party (ICP) has been subjected to by the ruling Baath Party in Iraq, when the ICP is "formally part of the coalition within the Progressive Patriotic National Front". The persecution and killing of communists in Iraq are no recent matter, for the *New Age* report itself speaks of more than 30 executions and five deaths under torture of communists during "last year". Moreover, throughout last year when these killings were going on — there were reports of such killings towards the end of May last year when the secretary-general of the Progressive Patriotic National Front announced that 21 communists had been executed; in June when seven more executions were reported; and in August when 17 more such executions, this time of 11 soldiers and six civilians unlike in May and June when all those sentenced to death were soldiers, were reported — there was not a ripple in *New Age*, presumably because the ICP had not yet acknowledged what it has now apparently done — that its partnership in the ruling Progressive Patriotic National Front is "in fact ... just a fiction".

However, the persecution of Communists in Iraq, on the realisation by the ICP that its being formally part of a coalition with the Progressive Patriotic National Front there is "in fact ... just a fiction" does not seem to have led to any basic reassessment of the line of building national democratic alliances with bourgeois parties in the underdeveloped countries and newly *liberated colonies — a line which* the ICP, the CPI and various other communist parties in the regions are finding it increasingly difficult to implement. There is now hardly any Communist Party in the newly liberated areas of the underdeveloped world which has not been virtually ruined in pursuit of this thoroughly bankrupt line. Nevertheless the *New Age* report speaks of how the ICP, with the obvious intention of seeking approval and understanding of its bourgeois partner, "made considerable concessions and gave up many of its demands in the interest of national unity. For instance, it suspended its mass organisations among youth, students and women because the Baathist rulers had insisted on this as a condition for the formation of the United Front". After making this confession of rank opportunism and surrender — in return for which the Baathists let loose their compaign of killings and terror, repression and torture upon the communists — the ICP is apparently even now "striving to stop deterioration in the relations with the ruling Baath Party, and not only to preserve the co-operation of the two parties but to develop and deepen it still further". The reason for all hope not being still lost is that, there are, as the *New Age* report very kindly goes on to identify, "right-wing forces of the Baathist Party" which are being used by "reactionary Arab forces and by the zionists and imperialists to destroy the coalition and patriotic unity and to turn Iraq into the way shown by Sadat of Egypt". Further, "these forces in the Baathist Party are not only anti-communist they are also anti-Soviet. They are against the Palestine Liberation Organisation and they want to influence Syria away from friendship with the Soviet Union and to capture the Baathist ruling party in Syria".

It was not so long ago that the Baath'st Party in Syria was being accused precisely of following such 'rightist' policies and of wanting to subvert the 'progressive' Baathist regime in Iraq. Now one has presumably to wait for the Syrian regime to resume murdering communists in Syria for fresh distress signals to be hoisted.

Industrial Sickness and Management Policy

THE article "Sickness in Industry: A Case Study of Deliberate Management Policy" by Jayati Ghosh (*EPW*, January 13) was interesting reading. I have the following comments to make regarding the data furnished and other statements made therein:

(1) It appears from Table 2 (Raw Material Costs) that total expenditure on materials ranged from 7.2 per cent in 1966-67 to 15.2 per cent in 1967-68. For most of the years it has been steady at about 11 per cent. This is rather surprising as the Selected Characteristics by Industry Groups furnished in the Annual Survey of Industries 1975-76 published by the Central Statistical Organisation indicates a widely different ratio between raw material costs and total inputs in respect of the industries falling under the group of industries (industry code 323) covering the case under study:

	(Rs Lakhs)
Total emoluments	789
Fuels consumed	783
Materials consumed	1243
Products	3788
Total output	4006
Depreciation	197
Value added	1331
Net income	1058

In the light of these data, the ratio of raw materials to total costs as given in the study seems to be very low. In fact there is hardly an industry falling in the main group of similar industries where the emoluments figure is higher than the materials costs. This needs looking into.

(2) While the impact of the devaluation of the rupee is visible in the abnormal escalation of materials cost in 1967-68, the subsequent downward trend is not clearly understood. Is this decrease in subsequent years due to the rationalising of purchasing operations which, if true, is highly commendable, or is it due to reduced volume of purchases, which seems more likely in view of the disturbing performance of the undertaking? The latter is encouraged by the fact that the ratio of materials costs to total expenditure remained almost the same for the post-devaluation period.

(3) It appears that purchasing operations of the unit have not been gone through, possibly because of the low percentage of materials costs to the total costs and also the assumed difficulty in examining them, as mentioned in the study. As regards the low materials costs I have already expressed my doubts at (1) above. Examination of purchase operations is not such a difficult task that it cannot be undertaken in post mortem. There are certain basic points which need checking. Whether purchases were made in a competitive manner or were the orders placed on past suppliers without regard to the reasonableness of their rates? What steps were taken to effect reduction in costs by way of value analysis of specifications, use of substitutes, etc? What were the arrangements for ensuring quality control of materials purchased? Were these tested and checked by the factory properly or were the materials got tested at a reputable laboratory in India or abroad? How were the payments made, in advance or after receipt of correct materials? These are some of the points which on scrutiny would reveal the effectiveness of the purchasing operations. I wonder if the writer had gone through these issues. These are very relevant as leakage through faulty purchase operations has been the undoing of many undertakings and these usually go unchecked.

Invasion of Kampuchea

THE Working Panel of the Analysis' Forum, Bombay, in a meeting held on January 19, adopted the following resolution:

(1) The Panel unequivocally condemns the Soviet backed Vietnamese aggression in Kampuchea and appeals to all the democratic and freedom-loving forces in India and elsewhere to extend and mobilise support for the people of Kampuchea now involved in a just struggle against the Vietnamese aggressors who are working at the behest of Soviet social imperialism which is desperately trying to execute its 'collective security' plot in the form of an Indo-Chinese Federation.

(2) The Panel has firm conviction in the ultimate victory of the Kampuchean people fighting under the leadership of Prime Minister Pol Pot and the Communist Party of Kampuchea. The recent formation of a Democratic and Patriotic Front for National Unity is a welcome development. The war in Kampuchea is a people's war in which the tactics of guerilla warfare are being heroically employed and is going to be a protracted war.

(3) The Panel observes that the aggression in Kampuchea has further demonstrated the correctness of Mao Zedong theory of three worlds, according to which Soviet social imperialism, cloaking itself under the garb of 'national liberation' stunts and flaunting the red banner, is the number one enemy of the peoples of the world and the most dangerous source of world war. An international united front of all countries and peoples against this fascist menace is the need of the hour. The Panel particularly condemns Enver Hoxa and the renegade Albanian leadership who, in the name of fighting everybody and all imperialism, are rendering useful services to the Soviet social imperialism, and are openly supporting the Vietnamese invaders. The Panel also condemns the CPI (M) leadership which, by supporting the Soviet social imperialism in Kampuchea, has now completely exposed itself as yet another variety of a renegade revisionist party.

Charan-ing the Finance Ministry

Romesh Thapar

THE Janata party's credibility in the Capital can be measured by the overwhelming number of serious observers who believe that Charan Singh's opportunist re-entry into the Union Cabinet does not mean the end of in-fighting within this ruling formation. The Jan Sangh tangle with the BLD segment, particularly in Uttar Pradesh, is a sample of the new tensions that will take over — and Raj Narain notwithstanding!

It is rather naive to imagine that the Janata party can subdue the in-fighting by quiet deals at the leadership level. As the jockeying for power at senior levels becomes unashamed, the political unknowns in Parliament and the legislatures are beginning to turn their attention to the kind of problems which need urgent tackling and which might give the party the stamp of a meaningful ruler.

This thinking is becoming more pronounced, believe it or not, with the entry of Charan Singh into the Finance Ministry. While the familiar analysis tells us about the impending threat to national budgeting from a man obsessed with the village and contemptuous of the role of industry, the ground-level "intelligence" is that the party backbenchers are expecting Charan Singh and George Fernandes to go into a political-economic embrace on what has to be done in the rural areas. Indeed, even Madhu Limaye will approve!

Reading the daily press, one would think that George Fernandes is some kind of a crazy character who is only interested in nationalising Tata Steel and some third-rate automobile plants. Actually, the Minister for Industry is largely concerned with the problems of making small-scale industrial enterprise in the villages productive and viable. He believes, with many thoughtful economists, that this effort would create employment for many millions and build the demand on industry for goods which the rural population cannot afford at the moment.

Of course, there are dangers inherent in any major economic restructuring. Defective co-ordination can create shortages and inflationary situations. However, the concern of George Fernandes is to get his District Industrial Centres launched and to build markets for the produce of village industry. Within the Janata party, the thought occurs that Charan Singh in the Finance Ministry can become a major lever in support of these policies.

One of the factors in the Janata party's lack of credibility has been the absence of any determination to implement the rural correction or orientation. George Fernandes' projection of his new policies was not matched by Finance Ministry and Planning Commission commitments. The party's activists, and they are not to be ignored in the northern states, lived in a make-belief world of expectancy and frustration. All this may well change in the coming months as Charan Singh settles down to budget for his kisans.

I do not know whether the peace-makers and patch-up men realised all this when they were pushing for a balance of power between the three old men of the party. I doubt it. And as you focus on this kind of stirring in the Janata party, it is possible to get an idea of the political fall-out. As part of the policy of rural revival, there is mounting suspicion of the role that traders and large industrial houses are likely to play. Is the Jan Sangh antagonism to Charan Singh also rooted in similar calculations? It's worth looking at.

Charan Singh is not a very reliable factor in any national assessment. He is too mercurial and given to unbalanced generalisations on economic and political theory. And there is the unexpected factor of Raj Narain lurking in the corners of the political arena. But it appears that the realisation is now widespread that the politician as such has become a symbol of contempt and ridicule, and all parties feel that something will have to be done soon to change the image. The manipulators of the ruling Janata party cannot be unaware of this powerful sentiment.

Even the demoralised and confused ranks of Congressmen, conscious that the old core support is returning to the party despite the endless bickerings over unity manoeuvres, are beginning to wonder whether they have not lost sight of the critical issues in their intense cogitations over Indira Gandhi and her inexplicable equation with her unrepentant son, Sanjay. In their minds, the question forms: will we for ever be political fodder for mother and son in their court battles?

Maybe, solid sense will prevail when Swaran Singh has finished his marathon negotiations which have no beginning and no end. Maybe, for Congressmen continue to lack confidence in themselves — and Indian Communist emissaries from Moscow continue pushing Indira Gandhi as the person to be supported!

It is a pity that Prime Minister Morarji Desai did not move Jagjivan Ram into the Home Ministry — or even Chandrashekhar. The Janata government is too complacent about the fears of the Harijans and the Muslims. These two segments are crucial to the calculations of the Congress groups, and the Janata party continues to drag its feet about their future security and well-being. H M Patel could do a great deal to establish new frameworks of real justice and equality to replace the vague commitments of the past, but will he be allowed to move?

That's how it is as we begin the second phase in the Janata party's attempt to remain united and to regain its coherence as an alternative to the Congress. In this context, the ripples from the Finance Ministry will be worth study.

January 27

ICICI

INDUSTRIAL CREDIT AND INVESTMENT CORPORATION OF INDIA (ICICI) has made notable contribution in the field of development banking during the last 24 years of its existence. Its net sanctions have reached Rs 1,053 crores. According to James Raj, new chairman of the corporation, this assistance has gone to over 1,200 companies for nearly 2,500 projects of medium, large and small sizes covering various industries like fertilisers, petro-chemicals, power generation, sugar, cement, paper, textiles, machinery manufacture, electrical equipment, etc. Its normal function as a development bank apart, the corporation has also played an important role in institution building. It has identified gaps in the institutional structure and tried to fill these.

Financial Innovativeness by Government Company

Hansavivek

MYSORE PAPER MILLS is going ahead with its Rs 100-crore expansion scheme. Loans from public financial institutions, commercial banks and Chemical Bank, New York, have already been tied up to meet the major part of the financing needs of the project. An amount of $ 25 million has already been drawn out of $ 35 million of loan from the Chemical Bank and used for the project. As a part of the financing scheme for the project, the company has to increase its paid-up capital. It is proposed to make a bonus issue in the proportion 1:1 and thereafter a 'rights' issue in the ratio 1:2. In addition, it is proposed to make an issue of 32,78,100 equity shares of Rs 10 each to non-resident Indians who have intimated their intention to invest in the company, and of 42,21,900 equity shares to the government of Karnataka which intends to maintain the existing percentage of its stake in the company's capital. All these capital issues will raise the company's paid-up capital from Rs 1.5 crores to Rs 12 crores. As a means of raising immediate finance for the expansion project and also for setting up a sugar factory, the management has also considered a scheme of issuing 10 per cent unsecured convertible bonds. The proposed sugar factory will be an integral part of the mills. This integration of paper and sugar is the first of its kind. Production services and utilities of the paper unit will be beneficially made use of for the sugar unit and bagasse produced by the sugar unit will be an essential raw material for the paper unit. The company has concluded agreements with Jaako Poyry Engineering of Helsinki for expert assistance for project monitoring in addition to the National Industrial Development Corporation who would attend to detailed engineering and implementation of the expansion project. Equity holding of the state government has increased to 56.22 per cent of the total paid up capital of the company, since it acquired the shares from Jalan group. MPM has, therefore, become a government company. During 1977-78, it produced slightly more at 26,167 tonnes against previous year's 26,118 tonnes. Net sales amounted to Rs 8.96 crores against Rs 8.33 crores, but gross profit was lower at Rs 100 lakhs against Rs 107 lakhs. With both depreciation and taxation requiring less, net profit turned out to be higher at Rs 51 lakhs (Rs 39 lakhs). The proposed unchanged dividend of 10 per cent is covered 2.73 times.

BINNY has sunk deep into the red and is being rescued by the Centre and its financial institutions. The company requires Rs 17 crores for its long term viability which is aimed to be achieved by implementing a modernisation and rehabilitation programme. The financial institutions will provide, under their soft loan scheme, Rs 10 crores and the

Central government the remaining Rs 7 crores. In addition, State Bank of India has granted concessions in interest with effect from January 1, 1978. With the revival of markets and improved raw material position, the current year's outlook appears to be satisfactory. Production has stabilised in both the mills, but the recent ordinance imposing an additional excise duty is likely to have an adverse effect. During 1977-78, the company showed further net loss of Rs 4.47 crores, as against the previous year's Rs 9.26 crores. After making certain adjustments, the accumulated loss has increased from Rs 16.77 crores to Rs 20.88 crores to stand against a share capital of Rs 7.06 crores and reserves of Rs 2.44 crores. The performance of the textiles division improved considerably during 1977-78, even though the operations of the Bangalore mills were disrupted because of a strike followed by a lockout for almost two months on the bonus issue. Steps were taken to speed up rationalisation in the textile units and agreements were reached in some of the departments. Further progress is expected during the current year. The trading and agency division continued to do well and maintained its performance. Efforts are being made to get more agencies. The performance of the engineering division has been satisfactory and is expected to improve in the coming years. There have been quite a few changes in the board J R Joshi, who was appointed as an additional director on February 24, 1978, resigned on May 29 and in his place B Ramu was appointed as a director. Jaykrishna Harivallabdas, the well known industrialist from Gujarat, was appointed as an additional director on May 25, 1978. A Padmanabhan vacated the office of managing director with effect from April 2, 1978, and in his place P Unnikrishnan was appointed.

INDIA FORGE AND DROP STAMPINGS has fared well during 1977-78. With sales up from 1.17 crores to Rs 2.48 crores, the company earned a gross profit of Rs 31 lakhs as against a trading loss of Rs 8 lakhs incurred previously. After depreciation, there is a net profit of Rs 21 lakhs against a net loss of Rs 17 lakhs. This outcome has enabled the company to return to the dividend list with a 10 per cent payment on equity after an absence of three years besides disbursement of the usual dividend on preference shares including arrears for 1976-77. What is more, the company has also been able to plough back a surplus of Rs 15 lakhs to the general reserve. These results have followed increase in production from 847 tonnes to 2,149 tonnes even though there was a poor offtake of the company's products during the first half of the year due to disturbed conditions in several vital auto ancillaries. The previous year's operations were crippled by a prolonged lockout in the company. The management has concluded a 3-year agreement with the labour union involving revision of wages and benefits. It also provides for increase in productivity of the plant which in the past has been a recurring source of friction in the company's industrial relations. Manufacturers of commercial vehicles are planning to double their current production over the next five years. With a view to expanding and diversifying its range of products and services, the company is setting up facilities for foundry operations at Faridabad in Haryana with an initial annual capacity of 600 tonnes of alloy iron castings. The forging capacity is being augmented by establishing a plant at Poona for manufacture of automotive forgings with integrated facilities to cater primarily to the market in Western India. These proposals are intended to be implemented in stages.

UNICHEM LABORATORIES' chairman, A V Mody, complains that the old drugs price control order is still in force and has not been revised, although the Central government had announced its new drug policy in April last. "This is a classic case of administrative delay", he remarks. He also observes that for want of specific basic guidelines, applications remain pending and they are cleared or rejected in an arbitrary manner. Referring to the difficulties faced by Unichem, he says it is not allowed expansion of its production capacities at Ghaziabad on the ground that it is a developing urban centre. The company can compete and grow by cutting down its overheads through expansion at existing places and by marketing new products. It has spare capacities for formulations available both at Bombay and Ghaziabad. Under the present industrial policy, even a new formulation requires a new industrial licence. A blanket ban on new industrial licences in urban centres means every new formulation will have to be manufactured by setting up new facilities at places other than Bombay and Ghaziabad. Unichem's 1977-78 results show higher sales with lower profits. Thinned margins are attributed to rise in materials costs and higher wage bill. As a result of a settlement arrived at with the union, the company had to pay arrears for the past two years, extra bonus and revised incentive bonus. The management feels that with the co-operation of employees better results will be achieved in coming years.

KOLMAK CHEMICALS is making a public issue of 3.10 lakh equity shares of Rs 10 each at par to raise a part of the funds required for its Rs 1.65-crore project for manufacture of 1,350 tonnes of rutile grade titanium dioxide, 400 tonnes of basic chrome sulphate and 100 tonnes of green chrome oxides and its derivatives per annum in technical collaboration with Indian Oxygen which has developed the processes for manufacture of these products at its research centre. The project is located at Kalyani, a 'backward' area in West Bengal. The company has been promoted by professional managers — headed by P C Basu, who is ex-deputy managing director of Indian Oxygen. Production of chrome chemicals is expected to commence within a year and that of rutile grade titanium dioxide in about two years. Chrome Chemicals are used mainly for leather tanning, metal treatment and for manufacture of chromium metal and ferro chrome and various other products. Titanium dioxide is used as a raw material in the paint, paper, plastic, rubber, printing ink and other industries. Almost the entire quantity of titanium dioxide, which Kolmak proposes to manufacture, is now being imported. Kolmak's expected cost of production compares favourably with the landed cost of the imported product. It does not envisage any difficulty in marketing its entire output which represents a small fraction of the country's total demand for rutile grade titanium dioxide. Of the total share capital of Rs 50 lakhs, Indian Oxygen is taking up 26 per cent and promoters and their friends are taking up another 12 per cent and the balance is being offered to the public for subscription. The subscription list will open on February 14. The public issue is managed by the merchant banking division of Grindlays Bank.

IOL Indian Oxygen Limited

Chairman's Statement

Mr K D MOORE

(The following is an abbreviated version of the Statement of Mr K D Moore, Chairman, Indian Oxygen Limited. The full text has been circulated to the shareholders along with the Company's Annual Report for the year ended 30 September 1978).

The performance of the economy during the past year has not been uniformly satisfactory. Although the year ended 31 March 1978 recorded a growth rate of about 5% in GNP, this was mainly due to an increase of over 10% in agricultural production Industrial production increased by less than 4% as against 10.4% in the previous year; this increase too was mainly accounted for by certain sectors of industry

Since April 1978 the overall industrial growth rate has picked up slightly, but this higher growth rate is still not broadly representative as major industries like engineering and textiles are not amongst those which have recorded an increase in output. The industrial scene has moreover been beset by serious problems such as shortages of coal, power and wagons. The shortage of coking coal and power in turn has affected the production of steel.

The early part of the year saw widespread industrial unrest, notably in Maharashtra and South India; recovery from the effects of this has been slow in West Bengal where some 60% of IOL's employees and capacity is located and in Northern India, serious power shortages developed in 1978 and are likely to continue.

The climate for investment continues to be unfavourable. Some of the pronouncements of Government spokesmen and recommendations of Government appointed committees such as the Sachar Committee, have created serious apprehensions in industrial circles. Neither are credit policies and lending rates helpful.

Reference must also be made to the guidelines recently published regarding top management remuneration in the country. We believe these guidelines to be seriously detrimental to the motivation and professionalisation of management which Government avowedly seeks to promote.

It is disappointing too that the positive and necessary new policy of the present Government, in giving priority to rural and small industry development, has had its counterpart in a negative approach to organised industry in the private sector. The need to prevent stagnation in organised industry, the growth of which has been a source of pride and strength to the country over the past decade, has been paid lip service, but the practical effect of persisting in present policies cannot be ignored indefinitely

The result of longstanding denial of growth is inevitable decline, which will unfortunately be reflected not merely in reduced profits but more importantly to the country, in increasing technical obsolescence and reduced standards of performance. Surely this must be a matter of grave public concern, especially where it involves a technology-based industry whose products are vital to almost every kind of manufacturing and infrastructural activity in the country.

OPERATIONS

Although the turnover for the year at Rs 49.9 crores slightly exceeded the previous year's, volumetric sales of most major products were lower. The impact of severe power shortages in some parts of the country, of industrial unrest affecting customers' activities especially in the west and the south, and of demand slack in certain sectors of the economy adversely affected sales. Loss of production and increased operating costs from power interruptions and shortages are calculated to have caused loss of profit by upwards of Rs 80 lakhs. This loss in conjunction with substantial increases in materials and employee costs could not be fully recovered in higher prices and brought a marked fall in IOL results after the improved figures of the two previous years.

PROFIT, TAXATION & DIVIDEND

The profit for the year before taxation amounted to Rs 3,16,29,800 as against Rs 5,10,16,493 last year, after providing depreciation of Rs 1,00,54,000 (previous year Rs 96,82,000) and interest charges of Rs 1,04,92,000 (previous year Rs 86,07,962). The setback in operational performance, coupled with all round cost increases—the major part of which had to remain unrecovered through pricing action because of depressed market conditions and stiff price resistance, particularly from Government and quasi-government customers, was mainly responsible for the sharp decline in profits.

Tax provision for the year amounted to Rs 1,45,00 000 (previous year Rs 2,94,00,000) leaving a net profit of Rs1,71,29,800 as against Rs2,16,16,493 last year. After transferring Rs27,00,000 (previous year Rs 28,00,000) to Investment Allowance Reserve and bringing back Rs 7,00,000 (previous year Rs13,00,000) from Development Rebate Reserve and taking into account Rs 16,04,241 brought forward from previous year the amount available for appropriation was Rs 1,67,34,041 as against Rs 2,31,24,241 last year.

In view of the substantial disinvestment of shares by the Company's major shareholder, BOC International Limited, your directors considered it fair and equitable to declare an interim dividend at the rate of 12%, subject to deduction of tax, payable on 1 December 1978. This was also necessary as the selling price for the shares to be disinvested was fixed on the basis of ex-dividend transfer. After careful consideration your directors have decided to transfer Rs 28,00,000 to General Reserve and to recommend payment of a final dividend at the rate of 3% subject to deduction of tax, leaving Rs 16,14,041 for carry forward to next year. If approved by the members, this final dividend, together with the interim dividend already declared, would represent the same quantum of distribution as in the previous year, although on an enhanced capital base resulting from the last Bonus Share issue.

FINANCE & SHARE CAPITAL

Due to depressed trading conditions, it became increasingly difficult to generate adequate cash flow to take care of the inflationary pressures on working capital and at the same time to meet the pressing need for capital expenditure to maintain and improve operational efficiency. To meet the shortfall, overdraft facilities were enhanced from Rs 640 lakhs to Rs 815 lakhs on a consortium basis from Punjab National Bank, The Chartered Bank, Grindlays Bank Ltd. and United Bank of India. In addition, necessary permission was also obtained from

the Reserve Bank of India for accepting deposits up to Rs 100 lakhs. Both the facilities are being fully utilised.

As a result of the issue of 20,53,333 new ordinary shares of Rs 10 each as Bonus Shares, the issued and subscribed share capital of the Company increased from Rs 6,16,00,000 to Rs 8,21,33,330 during the year. Under the Foreign Exchange Regulation Act, 1973, the Reserve Bank of India ultimately decided that the foreign equity participation in the Company should be brought down to a level not exceeding 40% In the absence of Government approval of any worthwhile expansion or diversification projects which might justify a new capital issue by the Company, it was decided to comply with the Reserve Bank's decision by BOC International Limited disinvesting 21 60 440 Shares in the Company by 'Offer for Sale' Members are already aware of the manner of this disinvestment and the terms of the offer I am sure our Indian shareholders will welcome this opportunity of increasing their equity participation and at the same time of reaffirming their faith and confidence in the Company I also trust that the members are pleased to see that some Shares have been reserved for the employees and business associates of the Company BOC International Limited has agreed to retain the sale proceeds of the Shares with your Company as an interest free loan until they are repatriated in the phased manner laid down by the Bank

MANAGEMENT & PERSONNEL

Within the Company, industrial relations remained generally satisfactory with only minor disruptions Following negotiations with the Unions substantial benefits were extended to the Company's units in West Bengal and at Gauhati and Ranchi by way of additional dearness allowance. Settlements on fringe benefits were also reached with Unions representing the majority of the Company's units Negotiations with the Unions at the remaining units remain inconclusive, but we shall persevere in our efforts to reach amicable settlements

Through sustained efforts over the recent years, a management develop ment system is now well established During the year the Company's training activities were expanded For the first time a residential development programme for supervisory staff was held The welfare activities of our employees continued to receive close attention. I am again pleased to record appreciation of the loyal efforts of workers and management without which even the somewhat disappointing results of the past year would not have been possible. The Company is no longer in a situation where it can operate successfully with efforts any less than the best on the part of all. The emergence of competitors for almost all our products requires that not only the quality of our goods and services should be high, but also that we give great attention to our costs Aspirations for monetary reward and remuneration will need to be moulded against this background.

DEVELOPMENT & EXPANSION

My statement last year referred to the further efforts on the part of the Company to obtain the approval of the Government of India in regard to the Company's major diversification project for manufacture of a range of castor based chemical products Nearly 4½ years have elapsed since the project was submitted to the Government for approval and a final decision has yet to be communicated to us Over this period there have been substantial changes in world market conditions which make it now uncertain whether the project would still be viable.

My statement last year also referred to the industrial licence application in respect of a new factory at Barbil, Orissa, for manufacturing liquid oxygen explosives This application has unfortunately recently been rejected but a final representation to the Industry Minister will be made shortly in view of current urgent need for explosives in the country

An application has recently been submitted for Government approval of manufacture of continuous welding consumables and submerged arc welding fluxes at our Ambattur factory The proposal is designed to meet the rising domestic demand for these products which are used in the sophisticated automatic welding processes being increasingly used The project involves technology which has been developed within the Company and we hope that the proposal will be considered favourably

At the Annual General Meeting held in February 1977, the shareholders approved the investment by the Company in the equity shares of a new company which would utilise the technical know-how developed at the Company's Research and Development Centre We have now received the necessary approval of the Government of India for investment of Rs 13 lakhs in the equity capital of Kolmak Chemicals Limited, which will undertake manufacture of titanium dioxide and certain other products used in the paint industry Kolmak Chemicals Limited is progressing in its project satisfactorily and I hope that the collaboration between the two companies will be a mutually beneficial one.

SOCIAL CONTRIBUTION

We believe our prime social contribution should be through the service we provide to our customers and through the responsible and sensitive discharge of our duties to our employees. In addition, we seek to be good citizens and especially to assist weaker and distressed members of the community The Company contributed Rs 5,60,000 in the aggregate for relief work among the victims of cyclone in Andhra Pradesh and Tamil Nadu last winter and of the recent floods in West Bengal, Bihar, Uttar Pradesh and Delhi For relief work in West Bengal, most employees of the Company's units in the State have contributed one day's earnings. We have also granted some advance to those employees who have been affected

The Company is one of six companies which have sponsored a rural development programme under the aegis of The Bengal Chamber of Commerce & Industry in a backward area in Barasat Block not far from Calcutta. Contributions were made to more than one institute for management studies and All India Management Association Our executives are encouraged to play meaningful roles in organisations which work for furtherance of social welfare and professional development.

PROSPECTS

Given stable industrial relations throughout the country generally, the improved rate of industrial growth in recent months should be sustained. Whilst operations in Eastern India will continue to be hampered by shortage of power, IOL can expect to benefit from increasing demand both for its traditional products and for its growing range of higher technology gas and equipment products Pressures on costs and prices will remain but we anticipate that a degree of recovery from the reduced profit level of 1977/78 will be achieved

As to the longer term future, much will depend on Government attitudes now that IOL is no longer a foreign controlled Company Whilst the Company will continue to seek worthwhile opportunities for expanding its range of activities into other fields in which it can use its technologies, know-how and management expertise to advantage, the sustenance and health of our existing main businesses remain essential to the long term well being of the Company and will continue to be our first priority.

Calcutta
7 December 1978

K D MOORE
Chairman

Caste Idiom for Class Conflict: Case of Khanjawala

Anjan Ghosh

THE belief still persists that the caste system in India is a relic of the past which will disappear once industrialisation gets off the ground. It is not often realised that industrialisation *per se*, especially in a peripheral social formation, can hardly lead to the eradication of caste discrimination. The specificity of a peripheral social formation arises from the precise nature of interaction between the capitalist and pre-capitalist elements within it. In India this interaction is manifested in *the nature of caste-class configuration* and conflict. In this report we hope to illustrate this specificity with the case of Khanjawala.

About 30 kms north west of the capital city of Delhi, in Nangloi block, lies the village of Khanjawala. The genesis of caste conflict in the village can be traced back to 1970. At that time 120 acres of the village grazing land had been distributed to 120 low caste families in the village for a period of five years. But it took seven years before the simmering caste tension erupted into violence in October 1977. In 1975 when the initial period of lease had run out there had been resistance to its renewal from the higher caste landowners who had taken the matter to court. But under the Emergency, the Delhi Administration overrode the decision of the Gaon Sabha to take back the land. Thus the lease had been extended for another five years. However, the Dalits were unable to cultivate the land till the end of the Emergency. After March 1977, when the Janata Party had assumed power, the allottees were allowed to cultivate the land under police protection. The reaction followed in October 1977 when the landowners, predominantly Jats, invaded the fields of the Dalit allottees and trampled over their crops with 250 heads of cattle. During the clash which ensued a number of landless and landowners were injured. A police picket was posted in the village after this incident.

The village of Khanjawala consists of [illegible] households. Of them about 16 per cent are Harijan (Dalit) families, 18 per cent non-Jat and *non-Harijan* families and 66 per cent Jat families. About 400 households are landless and subsist on non-agricultural employment. With regard to agriculture, none of the households own more than 30 acres of land, and except for three or four families most of the others have less than 88 acres (*IE*, July 30, 1978).

On July 7, 1978, the police picket posted in Khanjawala remained mere spectators to the orgy of violence unleashed upon the Dalits (mostly Chamars) by the Jat landowners of the village. Since then the conflict has been institutionalised.

A Bhumiheen Sangharsh Samiti was formed by the landless of Khanjawala, mainly the Dalits and other non-Jat low caste people, to protect their rights against the Jats and other higher caste landowners. The latter had already formed the Kisan Sangharsh Samiti.

Both the groups held their convention on July 30, 1978. About 10,000 people attended the landowners' rally (ST, July 31, 1978) which about 150 attended the meeting of the landless. The landowners came from Delhi, Haryana, UP and Rajasthan. For them proper arrangements had been made. Preparations had been afoot for some time to make it a massive show of strength. Funds and grain had been collected from nearly every house in the village. *Delegates coming from outside the* village were to be accommodated either by their kinsmen or in the 'spacious chaupal' in the centre of the village (*TOI*, July 28, 1978). Those who came for the Kisan Sangharsh Samiti rally streamed in throughout the day on foot and in trucks, bullock carts, camel drawn carts and tractors. Among them were a 'fair sprinkling of women' (*TOI*, July 31, 1978).

The *kisans* (i e, landowners) raised slogans like, 'kisan ekta zindabad', 'lathi danda khaenge, bhoomi ko wapas layenge', 'Jagjivan Ram murdabad', etc. Although they denied any hostility to the Dalits, yet most of the members were Jats or higher caste landowners from surrounding areas. The secretary of the Samiti was a Jat, Samar Singh Samar, while the President was a Brahmin, Pt Kheri Singh. Members of the Samiti were ostensibly drawn from all castes (*IE*, July 29, 1978). But it was not caste solidarity which held them, but their common interest in maintaining the present *status-quo* with regard to landownership. It is interesting to note that the secretary said that speakers at the rally would be representing their 'khaps'. Khap means a clan council which holds or dominates in a number of villages. The word is usually associated with the Jat clan council (M C Pradhan, "The Political System of the Jats", Bombay, 1966).

As the dominant caste in the region, the Jats dominated the rally (*ST*, July 31). They demanded: (a) that all distribution of *charagha* to the landless should be stopped; (b) official patronage should be extended on economic rather than caste basis; and (c) the division of people on caste lines should be ended. They resolved that they would present a petition to the government soon and, if even then nothing happened, they planned to hold a rally in front of the Prime Minister's house on August 13, 1978. The kisan leaders *blamed the government for politicising* the issue, as if the conflict over land was just a community affair. Their main resentment stemmed from the 'pampering of Harijans' by the government (*ST*, and TOI, July 31, 1978). The dispute is over land but it has acquired caste overtones as the landowners are predominantly Jats while the landless are Dalits. Yet the mobilisation over this conflict reflects the admixture of ritual and economic status Later we shall analyse some of the reasons for this.

After the kisan rally was over the meeting of the landless began, in the Dalit quarters of the village (*TOI*, July 31, 1978). The Delhi Pradesh Grameen Sramjeevi Union associated with the CPI provided leadership to the Dalits. The action committee which was formed as the Bhumiheen Sangharsh Samiti, called for immediate distribution of grazing land to the landless. In a later meeting they called for retrieval of lands which had been wrongly occupied by the landowners (*ST*, August 7, 1978). The meagre attendance at the meeting shows a definite lack of resources as compared to the kisans. Thus only the villagers from Khanjawala and nearby villages had come. Another contributory factor could be that most of them go out of the village to work and consequently could not be present at the meeting. For the Dalits dependence on the landowners within the village or on the world external to the village was a definite constraint.

While the leaders of the Kisan Sangharsh Samiti seemingly did not visualise the conflict in terms of case and were at great pains to "emphasise that they had nothing against the Harijans 'who are our brothers'" (*TOI*, July 31, 1978), yet they felt that they

were defending their traditional and customary right over the grazing land (*IE*, July 30, 1978). That the Delhi High Court had upheld the petition of the Gaon Sabha to retain the 120 acres of land as village grazing land after the expiry of the five year lease in 1975, added to the legitimacy of their demands. According to the Court judgment, it was the Gaon Sabha and not the government which could allot land (*IE*, July 30, 1978; *ST*, July 31, 1978). *On the other hand* the landless felt that instead of five year leases they should be given permanent rights over the allotted land and that the government had the authority to allot it to them.

On August 27, 1978, thousands of landowners attended a meeting of the Sarv-Khap in Khanjawala and decided to gherao Parliament House on August 30, if their demands were not conceded. After the meeting about 200 of the farmers courted arrest on the outskirts of the village. The meeting significanty was called a Sarv-Khap, a meeting of all peasant communities but not necessarily of all castes (*ST*, August 28, 1978; D Swamy, "The Khanjawala Agitation", *Frontier*, October 21-28, 1978). It is interesting to note the use of traditional caste idiom for a political issue. Originally Sarv-Khap means a meeting of the all-clan council which controls a *particular area* (Pradhan, *op cit*, p 6). But here caste and communal solidarity was being expressed for secular ends. The final list of demands as put forward by the Kisan Sangharsh Samiti included seven items, a skilful admixture of the interests of the rich and middle and small peasantry. It included:

(1) Pasture land should be provided in every village.
(2) Economic condition rather than caste should be the basis of job reservation, promotions, scholarships in education, etc.
(3) Irrigation rates should be brought down to the pre-1975 levels.
(4) The relationship between the prices of agricultural produce and those of fertiliser, seeds, pesticides, tractors, pumpsets, etc, should be fixed at the 1970 levels.
(5) Land in excess of the ceilings should be distributed amongst the cultivating marginal farmers and village industries should be established to provide jobs to the members of the landless families.
(6) The procurement prices of agricultural produce should be determined according to the cost of production.
(7) The government should not acquire cultivable lands under any circumstances. (Source: Swamy, *op cit*.)

Note the similarity with the charter of demands of the Kisan Rally on December 23, 1978.

Since then the Kisan Sangharsh Samiti have held rallies before the PM's residence and in front of Parliament. Sometimes there have been clashes with the police, at other times they have courted arrest. Not only have the men been mobilised but also the women. The struggle against the 'governmental pampering of Harijans' continues. According to an unofficial estimate three to six thousand people are in jail. In the rest of this report we shall try to analyse the significance of Khanjawala.

It is important to note that Khanjawala is located in what is known as the 'Green Revolution' belt. Capital intensive agriculture introduced as the 'Green Revolution' has had certain *social and economic* consequences. First, while it has increased inequality of income, it has also promoted a form of large-scale cultivation based on economies of scale. As a result, while the marginal farmers are increasingly reduced to wage labour, even the small and middle peasants find it extremely *difficult to maintain a semblance* of their earlier standard of living.

*In effect they are squeezed by the in*trusion of capitalism in agriculture which places the control over capital and credit in the hands of the kulak. Secondly, the Dalits who constitute the bulk of the landless agricultural labourers, have by virtue of the policy of protective discrimination been able to find entry, though on a very small scale, into urban jobs and occupations. Many of them are keen to move to the urban areas to obliterate the stigma of their ritual status. Others who live near a city, as in Khanjawala, seek to combine residence in the village with secular occupation in the city. This makes them visible in the village as a newly prosperous section compared to their earlier situation. Moreover, this shift of the Dalits into urban employment means that agricultural labour becomes scarce and this may at times lead to a temporary rise in the wage rates of agricultural labour, thus affecting the interests of kulaks. Again the Dalits' newly acquired prosperity needs to be contrasted with the relative impoverishment of the small and middle peasants. The latter belong to the regionally dominant castes, like Jats in the case of Khanjawala, and consequently resent their downward mobility relative to the improvement in the position of the Dalits. Thus the disparity *within* castes (i e, classes) gets projected into that *between* castes. The traditional relationships of subordination and superordination within the caste system is vouched for as the ideal social order. In other words, class positions are sought to be justified in caste idiom, obscuring the actual focus of *conflict*.

This is more so in areas where a particular caste has acquired dominance in the recent past, and so have a greater stake in maintaining the traditional system of exploitation. Any challenge to the existing order is thus seen as a threat to their position. Thirdly, while economically losing out, the small and middle peasants have not been able to avail themselves of education and other opportunities which would have allowed them entry into urban occupations like the bureaucracy, etc. Thus on a contracting agricultural base they still have to rely entirely on agriculture for their livelihood. So when they see the Dalits finding access to prized urban employment because of reservation, their hostility is easily diverted to this manifestation of disparity rather the real cause. Fourthly, for the kulaks who would like to pressurise the government for cheaper inputs for agriculture while getting higher prices for their produce, it is more easy and convenient to mobilise under a caste rubric because then economic differences and class antagonism can be conveniently overridden for their political gains. Also, they can get the support of the small and middle peasants against the Dalits and the government.

From the above it is not to be construed that the Kisan Sangharsh Samiti represents the interest of the small and middle peasants. It is in fact the kulaks who are leading them who have gained substantially from the Green Revolution and stand to gain from this movement. Moreover, since in 1980 the policy of Protective Discrimination will come up for review, if in the meanwhile they can mobilise they might be able to change the laws to their advantage. But while providing leadership, they realise that the support of the vast majority of small and middle peasantry is essential for the achievement of their ends. Thus the inclusion of the demand of redistribution of land to 'cultivating marginal farmers'. To maintain the numerical

preponderance of the movement, use of caste idiom and primordial loyalties help to obfuscate internal class differences. Thus within the movement we see a fusion of different classes with different interests held together by the primordial ties of caste and community. This may benefit the kulaks in the long run, but the small and middle peasants are ultimately bound to lose out. Presently the Dalits happen to be the victims, but are we sure the victims will not change?

[Abbreviations *IE* = *Indian Express*: *TOI* = *Times of India*, and *ST* = *Statesman*]

LABOUR

Jute Workers' Struggle

Timir Basu

BELYING the state government's hope that it would not last long, the strike of jute workers which began on January 5 is entering its fourth week at the time of writing. If the Indian Jute Mills Association (IJMA) sticks to its stubborn refusal to come to a fair settlement, 220,000 workers in 65 odd jute mills will have no alternative but to continue their long-overdue struggle. The root of this struggle may be traced to the promulgation of the Emergency when IJMA unilaterally increased the workload, retrenched some one lakh workmen, introduced contractual labour in the crudest form in contravention of laws, denied bonus and, to top it all, refused to renew the *tripartite* settlement which was to expire on December 31, 1975, as per the agreement of May 7, 1972.

All the central trade unions together put forward a 17-point charter of demands in December 1975, i e, on the eve of expiry of the 1972 settlement. The management did not even discuss the issues before the strike notice was served. The major demands of the workers include, upward revision of wages of all categories of workmen, with a need-based minimum as the basis for determining the wages of the lowest-paid workers, implementation of Raghunath Reddy's recommendations on badli workers, payment of dearness allowance as recommended by the *Bhattacharjee Commission*, fixation of the rate of adjustment for every point rise or fall in the linked series with 1960 base at Rs 1.65, immediate introduction of the West Bengal House Rent Allowance Act in the jute industry, payment of bonus for the years 1974 and 1975 and reinstatement of retrenched workers and withdrawal of additional workload imposed during the Emergency, ending of unfair labour practices like *bago* or contractual system in jobs of a perennial nature and assurance of statutory benefits like gratuity at the rate of 15 days' wages for every year of service.

The workers' overall monetary demand was Rs 100, but at the insistence of the CITU and its allies, the unions agreed to bring down their demand to a straight rise of Rs 75 in the basic wage, leaving the other issues to an expert committee. Management, on the other hand, offered a rise of just Rs 47, comprising Rs 28.50 in basic wage, Rs 15 in house rent and Rs 3.50 in DA. The management also demanded that the increased workload imposed during the Emergency should be regarded as the norm and proposed introduction of 21 shifts against the present 18 and monthly, instead of weekly, payment. The state labour minister's overcautious approach helped the IJMA to virtually ignore the government. At one stage the CITU allegedly decided to settle for a little over Rs 50, but the attempt was foiled by the SUC-controlled UTUC and its allies.

The IJMA's proposal of monthly payment system may seem *prima facie* reasonable, but the fact is that the workers' night allowance, shift allowance and production allowance will all be adversely affected if the weekly accounting procedure is changed to a monthly one without considering all these interconnected aspects. Again, the proposal to introduce 21 shifts in a week in place of the existing 18, without increasing the number of working hands virtually rules out the possibility of any holiday and results in consequent dilution of overtime benefit. Actually, this practice has already been in vogue in some units, as disclosed at the recently-concluded 40th annual conference of the CITU-led Bengal Chatkal Mazdoor Union. Thirty years ago, at the time of transfer of power, a worker in the jute industry had to produce 2.5 to 3 tons per year but now he has to ensure a production of 5.88 tons if not more. If account is taken of the decline in workers' real income on account of inflation, what this means is that workers now work more to earn less in real terms.

During 1976 and 1977 some one lakh jute workers had been thrown out of employment either through closure of mills or retrenchment. Casual workers, comprising more than 15 per cent of the total workforce, were hard hit due to adoption of unfair practices by the millowners. Despite reduction in workforce, the quantum of production keeps going up every year. The trade union circles fear a further cut in the workforce if IJMA's proposals for increased workload are accepted.

Even in money terms, the jute industry's total wage bill has remained virtually constant at Rs 100 crores over a decade. The share of salary and wages in total value of output of the top 40 mills, including the seven diversified ones, declined from 26.8 per cent in 1974-75 to 25 per cent in 1975-76. If the seven diversified units are taken by themselves, the decline will be even sharper.

The trend of wages of an unskilled worker in the jute industry speaks volumes for how poorly organised the jute workers still are, 50 years of trade union activity notwithstanding. Prior to 1948, the basic wage was just Rs 18 per month. There were meagre increases as a result of three tribunal awards in 1948, 1951 and 1958. Then in 1963 the Central Wage Board made the basic wage Rs 40.17, with a total wage of Rs 81 per month, including Rs 32.50 in the shape of variable DA and Rs 8.33 as Wage Board increment. Then for the next six years workers failed to get any increase. It was only in 1969 that they were able to sign a tripartite agreement guaranteeing Rs 167 as total monthly emoluments. Thereafter, the next break was achieved in 1972. As per the tripartite agreement dated May 7, 1972, the basic wage was fixed at Rs 160 per month and dearness allowance at Rs 75 per month, making a total pay of Rs 235. The DA was fixed as per the consumer price index number for Calcutta (base 1939=100) at 817 points with Re 0.25 per point rise or fall above 817 points.

The DA did not protect the workers against price increases because of the faulty calculation system which is nothing short of a crime against workers by the authorities concerned. Calculation of DA has been a bone of contention and, in the face of persistent agitation by workers on this issue, the government appointed a committee, popularly known as Bhattacharjee Com-

mission, to enquire into the matter in detail. The report of the commission did not, however, see the light of day. On the contrary, the then Ray government promulgated DIR in accordance with order No 7354 IR, bearing the date November 27, 1974, to stall the operation of the recommendations of the Commission. Instead, an *ad hoc* increase of Rs 16 was granted in DA as per the new consumer price index with 1960=100 as base instead of 1939=100. Simply the revocation of DIR can immediately release Rs 63 per jute worker, but surprisingly the CPI(M)-led government has been conspicuously silent on this question. The reported demand of the SUC-controlled UTUC that this be done, has been ignored. The highest pay drawn by an unskilled worker between November 1977 and January 1978 was Rs 401.55 per month when the CPI number shot upto 332 points.

On the other hand, the systematic rise in the workload is best manifested in the Bhagwala system which, though a most pernicious form of contractual labour, has not been fought in the proper perspective by the trade unions in the jute industry. The Bhagwala system, a kind of piece-rating, covers well over 40 per cent of the workforce in almost all the mills, it is alleged. A worker is asked to accept double the regular work norm in the carpet or hessian department and workmen are forced to hire outsiders, whom he pays out of his pocket, to fulfil the stipulated quota. These 'outsiders' are generally retrenched workers, sometimes of the same mill where they had once worked as permanent employees for years together, or women workers who happen to be wives of the respective workmen.

The severe neglect of women workers is another notable feature of the jute industry. There are only 3,000 female workers now against 30,000 in the late forties. Managements have systematically cut the number of women workers to avoid statutory obligations like maternity benefit, etc. Malpractices and violation of maternity act are also frequent.

It is unbelievable that workers in a long-established industry like jute should still be fighting for payment of gratuity as per the Act. The IJMA has been sticking to the formula of 13 days' payment instead of 15 days as provided in the law, on the ridiculous argument that since the month comprises 26 working days, half a month's gratuity really means not 15 days but only 13. This is in contravention of the law, but since the law is full of flaws IJMA is able to get away with it.

Another issue that has been hanging fire is the absence of graded scales for employees in offices and quality control department of jute companies. After the strike in 1974, there were some agreed points regarding introduction of graded scales for employees in offices and quality control departments, but even today 26 days form a month for these workers and nobody knows when all categories of jute workers will get a regular grade and scale.

Raghunath Reddy's award in 1972 on badli workers has also been a point of discord ever since it was made. At one time, it was agreed that 90 per cent of the total workforce would be assured permanency in service and the rest registered or given special badli work, i e, they would be guaranteed 220 days' work in a year. However, even the fringe of Reddy's award was not ever touched; on the contrary, the number of permanent workers was reduced, 220 days' work in a year was not provided and the unilateral productivity norm fixed during the Emergency came in handy for wage cuts — all of which triggered enormous discontent without any industrial action thanks to the ineffectiveness of the central trade unions.

Even this time the unions, though seemingly fighting unitedly, are actually divided. CITU and its allies had always tried to avoid the strike, despite the management's obdurate attitude. They were in fact forced to resort to the strike for fear of further isolation. But the CITU's presistent refusal to acknowledge the SUC-controlled UTUC (Lenin Sarani) has hastened the process of formation of an alliance of AITUC, UTUC (Lenin Sarani), a section of INTUC, HMS, BMS and NFITU against CITU, RSP-controlled UTUC and Forward Block-led TUCC, which is not centrally recognised.

The IJMA's plea of incapacity to pay more to the jute workers does not bear scrutiny. The profit in sacking, carpet-backing and hessian per ton has been of the order of Rs 500, Rs 600 and Rs 1,400, respectively, for quite some time, according to Niren Ghosh, president of the Bengal Chatkal Mazdoor Union. Clive Row, the citadel of the jute magnates, is heading for a bonanza of 1972 proportions, when profit after tax as percentage of net worth stood at 15, an all-time high and higher than that of all industries combined for that year. The oil crisis, which might turn worse if the turmoil in Iran continues, portends further profitable times for the jute industry.

On the other hand, distress sales of raw jute have been widely reported. The Jute Corporation has failed to provide even nominal support to the jute grower. The middle peasants or small intermediaries who constitute the lowest rung of village-level marketing structure, have suffered this season to the delight of the mills. Last week, the W-5 variety was available in Calcutta at far below the statutory minimum price. One of the demands of jute workers include fixation of raw jute prices at Rs 300 per quintal, but this demand has been on paper for a decade if not more without any action. Actually neither the unions nor the parties to which they belong have ever given serious thought to the issue. Marxists apparently think that the worker-peasant alliance can be built ignoring the material interests of the peasants.

With renewed efforts by the state labour minister, the stalemate in the jute industry may well be broken. But as matters stand now, workmen will get another hodge-podge which has become typical of almost every wage settlement.

BIHAR

Belchhi Now

Hemendra Narayan

THE nine square metre area in the centre of a well ploughed plot is untouched. It is green. It is a grim reminder of what happened on May 27, 1977 when on that spot eleven males including a boy of fourteen — nine of them harijans and all agricultural labourers — were burnt to death by a gang of rich kurmi farmers. But that is not the only reminder of the massacre. The surviving family members of the victims live in an atmosphere of constant threats emanating from those killers who managed to escape arrest as well as those arrested who have recently been released on bail. What stands between life and death for the harijan dwellers of Belchhi is the ten member police 'section' that is stationed at the village. The assurance that a police station proper would be set up at the village has not been kept by the government.

Several harijan families have abandoned the village altogether. Devnandan Rabidas now works at a shoe shop in Patna. Gulab Manjhi sells milk at Danapur, near Patna. Bishendev Paswan has shifted to Barbhiga. Mahendra Paswan who had a narrow escape on that day has gone to Biharsharif leaving his old parents at the village. The remaining people have been warned that something far more terrible than the event of May 27 is in the offing.

As before the mahatos are planning to implicate the poor harijans in false cases. Singhwa, the leader of the agricultural labourers killed 20 months ago, had also been branded as a criminal and had been implicated in murder cases, though chargesheets had never been filed, making it possible for the authorities to claim that the whole incident was a clash between two criminal gangs. This time they are thinking in terms of killing one of their own women, Shyama Devi, whose husband is in jail. The plot somehow leaked out and the police which was approached by both the harijans and Shyama Devi has registered a case of breach of peace. With their money the killers and those behind them are trying to buy off the witnesses in the case which continues to linger in the court. They are particularly interested in getting the charges against Inderdeo Choudhary, an independent MLA who is already on bail, quashed. This Choudhary who had carried out a Belchhi type massacre in Prasul village in 1975 has managed till now never to be convicted.

Apart from posting police, what the government seems to have done at Belchhi is distribution of relief. The attempt to distribute government land among the victims seems to have been foiled by the mahatos who were illegally occupying them. Six of the families of the victims were given government land about three kms from the village. While the plots of three were unculturable, three other harijans (whose plots were culturable) were chased away by those who were occupying it. The mahatos have already made known their opposition to such allotments. The father of Mahavir Mahato, the leader of the kurmis in Belchhi who allegedly led the raid on May 27, 1977, has taken possession of land allotted to Janaki Paswan and has told all that he is not quitting.

Out of the 25 mahato families who possess all the land in the village, ten have completely identified themselves with Mahavir. Most of the rest are also hostile towards the harijan families, and those mahatos who employ harijans have been warned The idea is to put so much pressure on the harijans that they will simply quit the village — as indeed some have already done.

PUNJAB

Settlers' Fight for Evacuee Land

Amarjit Chandan

ON January 18, the Punjab Chief Minister, Sardar Prakash Singh Badal, who is himself alleged to own hundreds of acres of benami land in Punjab and Rajasthan, announced the "historic" decision of his government to confer proprietory rights on small occupants of rural evacuee agricultural land upto five ordinary acres. In all about 12,000 to 15,000 families belonging to Ferozepur, Gurdaspur, Amritsar and Jullundur districts would benefit from the decision.

Though Badal claimed that with this decision "a vital election promise" of the Akali Dal had been fulfilled, in fact it is the organised struggle waged by abadkars (settlers) of Sanghowal (Jullundur) and Matewara-Hedon (Ludhiana) since the late sixties which made the present government concede their major demand Matewara-Hedon and Sanghowal are situated by the side of the Satluj river. Uncultivable land along the 65 miles long Satluj belt had been sold by the Central government to the Punjab government at a nominal rate of Rs 5 per acre in 1961. Harijan, jat and rajput abadkars had occupied land in the Satluj river bed in early sixties and started cultivation. The state government, however, decided to have potato seed-farms and sheep farms in the area and started forcibly evicting the abadkars The then CPI-Controlled PKS organised the abadkars and also took the issue to court. There was a clash between the police and the abadkars in August 1968. The Punjab High Court, in its verdict, held that it was a matter of state policy and that the land belonged to the state and not to the abadkars who had made it cultivable. On the pretext of curbing Naxalite activity, the state government let loose a reign of terror against the abadkars, who resisted by lying down before the government tractors. The situation improved with the Harchand Singh Committee Report (1972) and each abadkar family was given 4-5 acres of land, but without patta.

The Hedon abadkar agitation (1972-76) was notable because the abadkars, under the leadership of the PKS, waged a satyagraha against Banta Singh, who had occupied 450 acres of evacuee land. The struggle thus acquired an anti-landlord character. A peasant leader, Mohinderpal, was murdered by Banta's agents. With the Harchand Singh Report, Banta Singh's position became weak and the abadkars occupied 'his' land and

named the small colony of thatched huts as Swatantra Nagar, named after the late Teja Singh Swatantra, a communist leader of Punjab.

The Sanghowal abadkars' struggle is perhaps the only case of mass mobilisation by the CPI(M)-controlled PKS. In the Satlaj belt area of Sanghowal, 1,682 families, mainly of the Rai-Sikh tribe, had settled on 27,000 acres of land, out of which 8,000 acres were under river action. These people had migrated from West Pakistan in 1947 and settled in Ferozepur district. In 1957, because of the redemarcation of the Indo-Pak border, they were again displaced and had to come to Sanghowal in Jullundur district.

The state government had decided to start a seed-farm at Sanghowal with Soviet assistance. On October 23, 1968, a dozen Soviet-made tractors razed to the ground the huts of the abadkars and destroyed their standing crops; their water-pumps were also dismantled. Within a few days, a 27-member Abadkar Action Committee (AAC) was formed and a CPI(M) activist, Kulwant Singh, was elected its secretary. Deputations of abadkars met state officials and staged demonstrations. Now it became difficult for the government to hold open auctions of the evacuee land and to realise the land-tax. In mid-1969, the abadkars staged an impressive demonstration at Nakodar, armed with conventional weapons and even hoes, and presented a charter of demands to the SDM. The abadkars occupied the 150-acre farm of Gujjar Singh of Khaira Fauja Singh village and distributed the land among themselves. The illegal owner of the farm fled to his native town of Khanna. In June 1970, the Punjab police carried out the biggest-ever combing operation in its history from Ropar to Malsian to terrorise the abadkars. Every hut was searched and people were beaten up indiscriminately. In the same month, a joint Abadkar-Muzara convention at Ferozepur of the kisan wings of both the CPI and CPI(M) put forward the major demand of giving ownership rights to the abadkars.

In August 1970 the then Akali Finance Minister, Balwant Singh, announced in the Sanghowal kisan conference that every abadkar family, whether it had giddawri or not, would be given 4-5 acres of land with proprietory rights. Sanghowal fell in Balwant Singh's constituency.

Drawing a lesson from the Pepsu Tenants' Movement (1946-1951), the CPI(M) directed each abadkar family to occupy not more than five acres of land. During the Pepsu movement, occupancy and non-occupancy tenants had occupied land ranging from 20 to 100 acres. Later these tenants had not even voted for the CPI in the elections!

The Sanghowal leadership admits that in spite of their best efforts to integrate the tribal Rai-Sikhs with the other non-tribal sections of the peasantry of the adjoining areas, there was no success. A section of the Rai-Sikhs have already sold their occupancy rights, because they simply cannot afford farm inputs and have migrated to other places and started working as farm labourers.

The abadkars have thus got proprietory rights, not due to the grace of the Chief Minister, but thanks to their organised struggle.

MADHYA PRADESH

Janata on Way Out?

MADHYA PRADESH was a traditional Congress stronghold till the historic parliamentary election of 1977 when its jagirdari ended in what is one of strongest citadels of feudalism in the country. In the ensuing assembly poll the Congress was voted out of power for the first time in the 20 years of the existence of the state.

However, the scene is changing fast. The New Year began on a note of a likely transfer of power. The days of the Janata misrule seem to be over. The base of the ruling party, which had secured all but two of the forty Lok Sabha seats in the state and had crossed the two-third majority mark in the 320-member vidhan sabha later, has clearly been eroded as is apparent in its yielding ground to the Congress (I) in the civic election last month. In these elections, the Janata party and the Congress (I) both captured 26 municipal councils each of the 57 councils for which elections have been held. Both of them also shared equal seats in four others; and one, the Birla empire at Nagda, went to the CPI(M) and its allies. In the Chhattisgarh region, specially, the Janata party lost ground.

In the panchayat poll both Janata and Congress (I) claimed the allegiance of 65 to 75 per cent of the 15,000 elected sarpanchas. Since the elections were held on a "non-party basis", it is difficult to verify the rival claims. However, by the end of December, when the elections were held to choose 459 Janapad presidents, it became clear that the Congress (I) has certainly managed to retrieve much of the ground it had lost in the parliamentary and assembly elections. The party has made impressive gains in the Malawa and Nimar areas of Madhya Bharat region, considered the citadel of the former Jan Sangh. One of the reasons for the defeat of the Janata has been the anti-government feeling following the Narmada award, announced in September, which would submerge vast tracts of cultivable land in the region.

The Janata regime's biggest achievement has been that it has survived by adopting the policy of what one might call 'Unity in Adversity'. At times it seemed as if the party would split — at one stage, in the middle of the last year, the leader of the socialist wing, Raghu Thakur, even formed parallel organisations at district level — and the government would fall; but the sheer instinct of self-preservation helped it to pull on somehow.

Apart from a 33 per cent hike in the salaries and allowances of the MLAs, which would cost the state exchequer roughly eight lakh rupees annually, the only conspicuous achievement of the government has been the draconian ordinance putting a blanket ban on any form of agitation by any section of the population, reminding one of 1977's mini-MISA ordinance which was allowed to lapse after a public outcry against it.

On the other hand, even while the Harijan landless labourers were continued to be killed in the countryside in agrarian clashes the government has gone on with its gimmicks — like the ban on carrying of night-soil as head-loads by the scavengers — which flopped as soon as it was launched simply because the civic bodies failed to provide enough wheel-barrows to all the bhangis

China's Women: The Change and the Challenge

Govind S Kelkar

THE Communist Party of China has always regarded the emancipation of women as an integral part of the Chinese revolution. Women were considered "a decisive force" for victory of the revolution. At various stages of the revolutionary movement, the Party leadership expressed concern for women's liberation and for their participation in productive labour and socialist construction of the country. The Party's concern for women's liberation is reflected in some of the popular quotations of Chairman Mao:

> The day all women in China stand on their feet is the time for victory for the Chinese revolution.
> Times have changed, and today men and women are equal. Whatever men comrades can accomplish, women comrades can too.

I had informed the Chinese officials about my interest in the women's movement and had solicited their help in meeting the responsible members of Women's Federations in Peking, Shanghai and Canton.* Also, at the other places that I visited in China I had an opportunity to discuss the status and role of women with a cross-section of people, which included leading Party members, administrators, intellectuals, doctors, 'advanced' and model workers, as well as women and men from worker-peasant families.

There were two major themes that emerged from the discussions. The first one was related to the changed position of women in present Chinese society. The participation in socially productive labour was fundamental to women's emancipation in China. Only under the guidance of Chairman Mao Tsetung Thoughts, proletarian politics and the leadership of the Communist Party of China, women could liberate themselves. The other theme was a lack of political consciousness regarding the means to achieve the goals of a socialist society, a concept which in many cases advocated a unique 'female' position of women and suggested general constraints regarding women achieving full equality and socio-economic parity with men. In this note Chinese women, I have, therefore, called the two themes as 'the change and the challenge'. An attempt is made here to discuss how the Chinese women view their great progress in the revolutionary society, and the tasks that still require their protracted struggle in order to achieve complete liberation.

The emancipation of women started with the May 4 movement. In 1917 under the impact of the Soviet Revolution and with the practice of Marxism-Leninism, the women's movement began to grow. Under the leadership of the Communist Party of China, the women's movement gained momentum. Mao Tse-tung believed that the key to toppling the feudal, hierarchical system and Confucian ideology lay in the overthrow of the landlords who formed the backbone of all rural authority. Once the peasants succeeded in seizing power from the landlords, the other authoritarian-feudal systems would crumble. At the same time, the Party leadership felt that the special hardships suffered by women in the traditional social order of China provided them with great revolutionary potential. Mao said, "We should pay attention to the forces of women." The Chinese Communists began organising women's associations on their entry into the villages to be liberated.

In its drive for expansion and consolidation of the peasant movement, the Sixth National Congress of the Communist Party of China decided in 1928 to absorb peasant women into their revolutionary movement. Henceforth, one of the tasks of the Party was to bring masses of the peasant women under its influence. The party members and cadres helped women to organise themselves into associations. These women's associations were aimed at drawing women into both the revolutionary movement and productive activities, such as spinning, weaving, shoe-making, sewing, etc. The women's associations also took up the cases of maltreatment of wives by their husbands and in-laws. Women's associations met with strong resistance from men, but in time women's earning powers, gained through these associations, helped soften this resistance.

Women's position in the Communist controlled areas was further strengthened during the land reform when the land was redistributed to the individual, rather than only to the head of each household. For the first time in Chinese history, women legally possessed and controlled land. Later, the transformation in the ownership of productive forces which allowed female participation in productive labour and the Party policies were the key factors for the changed position of women.

In the early thirties, the Communist authorities in the Kiangsi Soviet system had legalised freedom of marriage and divorce. It is interesting to note that the Kuomintang Civil Code of 1931 had honoured the principle of equality between the sexes. The Kuomintang laws, however, did not penetrate the rural areas, where the deep-rooted customs and the feudal-patriarchical system were not to be changed by the decrees of a handful of urban intellectuals.

When the Party established its headquarters at Yenan, it had a commitment "to enhance the political consciousness and cultural level of its women members". Chairman Mao said that the revolution needed the support of women, who make up half of the nation's population. He encouraged women to assist the party in implementing its programme, to increase production and to seek improvement in the living conditions of women.

Women Revolutionaries and Women's Federation

The Chinese women's movement was begun by a group of women revolutionaries, among whom were Hsiang Ching-yu, a pioneer of the women's organisations, Yang Kai-hui, a close comrade-in-arms of Chairman Mao, Soong Ching-ling, Honorary President of the National Women's Federation, Tsai Chang, Chairman of the National Women's Federation, Teng Ying-chao, a Vice-Chairman of the Federation and Kang Ke-ching, a member of the Central Committee of the Communist Party of China and a Vice-Chairman of the National Women's Federation.

During our discussion in Peking, one of the federation members also referred to the story of Shanyana who took part in the revolutionary movement in the early twenties. When her daughter Hsia Chia-hsu (the present deputy minister) was five years old, Shanyana's husband died. Mother and daughter,

* The author visited China in April-May 1978. Some of her impressions of China were published in the *EPW* of December 2, 9, 16 and 23-30, 1978. The spellings of Chinese names in the article follow the old system of romanisation.

being women, did not have any rights to the property and were driven out of the village by the clan authorities. In spite of life being difficult Shanyana managed to send her daughter to school, and in 1921 she became a member of the Chinese Communist Party. Later both mother and daughter actively participated in the revolution.

To mobilise women, the Party set up a Women's Department and Hsiang Ching-yu was the first to head this department. She worked in France on a part-time study and work programme and returned to China in 1922 when she worked for the revolutionary cause and made great contributions. She called on women intellectuals to "go among the women workers and peasants, work for them and learn from them". She wrote a number of articles on women, emphasising the importance of their role in society. She said that the women's movement could be linked with the movement for the power to the proletariat. "Women's rights are not something to be begged for, not something to be given to us in charity by the ruling classes. They are the prize of the struggle we must seize back from the ruling classes." In 1928 Hsiang Ching-yu was arrested by the enemy and sentenced to death by the Kuomintang.

Later at Hsiang Ching-yu's suggestion, the Party organised women's associations in different parts of the country with worker-peasant women as the core force. For instance, in the liberated areas in the Yenan period, nearly 10 per cent of women were organised into various women's associations. In 1937, in the Shensi-Kansu-Ninghsia Border Region, the first All-Border Region Congress of Women, which was convened under the sponsorship of the Congress for Peasant Women, represented 30 mass organisations with a memership of 200,000 women from poor and middle-peasant families. Circulars were sent to these women's organisations in the Border Region in August by the Congress, requesting them to send delegates to participate in the preparatory work to establish a Border Region federation for women. The main purpose of such organisations was to reorganise women from all walks of life in the entire Border Region for the united front policy, and to participate in the War of Resistance against Japan, as well as to seek improvement in women's living. After six months of preparatory work, the Border Region Women's Federation was formally set up on International Women's Day (March 8), 1938.

The membership of the federation was open to women 18 years of age and older who maintained an anti-Japanese attitude and agreed to abide by the federation rules. The organisation of the federation was based on the principle of democratic centralism and a hierarchical structure along regional, county, district, township and village lines. The Border Region Congress of representatives was the highest organ of authority of the women's federation. During the recess of the congress, all the work and responsibility of the federation was placed under the leadership of executive committee. The executive committee was elected by the congress, as in other mass organisations. Under the executive committee there was a secretariat and three departments: organisation, propaganda and education, and wartime work. The three-member inspection team regularly visited the local women's federations to investigate their general progress and to provide them with guidelines for future work.

The First National Congress of Chinese Women in the early 1949 in Peking founded the All China Democratic Women's Federation. The Federation held congresses in 1949, 1953 and 1957. At the 1957 congress the name was changed to the National Women's Federation. The Fourth National Women's Congress was held in Peking from September 8 to 17, 1978. The Congress was attended by nearly 2,000 delegates from all over China.

Since 1949 women's federations have been set up at various levels in China, and their organisational structure is similar to that of the Yenan period. The national, provincial, county, and commune (or the Neighbourhood Committee in cities) divisions of the women's federation each has a congress of representatives and an executive committee. At the brigade level, there is the brigade congress of representatives of the women's federation, popularly known as the brigade section of women's affairs. During my visit to Shaoshan Production Brigade, I was told that in the brigade section of women's affairs, they discussed the following three aspects:

Political study: They received guidelines from the Party branch committee, and studied Mao's writings, sacrifices of his family and documents published in newspapers. Thrice a month, meetings were held in the evenings or sometimes in the afternoon. The current subjects were chosen for discussion, but emphasis was placed on ideological work. Meetings were held less frequently during sowing and harvesting seasons.

Production work: Work was distributed amongst the women in busy farming seasons. The women were encouraged to do ploughing and other heavy work such as carrying rice bags and fertilisers. They stressed Chairman Mao's policy on productive labour for women.

Family Planning: Nowadays after a woman has had two children, they persuaded her to go for family planning. (In the early sixties, this was done after she had had three children.) But some of the husbands (like in India), did not approve of their wives going in for family planning.

The Women's Federation in general works to encourage all its members to change their social and economic identity by leaving the confines of their homes to work in productive labour alongside men. They told me that the primary tasks of the Women's Federation centred on raising literacy and political consciousness among members; mobilising of women to support the Party leadership and its policies; increasing the participation of women in productive labour in order to increase production in general and to improve their social position; and protecting the rights of women.

Prior to 1949 there were 800 'joy houses' in Shanghai and 200 in Peking, in which several thousands of women served as prostitutes. The Women's Federation took up the cause of these socially handicapped women, and they were rehabilitated within a period of a few years. The Federation provided medical care and trained these women in productive work. These 'playthings' or prostitutes got back their dignity which they never had in the old feudal, oppressive society. The spread and persistence of prostitution in any country is due to socio-economic factors and it can be only eliminated by tackling these factors.

The Changed Position of Chinese Women since 1949

Since 1949, the role of women in the Chinese society has been completely changed. There are now women in all trades and professions; many are labour heroines oil-drillers, pilots, bridge-builders and high-tension power-line workers. The rights of women to social, political and economic equality with men have been formally proclaimed. The Party gives great encouragement to women to participate in socially productive labour and to make contributions to socialist revolution and national construction. Party propaganda materials have described many 'Iron Girls' teams who are engaged in unorthodox roles

in agriculture and industry. Of the 3,497 Deputies of the Fifth National People's Congress and the 1,510 delegates to the 11th National Congress of the Communist Party of China, women made up 21.2 to 19 per cent, respectively.

Women in today's China can be seen working side by side with men, and seemingly on an equal footing. Women's position in the present Chinese society appeared to me much better than in any part of South and South-East Asia, the United States and many other countries in the Western world. One finds them working in all walks of life, irrespective of day or night shift jobs. In Peking and Shanghai 90 per cent of the able-bodied women participate in productive labour. They have legal and political rights now. Unlike in the past, they also take part in the management of state affairs, more so at the grass-root level. For instance, in the Revolutionary Committees in all 18 districts of Peking, there are several women members including some holding leading positions. In the ministries of foreign affairs, light industry and communications, there are 12 leading women members including deputy ministers.

The emancipation of women had been greatly promoted by the enforcement of the Marriage Law of 1950, which guaranteed the equality of sexes in marriages and prohibited polygamy, concubinage, child betrothal and the exaction of money or gifts in connection with marriage. There is free mixing of boys and girls in today's Chinese society. One does not find anyone aware of his or her sex role in a work situation. Sexuality is not stressed in any form — dress, talks, jokes, advertisements, etc. This is their progress compared to their bound-feet mothers and grandmothers. The new generations of women, born and brought up in revolutionary China is not trained for house work alone or to play the exclusive roles of mothers and wives.

The fundamental reason for the improved position of Chinese women in the People's Republic is the change in ownership of productive forces. The system of state and collective ownership of productive forces gave employment opportunities to women. For example, today out of the 800,000 able-bodied women workers of Peking, 300,000 are employed in state-owned factories; 150,000 work in collective-owned factories; 150,000 work in the fields of education, sciences and technology, health care and physical culture; 120,000 are in the departmental stores and canteens; and the rest of women workers are organised as part-time workers in the factories run by the Neighbourhood Committees.

Women in China constitute 40 per cent of the labour force at the national level today. It was repeatedly emphasised during my discussions with the members of the Women's Federations at several places that the idea central to the women's liberation movement in China is that women are oppressed primarily because they are cut off from productive labour; in other words, women can gain liberation only through participation in productive work. The Party has repeatedly stressed that "women must stop looking on economic work as unimportant". In 1948 the Central Committee directives included, "In the first place women must not only be given equal economic rights and positions with men, and in the countryside get and keep an equal share of land and property, but above all they must be made to understand fully the importance of labour and must look on it as glorious".

Women's movement entered a new stage in China during the Great Leap Forward of 1958, when millions of housewives stepped out of their homes to work in the farms and industries run by the rural people's communes and the neighbourhood committees. For instance, in the year 1958, 60,000 women workers were recruited in Peking, out of which 4,800 were recruited in the handicraft industries to be run by neighbourhood committees. The women's federations throughout the country organised part-time and night schools to encourage women to educate themselves, realise their potential and take part in productive labour.

The Party and the government have shown great concern in freeing the Chinese women to participate in productive labour. The socialisation and modernisation of household chores is considered an important aspect of developing supportive work. There is a comprehensive range of supportive services such as public canteens, bakeries, laundries, tailoring shops, nurseries and kindergartens to reduce the burden in household chores and child care. In the factories, the trade unions have several women representatives who look after the interest of famale employees. Women workers are entitled to several kinds of leave, *viz*, (a) rest for two days and lighter work during menstruation; (b) from the 7th month of pregnancy working hours are reduced by one hour daily; (c) maternity leave of 56 days with full pay; in the case of a difficult delivery, the leave is extended to 70 days; (d) nursing mothers can take two to three 30-minute periods off to feed their babies during the working day; (e) during menopause, women are given light work and some rest periods (the last concern has been introduced recently and only in some factories).

Most factories have hospitals and day care centres. The factory hospital provides facilities for its women workers to undergo a free medical check up once a year, and family planning is propagated by the medical workers. Women can put their babies after 56 days upto one year in a day care centre run by the factory. After one year, they can put the babies in kindergartens. In Peking, there are 6,000 kindergarten schools with 280,000 children. (Before liberation, there were only 11 kindergartens with 300 children.) The bus run by the kindergarten picks up the child every Monday morning from the parents' home, and leaves the child back on Saturday in the evening. These are inexpensive facilities and cost only 50 to 70 cents per month. The other charges are subsidised by the factories or the organisations.

The retirement age for women industrial workers is 50; men retire at the age of 60 and intellectual and professional women (mental workers) when they reach 55. After retirement, they receive 70 to 85 per cent of their wages as pension. Workers and retired persons enjoy the same welfare facilities. They receive medical treatment free of charge and their family members are entitled to get semi-free health care facilities.

There are night schools for both men and women workers in the factories. Political study groups are held at regular intervals for ideological purposes. During these meetings they are also reminded of their 'bitter past' in the Confusian society and their improved status in the present society. Emancipation of women is connected with the liberation of the entire society. In the countryside, 'political night meetings' are organised generally two to three times in a month. The federation members referred to me the system in Tachai, "when men go to attend these meetings, women take care of the children and household work; when the women attend these meetings, it is the men who look after the children and household work".

All this signifies profound change in the position of women in China. The question is: Is women's liberation complete in China? One still finds many

manifestations of male prejudice, and surviving feudal influences on family life. For instance, women are expected to give more of their energies to problems of home and family. One also notices sexual division of jobs in the countryside and concentration of women in certain type of jobs, distribution of unequal work points for men and women and the failure to train women cadre in proper number. A systematic elimination of the Confucian, feudal remnants is the challenge before Chinese women.

CHALLENGE BEFORE CHINESE WOMEN

During my meetings with the leading members of Women's Federations in Peking, Shanghai and Canton, we also discussed the problems faced by women in China. I remarked that although Chinese women had achieved great success in all walks of life, yet they still had a long way to go to be on par with men. I gave two examples to stress my point: First, women earn less work points than men do; on an average 10 for men and 8 for women for a day's work. Secondly, women concentrate at the lower levels and only on certain types of jobs. Interestingly enough a great majority of the federation members agreed with my observations and even said "we have a long way to go in achieving social and economic parity with men". They explicitly pointed out the three major problem areas.

First, "women are excluded from heavy work in certain industries". But if machines could take care of the heavy work, then women would be treated equally with men. In the fields, men earned more work points because of their physical strength. But they hoped that with the development of science and technology and automation of heavy labour, men and women would be considered equal, and physical strength would not be considered the criterion for earning more work points.

The second problem was that housework was not being socialised and modernised enough. Although in the past the mass media have urged men to assist their wives with household chores, but it is only in the cities that men do share some housework. In the countryside, "men do not share any housework". To make housework easy and to enable women to devote more time to productive labour, it was necessary to have more supportive services, such as nurseries, kindergartens, schools, stores, public canteens and laundries and also use of machinery for household chores, particularly in the countryside.

The last of the problem areas was that the Women's Federation had to educate men and women to eliminate traditional influence, and develop self-confidence in women. They said, "We have a long history of feudal, imperialist rule. Women were lowest in the traditional society. Some of the traditional influences concerning women still continue." Thus there were historical reasons for insufficient representation of women in leading political and administrative organisations. Men have since ages secured training in all kinds of work, and women on the other hand did not feel confident enough to perform certain jobs. They emphatically pointed out the necessity for raising the scientific and cultural level of women, training skilled women workers and technicians who know how to operate modern equipment, women peasants who understand modern agricultural techniques, women managers who know how to run modern industry, and women designers, engineers as well as medical workers.

Women in China have already made a beginning in this direction. Women's Federation and women leading cadres organise political study groups in communes, factories and in neighbourhood committees to make housewives aware of the fact that they must take part in social productive work. In April-May 1978 when I was in China, 20 women in the Friendship Department Store in Peking had organised such study groups. In these study groups, they advocated that "taking part in social productive labour is a fundamental condition for women's liberation", they also criticised the remnants of Confucianism in society which considered men superior and women inferior. Another example was that of some women leading cadres who went to the communes to see that there were no unfair practices concerning women. In 1974 the Peking Women's Federation after a careful study and investigation protested against wage discrimination in Pingku County. Since then men and women have received equal work points there. Prior to their protest in 1974, men earned 10 work points for a day's work and women only 8 for doing the same labour.

It is significant that the whole socio-political context in China favours change in women's position and encourages struggle to destroy feudal ways of thinking and acting. The Party controlled mass media frequently launch mass campaigns attacking the old beliefs about women's inferiority and promoting women's participation in productive labour and distribution of equal pay for equal work. As long as there is recognition of these problems and the struggle against inequality and discrimination continues, there is no danger that these problems may become permanent features of the society.

This is only an announcement and not a prospectus

Ashok Leyland Limited

Incorporated on 7th September 1948, under the Indian Companies Act 1913
Registered office. Ennore, Madras 600 057

HISTORY OF THE COMPANY

The Company was incorporated in 1948 under the name of Ashok Motors Limited, which was subsequently changed to ASHOK LEYLAND LIMITED, to assemble manufacture and trade in motor cars motor buses and trucks diesel engines and all kinds of motor vehicles, their parts components and accessories

The Company obtained a certificate of commencement of business on 14th December 1948 and has been carrying on business since then Initially, the Company was engaged in assembling Austin cars and trucks In 1950 the assembly of Leyland commercial vehicles was added to its activities Steady progress was made in the volume of production and Ashok Motors Limited became recognised throughout India as one of the pioneers of a new industry

The name of the Company was changed to Ashok Leyland Limited on 4th July 1955 and a fresh certificate of incorporation was issued by the Registrar of Companies Tamil Nadu Madras

British Leyland International Holdings Limited, U K a member of the British Leyland Group of companies holds 59 57% of the total paid-up capital of this Company The British Leyland Group are manufacturers of trucks and buses known the world over for their quality besides being manufacturers of the well known Austin Morris, Jaguar, Rover and Triumph range of passenger cars and a variety of otheir products such as earth-moving and other specialised equipments,

OPERATIONS OF THE COMPANY

The Company is one of the leading manufacturers of commercial vehicles in the country From modest beginnings in 1948 as an assembly plant for Austin cars and trucks, the Company has grown in stature, having benefitted from it s collaboration with British Leyland and presently offers a variety of haulage and transport vehicles heavy-duty dumpers tippers, and tractors for off-the road and highway applications and industrial and marine engines

The Company, is the only manufacturer in India of Double Deck buses and of heavy vehicles like the Hippo and Beaver which are used mainly by the Defence Authorities The medium duty range of commercial vehicles includes the Viking and Cheetah version for passenger applications and the Comet and Tusker versions for the haulage applications The 100,000th vehicle produced by the Company was recently handed over to one of the Company's important clients

LOCATION

The Company has a modern, well-equipped factory at Ennore about 15 kms from Madras

TERMS OF ISSUE

The Equity Shares now being issued are subject to the terms of the Prospectus Application Form and the Memorandum and Articles of Association of the Company and the shares now being issued shall not be entitled to participate in any dividend that may be declared in respect of any period prior to 1st January 1979 They shall be entitled to participate in all dividends that may be declared after their respective allotments in respect of any period or periods from and after 1st January 1979 pari passu with the existing shares in proportion to the capital paid up thereon on the last day of the year of account in respect of which such dividend is declared irrespective of the dates when the shares were allotted or became so paid [illegible] interim dividends on the close of the last day of the period for which such dividend is declared irrespective of the dates when the shares were allotted or became so paid up and not with standing that the shares may have been allotted and [illegible] so paid up for only a part of the period for which such dividend or interim dividend is declared and in every other respect the said shares will rank pari passu with the existing Equity Shares.

PROSPECTUS AND FORM OF APPLICATION

Copies of the Prospectus and Application Forms may be obtained from the Registered Office of the Company Principal Broker, the Brokers to the Issue, Managers to the Issue, Registrars to the Issue and the Bankers to the Issue named herein or from any of the offices of the Bankers to the Issue mentioned against their names in the Application Form.

TERMS OF PAYMENT

On application Rs 4 per share and on allotment Rs 4 per share consisting in each case payment of Rs 2 50 on capital account and Rs. 1.50 on premium account

Cheques or bank drafts should be crossed " A/c Payee only" and made payable to any of the Bankers to the Issue with whom the application is lodged and should bear the words "A/c Ashok Leyland Equity Issue (For example " Bank A/c Ashok Leyland Equity Issue"). A separate cheque or bank draft must accompany each Application Form

FROM AMERICA

Making Good the 'Losses'

M Arun Kumar

IT would be naive to believe that the much applauded establishment of diplomatic relations between the United States and China will necessarily herald peace on earth and goodwill among men. Instead, viewing the decision in the context of the emerging geopolitics of the Middle and Far East, the portents are for a new era of contentious economic and perhaps military imperialism in the region.

That the domino theory is alive and well is evidenced by President Carter's decision to move a US naval task force to the Persian Gulf. The US still sees itself as 'winning' or 'losing' nations. The recent perceived 'losses' have been Afghanistan, Ethiopia, Somalia and Southern Yemen. The impending "loss" of Iran will unnerve Saudi Arabia, an important ally. Zbigniew Brzezinski has referred to an "arc of crisis" that stretches "along the shores of the Indian Ocean, with fragile social and political structures in a region of vital importance to us, threatened with fragmentation. The resulting political chaos could well be filled by elements hostile to our values and sympathetic to our adversaries". Brzezinski's predecessor, Henry Kissinger speaks much the same language when he criticises the Carter Administration's human rights campaign on the grounds that it tends to undermine "the domestic structures" of the US allies. Kissinger has advocated a stronger pro-Shah line, suggesting that the US should have helped the Shah crush the opposition.

Now that the Shah has left Iran on a 'holiday' and is unlikely to return, the US will have to move quickly to restore the "balance of power" in the region. Speculation is rife as to its options.

The first hope in Washington is probably that an Israel-Egypt peace agreement will leave both nations more securely tied to the US, and by moving the US aid apparatus into action, Egypt can be completely 'won', if this is not already the case. Egypt and Israel may then be delegated the responsibility for maintaining "stability" in the region. On the other hand, it is equally likely that Israel with its well-trained military apparatus has gained in importance for US stability, hence Israel may not be overtly pressured to make the vital concessions that Egypt and the Arab world insist on.

A second speculation is that the US will seek another 'pillar' of 'stability', and the role of this 'second pillar' may fall on Pakistan, which is seen to have both the skills and population to take over Iran's erstwhile 'security mission'.

A third suggestion is that India has emerged more significant in the region after the fall of Iran. The US should therefore establish a 'special relationship' with India to give it a larger 'security' role in the Indian Ocean. It is difficult to say whether China would like to have a populous neighbouring power coming anywhere near its own pre-eminence in the power line-up. In view of China's old affinities with Pakistan, it is likely that the US-China relationship would shift the locus of US emphasis towards Pakistan.

The Soviet Union's tangible reaction to the US-China equation has been to slow the SALT negotiations in Geneva. Tough talking from the US and China's sideswipes at "hegemony", combined with the Soviet Union's own involvement all the way from Southern Yemen to Afghanistan do not make the chances for tranquility any the greater

Indeed, the world over, the trend is towards increased military expenditure, beginning with President Carter raising the US military budget by $ 10 billion even as he is assailing inflation as enemy no 1 in the US.

* * *

The technical and student exchanges with the People's Republic of China have commenced, as well as of course the business deals. China's "great leap outward" and her "four modernisations" are widely publicised here. Deng Xiaoping has duly been dubbed "Man of the Year" by *Time* (which has been called the Administration's "cover-up of the year" in certain circles). How do the Chinese view the drastic shift from the cultural revolution to the "modernisations"? An articulate and well informed Chinese friend here explained it thus: if something is bent sharply in one direction, it must be bent equally sharply in the opposite direction to restore normality; the cultural revolution was necessary, and also necessarily extreme; now, the leap outward is necessary, but to make it successful, it has to again necessarily be equally extreme in the opposite direction.

An American businessman related the story of China placing an order with him for a rare mineral that is not available in the US. Since, despite his protestations that the mineral was unavailable in the US, they insisted on placing the order, he procured the mineral for them from South Africa, and proceeded to make arrangements for shipments to China. When he informed the Chinese of his plans, they sent him a telegram saying that "South Africa is a non-country and a mineral from a non-country will be non-productive" The puzzled businessman got in touch with the Chinese officials and pointed out that they had ignored his earlier protestations that the mineral was unavailable in the US, and so had forced him to procure it from South Africa The Chinese then replied, "Yes, we ignored you then, why don't you ignore us now"? Comment would be superflous

Financial Flows on Commercial Terms to Underdeveloped Countries

WHEREAS the volume of financial resources made available to underdeveloped countries has increased in recent years, the structure of flows has deteriorated in several regards. On the one hand, with Overseas Development Assistance (ODA) from all sources roughly stagnant in real terms, its share of the total has declined sharply. Associated with the shortage of ODA, low-income countries have growingly taken recourse to sources of non-concessional funds, with a corresponding deterioration of their debt structure that could compound their long-term difficulties. But although the low-income countries' share of total non-concessional borrowing by underdeveloped countries has increased, the bulk of such lending continues to flow to the middle-income countries, which are better placed to take up capital on market terms and service the new debt out of the additional production it makes possible. Reproduced below, with minor changes, is the section on 'Non-Concessional Financial Flows' from the 1978 Review of "Development Co-operation" published by the Organisation for Economic Co-operation and Development (OECD), Paris, in November 1978.

Non-concessional flows from Development Assistance Committee (DAC) countries* comprise essentially (a) export credits, (b) private investment, and (c) international bank lending. These flows provide a significant and increasing contribution to the external finance of developing countries, accounting in 1975-77 for close to two-thirds of the total net flows from all sources to "non-oil" developing countries compared with less than half in 1969-71.

Resource flows at non-concessional terms to non-oil developing countries rose by about $ 30 billion between 1959 and 1977 and were absorbed mainly by the middle and higher-income developing countries; the low-income countries, in view of their limited savings potential, cannot afford to service large amounts of commercial debt and have only restricted access to private capital.

Appraising the distribution of these transfers among the different income groups of developing countries requires careful interpretation because of a number of statistical difficulties: substantial amounts (over one-third) of private investment are not allocated geographically in the data and the figures for bank loans, in so far as they reflect trade related finance operations, may overlap with parts of what is recorded as export credits. Attempts are being made to improve the data base. At all events, comparisons must be made of the shares of allocated amounts received by the income groups. They are valid only in so far as the distribution of allocated amounts gives a reasonably accurate portrayal of the distribution of total amounts.

The main features of the aggregate statistics can be summarised as follows: Low-income countries, including Indonesia, received slightly over one-fifth of export credits and private investment in 1975-76, and only four per cent of bank loans in 1977. If Indonesia is omitted, they received only 9 per cent of export credits.

Middle-income countries, including Nigeria, for the same periods, received two-thirds of export credits and bank loans and more than half of private investment. The countries at the lower end of the income bracket were more successful in attracting export credits (36 per cent) whereas those at the upper end tended to absorb more private investment (38 per cent) and bank credits (41 per cent) but only 12 per cent of export credits.

Higher-income countries accounted for only a small portion of total export credits to developing countries (12 per cent), but roughly one-quarter of private investment and bank loans.

(a) Export Credits

Net officially extended or guaranteed export credits (with a maturity of one year or more) from DAC countries rose from $ 7.3 billion in 1976 to $ 10.8 billion in 1977 — an increase of 40 per cent. The amounts recorded in 1975-77 were in nominal terms more than 2.5 times the annual average in 1969-71. Major creditor countries were the United States, France, Germany, Italy and Japan, which were the sources of about two-thirds of the net flow of export credits in 1975-76. One-third of the new export credits reported had maturities between one and five years, two-thirds a maturity of more than five years.

Member countries' policies in the field of export credits have recently been reviewed by the OECD Group on Export Credits and Credit Guarantees with the aim of preventing the distortion of trade which may result from excessive competition in official support for export credits. The Group agreed on an "Arrangement on Guidelines for Officially Supported Export Credits" which came into effect on April 1, 1978. The guidelines are applicable to credits with a repayment term of two years or more. They restrict the maximum repayment period to the range of 5 to 10 years, depending on which income group the country of destination belongs to ("relatively rich": $ 3,000 per capita income or more; "intermediatory": between $ 1,000 and $ 3,000; "relatively poor": below $ 1,000). The guidelines also fix minimum interest rates between 7.25 and 8 per cent, depending again on the group in which the recipient country belongs.

From 1970 to 1976, developing countries increased their share of total export credits extended by DAC member countries from 60 to 66 per cent. Asian developing countries (including major OPEC countries) received roughly one-third. African and Latin American countries each about one-quarter of the total.

Eight countries, all of them industrialising rapidly [Indonesia, Philippines, Korea, Brazil, Mexico, Taiwan, Yugoslavia and Greece], accounted for over half of the export credits received by all non-oil developing countries. For this group, the average ratio between export credits and imports from OECD countries was 15 per cent in 1976. This is much higher than the ratio for all developing countries (11 per cent) and seems to indicate that there may be scope for increased import financing by means of export credits, even after due allowance is made for problems of creditworthiness and credit ceilings that set limits for some recipient counrites.

(b) Private Investment

The patterns of direct foreign investment in developing countries, i e, financial outlays for the establishment, expansion or acquisition of an enterprise with the intention of controlling it, have changed in recent years, especially in the oil sector. There has been a shift away from the traditional concept of full or majority ownership and control towards more flexible forms of co-operation, including agreements on joint ventures, production-sharing, management and licensing. These changes are not reflected adequately in the data available which thus are not a full measure of the implications of investment for production and productivity growth in the host country. Over the medium term, a rising trend of net direct investment flows can be discerned (average annual growth rate of 13 per cent between 1970 and 1976). The provisional data for 1977 indicate that this trend was maintained in that year.

More than one-third of allocated net direct investment flows in 1975-76 went to Latin America (40 per cent) and to Asia and Oceania (42 per cent). The shares for Africa (11 per cent) and Europe (7 per cent) were considerably smaller.

As regards the allocation of investments to income groups of "non-oil" host countries, recipients in higher income brackets obtain the bulk of foreign direct investment — a pattern which one would expect, given their investment opportunities and absorptive capacity. The major destinations in 1976, in order of magnitude, were Brazil, Indonesia, Bermuda, Bahamas, Zaire, Argentina, Netherlands, Antilles,

* The members of the DAC are Australia, Austria, Belgium, Canada, Denmark, Finland, France, Federal Republic of Germany, Italy, Japan, the Netherlands, New Zealand, Norway, Sweden, Switzerland, the UK, the US and the Commission of the European Economic Communities.

TABLE : FLOW OF FINANCIAL RESOURCES TO UNDERDEVELOPED COUNTRIES FROM DAC COUNTRIES

($ million)

Source : "Development Co-operation : 1978 Review", Organisation for Economic Co-operation and Development, Paris, November 1978.

Peru and the Philippines, which accounted for 56 per cent of allocated investment flows to all developing countries.

The stock of book values of foreign private direct investment in developing countries at the end of 1976 amounted to $ 76 billion, the main host countries being, in Europe : Spain and Greece; in Africa : Nigeria and Liberia; in Central America: Mexico, Bermuda and Panama; in South America : Brazil, Venezuela and Argentina; in Asia : Indonesia, Malaysia, India, Singapore, Hong Kong and the Philippines. These countries account for roughly two-thirds of the total investment stock.

(c) International Lending : Bond Issues and Bank Lending

Developing countries have increasingly tapped private capital markets. On balance, in recent years, funds have been abundant, and competition among lenders has resulted in a marked tendency to lengthening maturities. Interest rates, of course, vary according to the currency in which a loan is denominated.

(i) Bond issues

Most developing countries have been unable to place public issues, either because of their poor credit standing as perceived by the lending public or because of their lack of experience and skills in tapping this market. Nevertheless, the number of developing countries (including OPEC members) making bond issues has grown : from 11 in 1971 to 22 in 1977. In 1976, issues placed by developing countries amounted to $ 2.3 billion, including $ 1.3 billion of international ('Euro') bonds and, in 1977, $ 4.4 billion (including $ 2.7 billion in 'Eurobonds'). Borrowers among the non-oil developing countries were mainly middle-income countries, the most active among them being Mexico, Brazil and the Philippines : their combined share was one-third in 1975, one-half in 1976 and nearly two-thirds in 1977. Countries from the higher income group also issued bonds for considerable amounts. The main borrowers here were Israel, Singapore and Spain, whose shares, however, declined over time : from about one-half of total issues in 1975, to one-third in 1976 and one-quarter in 1977.

(ii) International Bank Lending

Recent surveys by the Bank for International Settlements (BIS) have enabled the OECD Secretariat to make better estimates than any previously presented of the volume of net flows of medium and long-term bank lending in 1977, i e, loans extended by banks in DAC member countries and their branches in non-DAC financial centres to non-oil developing countries (other than 'international financial centres). The figures are based on changes in the dollar amount of debt due to private banks between December 1976 and December 1977, and are therefore subject to distortions arising from changes in exchange rates as between these two dates, affecting the comparability of the figures as between countries whose mix of currencies in their outstanding debt was significantly different.

Medium-term Euro-currency loans included in the overall banking statistics have played an ever-increasing role in providing financial resources to developing countries. From rather low levels in the early 1970s ($ 1 to 4 billion annually), new syndicated bank lending announced in published sources (the so-called 'tombstone' advertisements) jumped to over $ 9 billion in 1973 and 1974. For the following years the increases were even steeper : $ 12.7 billion in 1975, $ 17.3 billion in 1976 and $ 18.4 billion in 1977. This is, of course, only a portion of total bank lending, and there are no estimates of amortisation payments on this particular category of loans. Net disbursements of total bank lending to all developing countries (i e, the change in the total claims on these countries of the banking sector) amounted to $ 17.8 billion in 1977, of which $ 13.6 billion was borrowed by non-oil developing countries. One-quarter of the latter amount was absorbed by the group of lower middle-income countries and 41 per cent by countries in the upper middle-income group. The higher income group received 29 per cent and low-income countries only 4 per cent.

The patterns of distribution for previous years can only be assessed from the data on syndicated loans, and are therefore not comparable as to absolute amounts or, to the extent that terms and maturities have varied, structure. Nevertheless, these figures are indicative, and show middle-income countries accounting for over two-thirds of total announced loans in 1971-72 and 1975-76, similar to their share in the total net flow in 1977.

Supporting the continuing growth of this market are, on the supply side, the OPEC surplus funds (around $ 35

billion a year in 1975, 1976 and 1977, but probably declining to about $ 20 billion in 1978), a sizeable part of which is recycled by the private banking sector. With borrowing requirements by governments and industry in industrialised countries remaining at a relatively low level due to the sluggish recovery from recession, ample funds continue to be available. This liquidity has created a borrowers' market with a narrowing of "spreads" and a lengthening of maturities, but interest rates have been rising. The following average interest rates were recorded for six-month bank loans repayable in dollars :

		(per cent)
Dec	1976	5.4
Dec	1977	7.5
July	1978	9.0
Oct	1978	10.0

On the demand side, the market has been characterised by the continuing need of some developing countries to finance part of their balance-of-payments deficits and/or to restore their reserve holdings to more reasonable levels by borrowing from the private banking sector. As a result, developing countries' share in total syndicated bank lending has remained well over 50 per cent, and a growing number of developing countries have addressed the market for syndicated loans: 16 in 1971 and 54 in 1977.

As far as the distribution of international bank lending in 1977 among individual non-oil developing countries is concerned, the main borrowers were: in Latin America: Argentina, Brazil, Colombia and Mexico ($ 4.3 billion), in Europe: Greece, Spain and Yugoslavia ($ 4.0 billion); in Asia: Korea (Rep) and Taiwan ($ 2.0 billion). In addition, several OPEC member states were among the most active borrowers in 1977, in particular Algeria, Ecuador, Iran United Arab Emirates and Venezuela

THE FOURTH ESTATE

The Prime Minister and the Press

Nireekshak

THE tone and tenor of the Prime Minister's response to questions from the Press make one wonder whether any purpose at all is served by these official press conferences. One has only to go through the transcripts of his press conferences to discover the abrasive tone, a wierd defensive mechanism that verges on the aggressive while answering questions.

In Nehru's days, the monthly press conference was an institution even if Parliament's zealousness about its position inhibited him from answering questions on policy matters when Parliament was in session. The institution was moribund in the 18 months Lal Bahadur Shastri was in office. Indira Gandhi tried to revive it but without much success because she had nothing much to say. What began as a regular monthly feature became irregular and soon a point came when she had no need to communicate anything through the Press.

Morarji Desai began well, offering to meet the Press as often as it wanted to meet him. But after a few encounters, it has been increasingly turning out to be a barren exercise. Reticence and caution on the part of the Prime Minister is understandable, but not the built-in hostility. Morarji Desai's response to questions in Madras on (January 19) the issue of Pondicherry and Hindi highlights this built-in hostility to the Press. He rebuked reporters for no less than (What he considered) actual advocacy of the cause of the anti-mergerists in Pondicherry: "Are you interested in the service of the country? If so, help the government". On Hindi: "Is this the only way you can survive here"? Most of his answers were counter-questions or insinuations at reporters. When a reporter pointed out that he was prejudiced against the Press, he snapped back: "If I am prejudiced against you, will I meet you? Are you trying to blackmail me?"

His New Delhi press conference the following day was by comparison a tame affair but it was a precious 60 minutes of time wasted; for not only did it yield little copy, but it also exposed the limitations of the New Delhi Press Corps. Given the Prime Minister's apparent belief that the Press is the cause of much of the 'crisis' in the Janata party and government, the interlocutors could have really confronted Morarji Desai on this issue.

As in the past, it was a free for all. The attempt by the Principal Information Officer to regulate the proceedings by limiting discussion during the 60 minutes available to a few agreed subjects was not liked by the Prime Minister who seemed to suggest that anything could be discussed by anyone in any order. Not surprisingly, there was no focus at all to the press conference.

The New Delhi Press Corps is a disorganised lot. There is no one to speak for it. After Morarji Desai became the Prime Minister there was a feeble attempt at instilling order into his press conferences through a moderator. It was earnestly suggested that the head of the Press Association of India (which claims to represent all the accredited correspondents in New Delhi but is in reality a real estate agency concerning itself with subsidised government housing for its members) be the moderator. As a pro-government outfit the Press Association has little credibility and in any case does not represent all the accredited correspondents. It was later suggested that the Principal Information Officer (who heads the Press Information Bureau) should moderate the proceedings, but the Prime Minister thought it would not be a wholesome practice for an official to undertake such a role because government might be laying itself open to the charge of doctoring questions as part of a newsmanagement game.

So the chaos at the Prime Minister's press conferences continues. It should not be difficult to pin the Prime Minister down on questions if the questions are precisely formulated and backed by adequate home work. Correspondents who have never filed a story show up at the Prime Minister's press conferences to be noticed by officials and to be seen on the TV screen and ask vague, pointless questions on eradication of poverty and illiteracy. At his latest press conference in New Delhi, the Prime Minister must have found to his surprise that the Press Corps is very poorly informed on the question of nuclear non-proliferation and in turn purveys its poor and misleading understanding to its readers.

A press conference could be a productive exercise with a reticent and even somewhat unfriendly Prime Minister if the correspondents take their jobs seriously. Thus, the New Delhi press conference yielded some useful points of information when the questions were pointed and had substance — like those on Kampuchea and nuclear non-proliferation.

A question to counter a question might be an accepted method of debate but the Press wants information; and if the Prime Minister has nothing to communicate it is well that the practice of formal press conference where issues as wide-ranging as auto-urine therapy and prohibition and nuclear proliferation and disarmament are discussed without any focus are discontinued.

South Asian Migrants

W H McLeod

The Banyan Tree: Overseas Emigrants from India, Pakistan and Bangladesh by Hugh Tinker; Oxford University Press, 1977; pp x + 204, Rs 75.

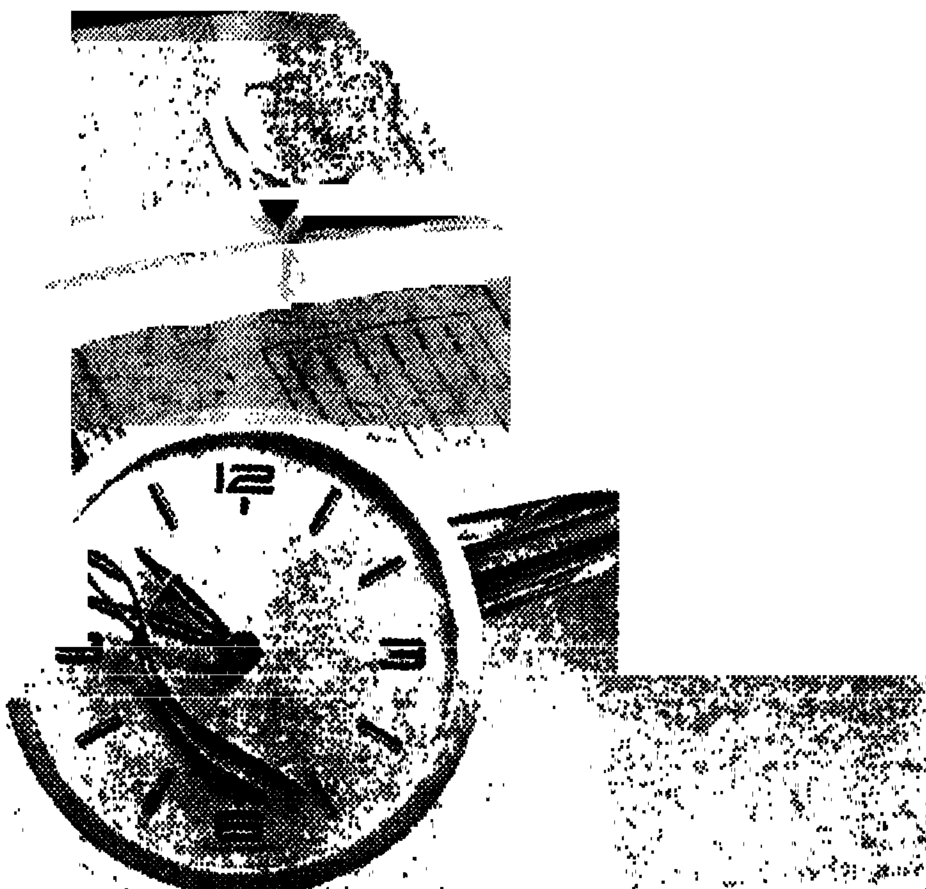
Between Two Cultures: Migrants and Minorities in Britain edited by James L. Watson; Basil Blackwell, 1977; pp 338, price not stated.

UNCHARITABLE critics sometimes refer to the United Kingdom's 'race relations industry'. It is to be hoped that these critics will show more indulgence towards the emergent industry developing in academic circles as historians and sociologists become increasingly aware of the importance of South Asian communities in countries outside the subcontinent. The interest is a welcome one and it will become all the more valuable if it can stimulate a following within the South Asian countries from which the various migrant groups have gone. Both books discussed in this review contribute usefully to this growth and as such deserve more than a passing notice in India.

Hugh Tinker enjoys unique advantages as a contributor to the new industry. Prior to the resumption of his academic career (he is now Professor of Politics at the University of Lancaster in England) he was for several years Director of the Institute of Race Relations in London, a period which has already produced "A New System of Slavery: The Export of Indian Labour Overseas, 1830-1920". In "The Banyan Tree" he offers a more general coverage of the entire subject, dealing with 'free' as well as indentured migration and bringing the account very close to the present day. Essentially the approach is historical. Into his treatment of the historical development of South Asian migration, however, he meshes extensive comment on the immigrant societies which have emerged in various parts of the world, laying particular stress on the widely divergent prospects which now face these different groups.

The book's introductory chapter provides a general setting for a series of regional treatments. Following a very brief sketch of early pre-colonial Indian migration movements he deals in turn with indenture, various 'free' movements (including the modern 'professionals'), actual numbers, religious affiliation, language, class, and political influence. All of these topics are covered very quickly and it is important to remember that their purpose is strictly introductory. The substance comes later. Even here, however, one encounters points of fundamental importance. One which certainly deserves to be grasped by the more ill-informed of his readers in the various 'host' countries is his passing reference to the constituency of the immigrant groups. "Externally, these communities are viewed as monolithic groups: 'the Indians', or 'the Asians', in much the same way as reference is made to 'the Jews'. In reality, these are solid communities only in the perception of the dominant population: among themselves they are separated and often fragmented" (p 13).

The substance of the book is provided by its five remaining chapters, each of them dealing with a particular form of settlement or resultant experience, and each covering the areas which illustrate the particular form or result. Chapter 2, "Permanently second-class citizens", traces the Indian experience in Sri Lanka, South Africa, and (very briefly) Rhodesia. "Independent — but still colonised" treats the sugar-producing areas, concentrating on those where Indians now constitute an absolute (if diverse) majority. These are Guyana, Mauritius, and Fiji. Chapter 4, "An auxiliary minority", covers Malaysia and Kenya. If the emphasis on Kenya leaves one wondering about Uganda, the answer comes in chapter 5, "The departure signal". This chapter also includes Burma. Finally there is "The hope o integration", a treatment of the United Kingdom situation with a brief note on Indian migration to North America.



As the chapter headings imply, a certain sense of idealism and commitment informs the book as a whole, an attitude which is plainly and properly signalled in the book's preface. One should perhaps be critical of this approach, though to be honest I found it difficult to generate any such response. This may be because the viewpoint is so openly acknowledged, or perhaps because the author's sentiments seem so civilised and humane. The honest answer is probably that the reviewer found himself sharing the same ideals (or prejudices). Others will not share them and may therefore be inclined to take a less sympathetic view.

Regardless of his or her predilections the reader will find plenty of information packed into each of the five chapters covering the various regional concentrations of South Asian immigration. These are strongest when Hugh Tinker is on ground which he knows from direct personal experience, and when he sustains the regional organisation of his material. One section which I found particularly informative was his treatment of the Burma situation, a thoroughly readable account of an aspect which most readers (including the reviewer) will know only in the sketchiest of outlines. In contrast, the treatment of Fiji is somewhat disappointing. Hugh Tinker warns the reader in his preface that this may be the case, acknowledging that it is the one area which he has not actually visited. Even so, one is left with the feeling that Fiji would not have suffered quite so much had the standard regional treatment been consistently used in chapter 3 as elsewhere. The middle portion of the chapter does offer brief individual treatments of Guyana and Mauritius (and Jamaica), but the Fiji references are scattered through the chapter. The reader is left with a correspondingly disjointed impression, one which fails to bring out adequately the radical fears and uncertainties which currently afflict so many of the Indians in Fiji. This is a little difficult to understand, for the book as a whole is notable for its impressively coherent organisation and Hugh Tinker's earlier work convincingly demonstrates that he knows a great deal about Fiji.

This particular criticism points up the need to view the book as a whole rather than as a collection of disparate items. General surveys are invariably vulnerable to specialist interests, and nit-picking specialists can always find holes if they choose to focus their attention on this manner of approach. In my own case the corrections which I found myself wanting to make invariably came from either the South Pacific or the Sikh material, and generally concerned minor detail rather than broad interpretation. It could, for example, be pointed out that the first Sikh gurdwara in the United Kingdom was founded in 1908, not 1962 (p 180), and that the footnote dealing with Australia on page 195 is astray. But

Gujarat believes: After your project has been speeded by incentives, it should not be tied down by formalities

Gujarat offers: New practical incentives + speedy clearance of formalities

No Stamp Duty, practically no NOC (No Objection Certificate). Registration number—even in a day! Industries Offices vested with powers in Districts. Result? Immediate clearance of formalities.

Also, a one-point contact for all the Gujarat Corporations—INDEXTb (Industrial Extension Bureau). Yes, Gujarat does everything you need to kick-start your industry.

And now Gujarat offers you a new package of practical incentives: Cash Subsidies upto Rs. 25 lakhs. Total Sales Tax Exemptions on purchases, Interest-free Sales Tax Loans upto Rs. 25 lakhs. Special Incentives for Project Reports/Feasibility Studies upto 80% of the cost.

All this makes it so easy for you now to convert your project plan into an industry.

GIDC **Gujarat Industrial Development Corporation** offers industrial land, sheds and infrastructural facilities at 81 locations.

GSFC **Gujarat State Financial Corporation** offers liberal financial assistance upto Rs. 30 lakhs under its various schemes, including foreign exchange loans.

GIIC **Gujarat Industrial Investment Corporation Ltd.** fills the investment gap when your needs exceed Rs. 30 lakhs, by providing term loans upto another Rs. 30 lakhs, equity participation/guarantee/underwriting.

GSIC **Gujarat Small Industries Corporation Ltd.** gives raw material and developmental assistance to small industries.

"The wheels that gear industrial growth in Gujarat"

this is unfair. General surveys are to be read as general surveys and not as compendiums of specialised monographs.

Who should read this book? The author himself expresses a preference: "It is hoped that this book will serve to introduce the people, originally from South Asia, settled in one part of the world to their brothers in another part... But my main purpose is to get British people of all kinds to consider what it is like to be a British or Commonwealth citizen when one's father came from South Asia" (p x). Although we may certainly hope that it will secure a following amongst both audiences I am inclined to the opinion that its greatest utility might well be served in home countries of South Asia, particularly in India. South Asian migrants to the United Kingdom are recent and articulate, and contacts with their home areas are well maintained. As a result one does not get the impression that the immigrant situation in the United Kingdom is by any means unknown in this country — at least not in Punjab! The same might also be said of East Africa, partly for the same reasons and partly because of Idi Amin. Name any other area, however, and it is most unlikely that one will encounter either *interest or understanding. This, surely,* is unfortunate and for those who agree "The Banyan Tree" will provide a ready remedy. It is to be hoped that the book will be widely read in this country, by general readers as well as those involved in the academic industry.

"Between Two Cultures" is explicitly intended for British readers and the book as a whole will obviously find its principal market in the United Kingdom. James L Watson of the School of Oriental and African Studies, London, has brought together a collection of papers by a group of social anthropologists, each of them dealing with a particular immigrant society in the United Kingdom. The contributions include, as one would expect, studies of South Asian and West Indian groups. They also include West Africans, Chinese, Poles, Italians, Greek Cypriots and Turkish Cypriots.

In his introduction the editor stresses the importance of taking European ethnic groups into account when dealing with the total British situation. This can be easily appreciated and one has little difficulty in accepting the claim that their inclusion serves a useful comparative purpose. Each of the contributions is nevertheless a self-contained unit which may be read without necessary reference to its companions, and readers with particular regional interests may well prefer to concentrate on the chapter or chapters which match this interest. Three portions of the book should attract the attention of readers in India. The first is the editor's useful introduction; the second is a paper on the Sikhs; and the third one on the Pakistanis from Mirpur district.

In his introduction James Watson describes the general approach adopted by his colleagues, stressing that all have had the opportunity of conducting their research from both ends of the migration chain. As he quite rightly indicates, research which is limited to the British end is doomed to serious distortion. The dual approach is unquestionably the sound one, provided of course that it is based upon a grasp of the home language and something more than a perfunctory experience of the home culture. Any work which enunciates this as an axiom is indeed to be welcomed.

Watson's introduction, however, does more than merely explain the intention of the book and the terms of reference observed by its several contributors. It also raises some very pertinent questions, frankly acknowledging that several of these are not yet amenable to answers. One stands out with particular clarity. "Although their writings sometimes obscure this fact, social scientists have found it very difficult to explain the causes of migration movements" (p 6). The 'push-pull' model is, he acknowledges, simplistic and as such is altogether inadequate as a sufficient explanation. The problem is well illustrated by the Sikh case. As the authors of the Sikh paper point out, a substantial majority of the Sikh migrants have come from the Jullundur Doaba. One can narrow the regional base still further, for it is the eastern portion of Doaba which has provided the principal source of Punjabi emigrants to the United Kingdom and to other parts of the world. Once the chain is established the process can be easily followed, but as far as I am aware no one has yet explained why other parts of Punjab have lagged so far behind Doaba. The problem becomes all the more perplexing when one realises that the earliest emigration movements were much more widely spread in terms of regional origins. During the latter years of the nineteenth century and the early twentieth century Malwais seem to have been just as numerous as Doabis, and Majhails were by no means absent. Pressure on eastern Doaba land-holdings is doubtless a part of the answer, but it is difficult to accept it as a total explanation.

This, however, should not be construed as a criticism of the Sikh paper which is in fact an excellent piece of work. Its authors are Roger and Catherine Ballard of Leeds, and Leeds has evidently been the focus of their work at the British end. This, interestingly, has involved them in a predominantly Ramgarhia community and one of the many strengths of their contribution is a clear recognition of the importance of caste connections. They begin by postulating a four-phase pattern of development, commencing with the initial seaman and pedlar origins and proceeding through all-male and family phases to the present "move away from the most unsalubrious ghettoes and the emergence into adulthood of a British-educated, if not yet British-born, second generation" (p 22).

When the Ballards began their research in 1971 the community's development had reached the third of these phases (the inner-city family phase) and their emphasis is thus placed upon this period and its successor. The result is fascinating, both for the generalisations which they draw and for the details which they record in pursuit of their generalisations. The latter include the interesting emergence of a city exogamy in the British situation, and a comment on leadership which deserves to be noted by race relations workers in Britain. As they quite rightly indicate, the leadership accepted by the native British normally derives from the Westernised fringe and does not represent the community's effective leadership.

One problem of approach which is tentatively raised but then put aside concerns the validity of treating the Sikhs as a self-contained unit. For a study which concentrates upon migration during the last decade this is perhaps an acceptable procedure, particularly in a city with a predominance of Ramgarhias. For the earlier period, however, one may well ask whether the primary unit ought not to be 'Punjabi' rather than 'Sikh'. Migration to the South Pacific certainly took a representative slice of the eastern Doaba rural population (including many Chamars) and although the Sikh identity assumed a particular prominence within this movement the movement as a whole was not an exclusively Sikh affair. An absolute majority have been Jats and, as in their home villages, the question of identity has been anything but clear-cut for many of these Jat migrants. Was this not the case in the United Kingdom also? The authors' reference to Ramgarhia insistence on the outward symbols implies a contrast with the Jats and suggests that the United Kingdom

experience probably matches that of the South Pacific and western America.

But then the British experience may perhaps have been different and the authors' indication that few untouchables migrated to the United Kingdom (p 27) suggests that in one important respect the later period of the United Kingdom movement did mean important differences. In New Zealand the Chamars are the second-largest group of Punjabi migrants after the Jats and the situation has probably been the same in Australia and Fiji. Feelings of antagonism are still very much alive, in New Zealand and Fiji at least, and if such feelings are absent in the United Kingdom their absence provides one more justification for treating the Sikhs as the primary unit.

The subject is a fascinating one and (for this reviewer at least) the Ballards have done it abundant justice. We look forward to future contributions from this knowledgeable and perceptive couple. One last comment deserves to be noted before we leave them, one which has nothing to do with the Sikhs but which (understandably) they were evidently unable to resist. Although Sylhet District is an inland area of Bangladesh many Sylhetis became seamen and as such specialised as cooks. This tradition they have sustained in the United Kingdom, with the result that most 'Indian' restaurants in Britain are run by Sylhetis.

The qualities manifested by the Ballards are also evident in Verity Saifullah Khan's contribution, "The Pakistanis: Mirpuri Villagers at Home and in Bradford". As the author points out the Pakistani population of the United Kingdom is a hetergeneous one and she wisely concentrates on the segment which plainly she knows well. Mirpur district in the portion of Kashmir occupied by Pakistan is another inland area with a strong sea-going tradition. Pakistanis comprise 10 per cent of Bradford's total population of 300,000, and of this 30,000 between 60 and 70 per cent are Mirpuris. In terms of language and culture the Mirpuris are essentially Punjabi and thus provide a particularly interesting comparison with the Sikhs of the preceding chapter.

The Mirpuris are, of course, Muslims and this offers an obvious point of contrast with the Sikhs. Does it amount to a significant difference in the British situation? For the women it certainly does, for whereas the Sikh woman enjoys a measure of social freedom (including regular access to the community life of the gurdwara) the Muslim wife must perforce live a much more restricted life. This lends support to the choice of the Sikhs as a basic unit. On the other hand, there is much in Verity Saifullah Khan's contribution which will sound very familiar to the reader who has had experience of Punjabi society on the Indian side of the border. The presence of caste, the importance of the biradari, the use of one's earnings, attitudes to the home village and its expectations — these and other features indicate the extensive nature of the common Punjabi inheritance. The author explicitly accepts the Ballards' four-phase model, placing the Mirpuris in the third phase and thus some 10 or 15 years 'behind' the Sikhs. She properly stresses that their fourth-phase experience may differ from that of the Sikhs. These will [illegible]

One minor correction in the Mirpur essay concerns the origin of the word *vilayat* (the term used to denote Britain). It does not derive from 'Blighty'. The reverse is in fact the case, 'Blighty' being the British soldiers' corruption of the Arabic/Persian (and thus Urdu) *vilayat*. A more general criticism applies to both chapters and indeed to some other parts of the book as well. Maps can greatly aid a reader's understanding and a map of the area from Mirpur to the Sutlej would have been a welcome addition. These, however, are slight blemishes. The book as a whole, and specifically its two South Asia chapters, sets a very welcome precedent.

Customs Union for Indian Sub-Continent

Rajendra Kumar

Economic Co-operation in the Indian Sub-Continent: A Customs Union Approach by T K Jayaraman; Orient Longman Limited, New Delhi, 1978; pp 161, Rs 28.

IN view of the growing sense of disillusionment among the less developed countries (LDCs) with regard to gaining trade preferences in the markets of the rich countries, there has been *increasing discussion of the possibilities* of mutual trade preferences among LDCs themselves. T K Jayaraman's book is a study of the economic gains that could flow from a customs union formed by Bangladesh, India, Nepal, Pakistan and Sri Lanka.

Essentially a free trade theorist, Jayaraman recommends trade liberalisation for LDCs as a superior alternative to seeking trade concessions from the dominant industrial countries. At the same time, he cautions them about the hazards of a worldwide free trade position unless the initiative were taken by the dominant industrial countries. He asserts that regional free trade along with common external tariff, as a second best alternative, should significantly remove the LDCs' foreign trade distortions and promote efficient allocation of resources. Jayaraman also suggests that such arrangements should be supplimented by a payments union. As an incidental advantage, this would improve the LDCs' bargaining power *vis-a-vis* the rich industrial countries.

Jayaraman explores the prospects of India forming a customs union with its neighbouring countries. He has processed a mass of available data for the five LDCs forming the proposed customs union. Looking to the small extent of their trade among themselves and the composition of this trade, his ex-ante calculations of 'static' effects with the help of estimated tariff rates and import elasticities show that the proposition is of "an adverse nature", the unfavourable trade-diversion effects being stronger than the favourable trade-creation effects. All the same, it is pointed out that the customs union would become 'critical' in theory when the common external tariff is lowered substantially, if only from the viewpoint of Bangladesh, India and Pakistan. Even then, the gains of the customs union will be modest — just above 1 per cent of GNP for Bangladesh and Sri Lanka and below 1 per cent of GNP for India, Nepal and Pakistan.

The theoretical conditions justifying a customs union of LDCs are realised only when their entire peoples are exposed to economic development. At present half of them live in poverty, having very low levels of consumption. For their own domestic market depelopment, the LDCs must resort to a customs union approach if only for the sake of integrated economic development. Then only would the proportion of their trade among themselves start mounting.

India is often referred to as a subcontinent, a single country having large territory, diverse resources and vast market potential. We do not have to wait for the formation of a hypothetical customs union; India itself

especially at [illegible] ... that India must strive for the [illegible] lessons to be drawn from the application of the customs union theory is ... tion of its domestic market through integrated rapid development.

Financing of Education

A R Kamat

Optimum Utilisation of Educational Expenditure in Gujarat by D T Lakdawala and K R Shah; Sardar Patel Institute of Economic and Social Research, Monograph Series 5, Ahmedabad, 1978; pp 269, Rs 50.

FINANCING of education has been explored in India off and on by several authors, particularly for its all-India trends; unit costs, and individual and social returns to investment in education at different levels. Since most educational policies become operational at the state level, even now after the inclusion of education in the concurrent list three years ago, state-level inquiry is always useful both for a better understanding of the situation and for suggesting policy changes. The publication of this long-awaited monograph on the educational expenditure in Gujarat is therefore a welcome addition to the literature in this area, although the delay of eight years between the data base and publication of results may somewhat diminish its present value, the new 10+2+3 pattern makes a great deal of difference.

As mentioned in the preface, the objective of the study was to identify areas for better utilisation of resources by examining the three layers of decision-making units: government, educational institutions (universities, colleges and high schools) and students. The study has made an exhaustive analysis of educational expenditure of Gujarat government and the finances of three universities for the period 1960-61 to 1969-70, and unit institutional cost in colleges for the year 1968-69. It also deals with three other related topics, but not as exhaustively nor as systemtically, unit costs in high schools for 1969-70, estimation of the percentage of the drop-outs from the SSC-pass students, and a socio-economic study of university and college students in Ahmedabad.

The findings cannot be described as startling: (affiliating) universities and colleges (of general education) depend more on fees than on government grants, ancillary activities of the universities are only partially covered by fees, the per-pupil government grants are decreasing over years and there exists many colleges and high schools of rather small size and therefore not economically viable. Economic and optimum sizes for colleges and high schools, etc, are discussed and the corresponding recommendations for better utilisation of resources follow. These are presented in lucid prose of 116 pages and supported by tabular information of 164 pages. Even so, after reading the volume one feels that the study should have covered a larger ground, and its methodology could have been improved in several respects. Moreover, although there is reference to decision-making units in the objectives, there is no examination of the actual decision-making of these units, except *post-facto* through the statistical data.

As to the coverage, while the title suggests that the study will encompass the expenditure on education at all the three levels, it hardly touches primary education. In secondary education its only concern is unit institutional cost and related variables; it does not examine the resources position of high schools (nor of colleges for that matter). It is therefore not surprising that the authors have not defined (nor evolved a methodology for determining) a financially viable institution, and have relied in this respect on the norms suggested by the Education Commission (1964-66).

The concept of optimality is also fraught with conceptual difficulties in that it cannot be simply equated with the minimum unit cost, irrespective of other factors. For instance, although many institutions, senior in age and traditions, may cost somewhat more than the bare minimum they may be compensating for this not-too-large cost difference by providing more varied subject-combinations and a fuller cultural and community life. The authors have mentioned the first but not these other considerations and in general have not explored or illustrated them. Thus the U-curves of their distributions may lose much of their significance if the authors had scrutinised in greater detail the right arm of the curve for these other aspects. Incidentally, have they bothered to inquire why the school data on unit costs do not give U-curves? The moral seems to be that in cases like education while the cost-efficiency approach is certainly relevant the 'theory-of-the-firm approach' may not be very promising.

Another question worth investigating was the health of the sub-optimum institutions, as to how they manage to survive. What resources do they muster to meet the two ends? Are there liberal provisions in grant-in-aid code to assist such low-size colleges and high schools? Or do they survive by just cheating the teachers and other employees of their legitimate remuneration? Perhaps both, but there is no inkling of this in the present study.

This study could have profitably investigated the role of the EBC concessions (besides local political pressures) in starting and sustaining chronically sub-optimum institutions. The authors have also ignored that the EBC concessions in effect may have substantially enhanced the government grants per student which they have noted to have reduced over the period. The experience of some other states has been that the EBC concessions have been responsible for maintaining many sub-standard low-size colleges and high schools so rampant in administrative and financial malpractices, including bogus enrolment.

But perhaps most surprising is the fact that nowhere have the authors referred to the research and extension activities of the university. The university is not only a teaching and examining body but is also an intellectual and cultural centre which owes extension programmes to the general public. Even if extension may be financially of minor significance this is certainly not the case with research which is more or less an obligatory activity for the university teachers. A significant part of the expenditure on salaries, library, and other facilities is meant to serve this purpose of consolidation and expansion of the frontiers of knowledge. True, this raises the difficult problem of quantification but surely social science researchers belonging to university set-up cannot simply wish it away by not taking cognisance of it. If they had devised some imputation formula for this purpose, as the reviewer has done in his exercise on costing some 13 years ago,[1] the per student cost figure for university students would have better reflected the real situation.

There are also other procedural-cum-methodological shortcomings, many of them avoidable. We shall not dwell on the two 'sample' studies, as the

SSC drop-outs and socio-economic conditions of university and college students since they are essentially purposive *case studies* and therefore do not have a representative character. We allude to a few others briefly to illustrate. For obtaining a more valid estimate of the SSC drop-outs the fresh enrolment in the pre-university classes throughout the state could have been compared to the total SSC out-turn of the year. In presenting per-pupil income and expenditure, as in Tables III-F (p 145 onwards), figures which refer to different reference groups are lumped together to obtain totals. In considering the optimum size, and for other purposes, colleges in different disciplines are sometimes lumped together (Chapter IV and Tables IV-H and I). It is not realistic to include colleges of medicine and engineering with the rest or even in the general category of professional colleges where colleges of commerce and law are of an altogether different species, in many respects. It is felt that the study of colleges should have been more profitably confined to colleges of arts, science, commerce and law for more intensive investigation because they have many common characteristics and account for the overwhelming majority of college students.

The reviewer has gone into somewhat greater detail than usual because such State studies are welcome and need to be repeated, and also because some of the problems mentioned above were faced by him in his study on costing several years ago [2]

Notes

1 and 2 A R Kamat, "Unit Institutional Cost in Higher Education", *Artha Vijnana*, 1967, later incorporated in "Two Studies in Education", Gokhalle Institute Studies No 55, Pune, 1968.

Books in Brief

Coal Industry in India by A B Ghosh, Sultan Chand and Sons; pp xii+312, Rs 60.

SINCE the steep hike in the oil prices coal has regained its important place in the energy development. The book under review, which makes a historical analysis of development of coal industry in India, is a timely publication. It covers several aspects of development of coal industry — known coal reserves, development of the industry over time, production and consumption of coal, labour problems, prices, wages, profits and investments, distribution, trade, etc. Thus it provides a comprehensive account of the industry before 1947.

While exploitation of coal on modern lines began from the middle of the last century, its accelerated development began after the opening of the Jharia mining area in 1893. After 1893 there was a sudden spurt in coal mining, lasting till the first quarter of this century. For example, the number of joint stock coal companies rose from 18 in 1891-5 to 109 in 1905-10 and to 260 in 1921-5. The paid up capital also rose substantially during this period and so did the profits which enabled the declaration of dividends averaging between 42 and 60 per cent between 1906-25. The boom started thinning after 1925 and this trend continued till the late 1930s. While the boom conditions reappeared during the second World War because of rapid industrialisation and movement of railways, there was no matching growth of the coal industry as compared to the earlier boom period. For instance, coal output during this period fluctuated between 26 and 29 million tons and paid up capital of joint stock companies rose from Rs 100 crores to Rs 117 crores. It may be asked, when demand and prices of coal were continuously rising why did it fail to attract matching investment? Was it due to the fact that investment elsewhere yielded better return? Or was it due to the fact that it was getting progressively expensive to work on the known mines? Or was it that the Jharia coal mines did not hold the prospects for further investment as they did in the earlier part of the century? That there was scarcity of labour and there was insufficient availability of railway wagons, as pointed out by the author, would only provide a partial answer to the question. Another question that arises is the high dividends declared in the earlier part of the century leave enough funds for reinvestment and modernisation or had the industry *failed to build up adequate reserves*? These are pertinent questions and need further probing.

—V S Mahajan

The Case That Shook India by P Bhushan; Vikas Publishing Co, New Delhi 1978; pp 294, Rs 35.

POLITICAL relations in India have been deeply influenced by the dominance of a mutually dependant relationship between the Congress Party and the Nehru family which led the country to freedom. The Congress has provided the base from which the Nehrus have propagated the ideology of modernisation'. In turn the largely middle class interests (comprising of the indigenous industrialists, professionals and rich peasantry) which control the Congress have relied on the popularity and charisma of the Nehrus to remain in power. The continuation of this symbiotic relationship was threatened when Raj Narain successfully challenged the 1971 election of Indira Gandhi to Parliament. A crisis arose, and the leader and her party had to adopt an 'authoritarian' character to remain in power. The March 1977 elections have reduced the impact of the Congress/Nehru influence on the body politic.

This book focuses on the legal action initiated by Raj Narain and, to a lesser extent, on the environment in which his election petition was decided. In his book Prashant Bhushan explicitly rejects the use of any tools to analyse the situation; so his book is essentially a narrative. The author has done an impressive job of documenting the sequence of legal events. Since Indian courts of law do not record all the testimony presented, his verbatim records will prove to be an invaluable source for students of politics and legal history. Both students of law and the ordinary reader will have occasion to use the sections from statutes and judgments which he has included as appendices.

Unfortunately the flow of the narration is thwarted by the disjointed structure of the last half of the book and the insertion of sub-headings into each and every chapter. Inasmuch as Prashant Bhushan's father was Raj Narain's counsel, he had a ringside seat to the action. Other books have, however, pre-empted his disclosures.

The book does not examine the law from the perspective of a colonised people. In it one finds an unquestioning acceptance of the validity of imposing Western legal categories on a complex eastern society with its own peculiar history. We do not find any discussion about the relevance of British electoral processes and laws to the Indian political reality. The Rs 35,000 ceiling on expenses for parliamentary elections has been consistently violated by candidates of all parties and Prashant Bhushan recognises this fact. But he puts it aside, perhaps, because he is unwilling to move from the deficiencies of a particular judgment to a theory about the nature of the law itself.

—Saad A Saidullah

Integrated Strategies for Economic and Demographic Development

Asok Mitra

Proceeding on the hypothesis that intensified programmes of population control have to be necessarily accompanied by an improvement in the quality of the population, this paper makes an attempt to assess the present demographic and economic situation, specially in the underdeveloped countries.

The crucial issue for these countries in the 1980s is not primarily the rate of population growth, since fertility reductions can anyway not be achieved without an improvement in the demographic quality of the population. What is crucial is genuine land reform, creation of more employment, improvement in technology and productivity even in the most primitive low-yielding activities, and the ensuring of a minimum quality of life, especially reduction in the rates of infant mortality, maternal mortality and morbidity.

I

IT looks as though the 1980s will be the most difficult decade for the underdeveloped countries. The problems created by rapid population growth and tardy social and economic development will have reached their peak during this period in most of these countries. Even if the decline in the birth rate, triggered in the seventies, accelerates, the crisis will persist well into the first half of the nineties. Signs of abatement may appear no earlier than the very end of the twentieth century. But that too will depend on what processes are set in motion in the late seventies and 1980s in the social and political economy of the underdeveloped world.

The magnitude of the crisis is reflected in the outline of the demographic features of the underdeveloped countries as of 1977. (See Table.) The birth, death and infant mortality rates throw light on the distance that will have to be traversed before a particular region completes its demographic transition. The proportions of population under 15 years show what formidable tasks most regions will have to face in the next decade not only in securing the health and education of its child and young population but in providing training and jobs to ever larger numbers of new and young entrants in the labour force.

All regions in this Table, except Middle South Asia, South East Asia, The Caribbean and Tropical South America, have birth rates of 40 per thousand population or more. Even among these four regions, as many as seven countries out of nine in Middle South Asia (the exceptions being India and Sri Lanka), five countries (Indonesia, Malaysia, The Philippines, Singapore and Thailand) out of ten in South East Asia, one (Dominican Republic) out of twelve in the Caribbean and five countries out of nine in Tropical South America (the exceptions being Brazil, Colombia, Guyana, Surinam and Venezuela) enjoy birth rates of 40 or more. Among the other seven regions of the underdeveloped world where the birth rate rules at 40 or more for the region as a whole, it is only Egypt and Tunisia in Northern Africa, Cape Verde in Western Africa, Mauritius, Reunion and Seychelles in Eastern Africa, Equatorial Guinea and Gabon in Middle Africa, Lesotho in Southern Africa, Cyprus, Israel, and Turkey in South West Asia, and Costa Rica and Panama in Middle America that enjoy birth rates below 40 per 1,000 population.

As for the death rate, it is only Libya in Northern Africa, Cape Verde in Western Africa, Mauritius, Reunion and Seychelles in Eastern Africa, Bahrein, Cyprus, Israel and Lebanon in South West Asia, Sri Lanka in Middle South Asia, Malaysia, the Philippines and Singapore in South East Asia, Costa Rica, El Salvador Mexico and Panama in Middle America, all countries except the Dominican Republic and Haiti in the Caribbean, and all countries except Ecuador and Peru in Tropical South America that enjoy death rates below 10 per 1,000 population according to the UN statistical compilations. These official death rates are however open to doubt when one recalls the official death rates in countries with infant mortality rates ranging between 8 and 33 per thousand live born, like Denmark, Norway, Sweden, United Kingdom, Austria, Belgium, France, Federal Republic of Germany, Luxembourg, Czechoslovakia, German Democratic Republic and Hungary were 10 or more for the years 1974/75.

More than the crude birth rate, the underdeveloped world still faces an uphill task over the infant mortality rate (IMR) which is a better indicator than many other demographic ones of the level of living. It is more difficult to reduce IMR than the general death rate, the process depending more on a general improvement in education, social change, housing and economic activities. Of all the regions listed in the Table only the Middle and Tropical South Americas and the Caribbean enjoy IMRs less than 85 while all other regions still suffer from IMRs above 100, Western Africa consisting of 16 countries suffering from a rate as high as 175.

The 'dependency ratio' for each region can be derived by adding the percentages under 15 years and over 64 years and dividing by the complement. The number of persons in the 'dependent ages' for each 100 persons in the 'working ages of 15 to 65' in the 11 regions ranges from 78 to as much as 92. Since the proportion of population under 15 will continue to rule high at least up to 1980 the dependency ratio will reach an all-time peak in the 1980s, while the proportion and absolute numbers of entrants to the labour force will reach an all-time record during the same decade.

Life expectancy at birth, except in North Africa, South West Asia and the three Latin American regions is still generally below 52. The countries that have exceeded this level in the remaining six regions are Mauritius (63), Reunion (63), Sevchelles (65), Sao Tome and Principe (53), Bahrein (78), Iraq (64), Israel (82), Kuwait (56), Lebanon

TABLE : DEMOGRAPHIC DATA OF UNDERDEVELOPED COUNTRIES BY BROAD REGIONS, 1977

Region	Population Estimate Mid-1977 (millions)	Birth Rate (1970-75)	Death Rate (1970-75)	Rate of Natural Increase (annual, per cent)	Number of Years to Double Population	Infant Mortality Rate	Population under 15 Years (per cent)	Population over 64 Years (per cent)	Life Expectancy at Birth (years)	Urban Population (per cent)	Per Capita Gross National Product (US $)	Population Projection to 2000 (millions)
	1	2	3	4	5	6	7	8	9	10	11	12
1 Northern Africa (6 Countries)	100	42	14	2.8	25	180	44	3	53	39	570	185
2 Western Africa (16 Countries)	125	49	23	2.6	27	175	45	3	42	19	300	243
3 Eastern Africa (16 Countries)	120	46	19	2.7	26	151	44	3	45	12	220	239
4 Middle Africa (9 Countries)	48	44	22	2.3	30	165	43	3	42	24	270	88
5 Southern Africa (5 Countries)	30	40	16	2.5	28	119	41	4	51	44	1220	57
6 South West Asia (16 Countries)	89	42	14	2.8	25	114	44	4	55	44	1370	166
7 Middle South Asia (9 Countries)	864	37	14	2.3	30	125	41	3	49	20	200	1473
8 South East Asia (10 Countries)	332	38	14	2.4	29	116	43	3	52	21	260	574
9 Middle America (7 Countries)	85	42	8	3.4	20	70	46	3	62	56	1060	174
10 Caribbean (12 Countries)	28	30	9	2.1	33	75	41	5	64	45	970	44
11 Tropical South America (9 Countries)	183	37	9	2.8	25	84	43	3	61	59	960	337
Total: 99 Countries												

Source: *1977 World Population Data Sheet* of the Population Reference Bureau, Inc Eleven regions have been selected. The East Asian Region (People's Republic of China, Hong Kong, Japan, the two Koreas, Macao, Mongolia and Taiwan), the Temperate South Americas (Argentina, Chile and Uruguay) and Oceania Regions (Australia, Fiji, New Zealand, Papua New Guinea, Western Samoa and Solomon Islands) have been left out.

(60), Qatar (69), Sri Lanka (68), Malaysia (63), Philippines (58), Singapore (68) and Thailand (58). Low life expectancy reduces the horizon of national and personal economic enterprise. As a result, the span of personal accumulation and improvement of skill and experience of investment in plant, machinery, capital and manpower in personal and group enterprise is still quite narrow. The scope of long-term planning in any type of personal or household economic enterprise is thus grievously constricted by low life expectancy in these regions. On the other hand, low life expectancy is responsible for chronic drain on the nation's skills, technical manpower, economic motivation, savings and capital accumulation.

The proportion of urban population except in the North African, South West Asian and the three Latin American regions is low. The number of countries in the remaining six regions comprising 81 countries that have an urban ratio more than 25 is 32. Of these 32 countries again only Zaire, South Africa, Iraq, Turkey, Iran, Pakistan and Malaysia have total populations exceeding 10 millions. Thus the majority of countries in the underdeveloped world with an urban ratio exceeding 25 are countries with small populations. The high urban ratio in them cannot always be taken as a high index of industrialisation of urban livelihood or of massive transfer from agricultural livelihoods to non-agricultural ones. The urban populations even among those which have higher urban ratios are usually concentrated in a handful of primate cities, mostly suffering from urban involution and proliferation of slums with preponderance of populations working in low wage and low value-adding industries, trade, commerce, construction, transportation and personal services. In short, almost all countries in the underdeveloped world are over-urbanised in the sense that much of the urban populations in them live in conditions that are not essentially industrialised in settings of minimum urban amenities answering to the urban norms of developed countries. In reality much of these urban populations, even if they live within areas demarcated as urban, suffer from the lack of an adequate non-agricultural, industrial base with attendant lack of true urban infrastructure.

Finally, most countries enumerated in the Table command no more than a fraction of the average per capita GNP of the world taken as a whole, which in 1974-75, was 1,530 in US dollars. Countries in the underdeveloped world that exceed the average are Libya (5,080), Reunion (1,550), Gabon (2,240), Bahrein (2,440), Israel (3,580), Kuwait (11,510), Oman (2,070), Qatar (8,320), Saudi Arabia (3,010), United Arab Emirates (10,480), Singapore (2,510), Martinique (1,540), Netherlands Antilles (1,590), Puerto Rico (2,300), Trinidad and Tobago (1,900) and Venezuela (2,200). These, excepting Israel which began its life with massive imports of foreign remittances, plant and machinery and above all skilled manpower, are either oil countries which have made good since October 1973, or countries which enjoy monopolies in certain types of natural or agricultural resources which give them favourable export earnings Their wealth is not yet quite equitably distributed among their populations Their earnings have not yet been properly invested in wealth producing industries or other forms of enterprise that might lead to a decided improvement in human resources translated in terms of levels of living, employment and productivity. Fifteen of these privileged countries, not counting Israel, account for a population of not more than 33.8 millions. They are in possession of the capital but have not yet acquired the capability of human enterprise properly to invest it.

There are 48 countries in the 11 regions with an aggregate population of 442 millions the per capita GNP of which ranges between 200-750 US dollars. There are countries in this category with (a) large natural resources but with populations that are too small for their full exploitation; (b) small areas and limited natural endowments but with a fair density of population which have achieved or are on their way of achieving worthwhile levels of living, economic and technological development and productivity but suffer

from the constraints of space and natural endowments; (c) large areas with considerable natural resources but which have not yet developed their human resources, technology and capital investment and are dependent for their GNP on export of raw materials or agricultural or plantation products of near monopoly character. The majority of these countries have a weak heavy and capital goods industry base, are still largely dependent on thier agricultural or plantation crops or extraction and export of unprocessed or semi-processed ores and minerals, the value-added component of which is small. They are compelled to undertake heavy defence expenditure as security against aggression, and are compelled to import technology, technical personnel and capital at a heavy price for developing their production base and human resources. Internally they tend to suffer from considerable regional imbalances and income inequalities, a narrow power base controlled by the elite which hinders democratic participation and extension of benefits. They tend to be dominated by finance and industrial capital of former imperial masters, or the operation of multinational cartels.

These remarks apply almost equally to the 18 countries which enjoy a per capita GNP of 750-1530. Of these 18 countries, two belong to Northern Africa, two to Southern Africa, three to South West Asia, one to Middle South Asia, three to Middle America, four to the Caribbean and three to Tropical South America. Their aggregate population comes to 310 millions. The most important countries in this group in the matter of population as well as area and natural resources are Brazil (population 112 millions), Mexico (64.4 millions), Iran (34.8 millions), South Africa (26.1 millions), Algeria (17.8 millions) and Peru (16.6 millions).

Finally, there are as many as 31 countries in the eleven regions with a total population of 1,190 millions which enjoy per capita GNP of less than 200 US dollars, in fact generally less than 150 US dollars (India with 620 millions with 150 US dollars), the lowest being as low as 70 US dollars. Quite a few of them are large, comparatively densely populated, countries with considerable natural resources neither fully explored nor exploited, with small capital and industrial bases but with considerable accumulation of experience and skill in traditional agriculture and industry in the informal sector.

Quite a number of countries in these eleven regions have built up wide-ranging, industrial bases of much sophistication and diversity with impressive industrial, transport and financial infrastructures and highly developed, human, scientific, technological and managerial resources. But they still suffer from glaring spatial imbalances and gross income inequalities. The small per capita GNP of these countries, particularly of the last group that we have discussed, leaves little scope for massive capital accumulation, even when the domestic savings rate is coaxed to touch as high a level as 20 per cent. Large inequalities in income distribution compel high reliance on indirect taxation which further impoverishes populations in the lower income deciles and inhibits consumption as well as expansion of production. Unemployment rates are high and help to build up an industrial reserve army to be governed by the 'iron law of wages'. National policies on productivity and distribution, expansion of capital goods industries and exploitation of natural resources are often made to subserve the interests of small groups rather than the nation. The basis of firm democratic, not to speak of socialist participation, and therefore of expansion of capital base, level of living, productivity, social and economic growth, remains weak. They are therefore prone to oligarchic and authoritarian rule, the ruling elite seeking legitimacy behind populist manifestos and face-saving elective procedures, upholding their own authoritarian devices while proclaiming them as true socialist or democratic norms suited to the particular genius of their people.

II

The above brief account describes the frame against which the World Population Conference was held at Bucharest in August 1974. It explains why different underdeveloped regions had their own perceptions of the interrelationship between demographic and economic development, while subscribing to the need for an overall New International Economic Order. Different regions reflected at Bucharest in different ways their views on the population problem — this, according as they perceived rapid population growth or the lack of it as hampering economic development. But there was unanimity on the need to reduce as fast as possible general mortality, infant mortality and morbidity, and improve life expectancy at birth as true and reliable indicators of a physical quality of life for providing the basis of improvement of human resources through education, health and medical care, upgrading of human skills, technology, employment and productivity. The general feeling was that while in the ultimate analysis there was no way out but for each country to help itself, rapid improvement would be facilitated by the coming together of rich and poor nations, transfer of resources through better terms of trade and transfer of technology and more equitable distribution of incomes, resources and knowledge among advanced and backward regions and peoples.

But all through the previous decades, the concern of the developed world had settled with such singlemindedness on the need to reduce as fast as possible the birth rates in the underdeveloped world as the best single key to development that it grew to be an *idee fixe* of the kind noted by Finkle and Crane.[1] The message of Bucharest 1974 was not heeded to the extent it deserved to be as was evident in the course of an 'Inter-regional Meeting of the Consultation Group' convened by UNFPA at Geneva in September 1975. Practically no underdeveloped country at Bucharest, except those whose development was suffering from lack of adequate manpower, refused to recognise the urgent need to reduce its rate of population growth as a necessary corollary to social and economic development. Most countries acknowledged the need to reduce the rate of population growth and achieve an NRR of 1 as rapidly as possible as an enduring guarantee of social and economic development, and for this purpose to step up investment in family planning while pushing ahead with economic and social development plans. Few insisted on any *either or* formulation. But what came after Bucharest was no more than a small and inadequate modified strategy from bilateral and multilateral aid givers. This was to recommend a more attractive packaging of family planning technology and services with nutrition, maternal and child health, intensive child development and cognate welfare programmes unrelated to programmes addressed to increasing wealth through employment, wages, working conditions, technological and other changes in the industrial and resource structure of countries or through accelerating productivity, consumption, capital formation, economic development and income distribution.

After Bucharest, bilateral and multilateral aid donors have been anxious to promote the packaged family planning approach more steadily than the integ-

rated development approach, although they realise that the former approach is liable to swell the consumption expenditure of poor countries to the detriment of their investment sector not only by committing more resources to this packaged programme but also by way of diverting more of trained and scarce manpower. The poor countries are deficient in both and face a genuine dilemma on the priorities of allocation of these resources. The rich countries cannot be entirely blamed for having found packaged welfare programmes the key to their own problems of productivity, capital formation and income distribution and, therefore, for pressing their own recipe on poor countries who have a different problem altogether. The insistence on the part of developed countries on the packaged family planning programme approach, dissociated in the main from programmes of capital formation, economic growth, employment, technology, productivity and income distribution, has not infrequently been welcomed by oligarchical, authoritarian elites in poor countries who perceive the menace to their own plans for growth and development as similarly coming from the rapid numerical growth of their own poor.

Despite this solidarity of approach between donor countries and the ruling elite of recipient countries, the successive UNCTAD and GATT Conferences, the North-South dialogues, trade and other economic negotiations between poor countries and rich countries, the virtual breakdown of the Law of the Sea Conference and other failures in the field of technology and resource transfers, equitable international division of labour, multinational collaboration, joint ventures, etc, demand rethinking on long term strategies for economic and demographic development in the underdeveloped world.

III

Contrary to what Malthus maintained, it is now generally conceded there can be no natural and universal law of population. Rather, population is determined by the social and economic conditions prevailing in different societies. Fertility is a function ultimately of social organisation. It depends on the way in which the means of production are owned and on the social relations between men which result from their connections with the process of production. It follows that any strategy for economic and demographic development in the 1980s especially for underdeveloped countries should have two complementary components: international and national. Both components will have to ensure that the element of value-added in any social or economic activity involving division of labour in international* and national transactions must continually appreciate at all levels — macro, meso and micro — and progressively reduce the value of future supplies of children at the level of the household, because it is at this level that their value is most prized. At every stage from the household upwards to the national level, mechanisms will have to be created to retain some part of the value added in any economic enterprise to enrich the successive populations engaged in them. Although a discussion of the international prerequisites for a successful strategy of national economic and demographic development is outside the scope of this paper, brief mention needs to be made of what is involved on that plane.

More than the debate on whether developed nations should put up one per cent or whatever of their GNP for international aid, it is imperative that they assist in large scale transfer of technology to the underdeveloped world on easy terms to enable them to develop and add to the value of their natural resources in the international market. This assistance in transfer of technology should not only apply to sophisticated sectors of capital goods production and processing of commodities for the international market to augment the national value-added component in international transactions. It should also be directed towards the development of intermediate technology — of which the developed nations are rich in skill and experience — which will enhance the production and value of primary and intermediate commodities at the village and district level and help generate and retain wealth in small areas for their reploughing. At the bottom of it all must rule the concept of the international just price for which underdeveloped countries singly and in groups have been vainly pleading and fighting in forums like the UNCTAD, GATT, ILO, North-South and Regional Conferences. Above all, the question of energy generation and distribution in all its forms cries out for a just solution.

Much of the success of the national strategies in the 1980s will depend on how international co-operation plans and the operation of multinational corporations take shape and where and how the gravy flows. But the signs have been unpropitious so far, exposing the double standards in the developed nations' concern over the population and development problems of underdeveloped countries. A recent illuminating case is the falling out of EEC and Hong Kong (which in some ways is the golden egg of trade of the EEC countries in the Far East) over textiles. The textile industry provides half the jobs and half the export revenue for two million Hong Kong workers. After 10 weeks of protracted and acrimonious negotiations with EEC representing some 200 million of the world's richer citizens, it was clear in the five-year textile export restraint agreement made public in December 1977 that the provisions of the convention regulating the international textile trade, the Multi-Fibres Arrangement (MFA) would be ignored and that MFA's guarantee of a six per cent annual minimum growth in all quotas would be a relic of less-protectionist days. In November the common market's special negotiator had accused Hong Kong of blocking progress in simultaneous EEC talks with 33 other Third World textile suppliers, and said that unless Hong Kong reached "a reasonable agreement", EEC would unilaterally cut its quota and switch some purchases to other countries. These unilateral cuts on the part of the richer nations have come to stay in the relations between rich and poor countries.

Most countries in the Third World would have suffered from direct imperialist rule or colonial exploitation in the past which still continues in disguised forms. The essence of imperialist or colonial rule was to drain out the natural resources of the country in bulk as much as possible in unprocessed form so that the value-added component in the originating colony or empire countries would be the least. In the execution of this task finance capital would be imported to enlist the support of the indigenous comprador classes who would be allies in the draining out process. Imperial administrations, including programmes for education, social welfare, development of infrastructure and the development of indigenous human resources were primarily employed for the benefit of the rulers and secondarily for nursing the small indigenous comprador class which would be willing to place itself at the service of the rulers. Freedom movements came when this draining out process began intolerably to hurt the comprador class itself, not to speak of the general mass of poor producers.

The success of liberation movements

was invariably accompanied by populist and 'socialist' professions of faith in most countries of the Third World. These were engendered by the realisation that the value-added elements in production must be generated and retained at as wide a level of spatial and population disaggregation as possible. This recognition was to rest for its success on two concurrent levels of organisation: political and economic. There were to be certain decisions and long term targets to be centrally planned and achieved, mainly for assisting the process of value-adding at the micro as well as the macro level. These would be centrally planned, capital and producer goods and a certain range of consumer goods industries, development of infrastructure, energy and water resources, the rate of domestic savings and capital formation and the like. But essentially the process of value-adding in economic and social production was to be encouraged at the micro level not only to generate the wherewithal of development at the lowest and intermediate levels but to ensure accumulation of capital and resources at the national level. This was not possible without very intimate intertwining of the political and productive processes at every level. This was at the bottom of Gandhi's philosophy which commanded the attention of the leaders of freedom movements of other countries.

This political and economic process has not developed according to expectations. The impediments, in short, have been national as well as international. The indigenous comprador class of imperialist regimes has in most countries transformed itself into a new elite, composed of an alliance of the large industrial and agricultural producers and the numerically small intelligentsia. The process of draining out of wealth by way of primary commodities and mineral resources from the countryside to the large urban centres for the benefit of small fractions of the population has been maintained. To this has been added the need to collaborate with the process of draining wealth out of the country in the name of export earnings to provide for plants, machinery, foreign technology and other imports which do not generally subserve the needs of the majority of the country's population. This has, in turn, assisted the evolution of mixed economies and political dualisms and widened the gap between political professions and economic performance. The value-adding process at the lower and inter-mediate levels are in danger of getting choked while the draining out process is sought to be buttressed by a variety of insidious as well as patent authoritarian developments that swear by democratic values and institutions.

The task of radical and massive improvements in levels of living, employment and productivity, human reproduction and longevity in the 1980s is not going to be easy. But it is not impossible. The fact that even the most authoritarian regimes in the Third World are compelled to have recourse to sugar-coating their anti-people policies with democratic and socialist protestations is evidence of the persistent groundswell of discontent which the regimes cannot afford to ignore and which may well in the course of the 1980s bring matters generally to a head.

Few underdeveloped countries listed in the Table will be able to afford in the next 20 years that level of massive investments in industry, urbanisation and modernisation of infrastructure, notably in energy, irrigation and agriculture, that will bring about spectacular transformations in the welfare and industrial structures of their populations. Apart from the fact that such transformations will be stoutly resisted through instruments like Institutional Act Fives or *Paquetes de Abril* by the entrenched national elites, even when the resources are there, long ideological battles over how much of the economy should be free enterprise or centrally planned will be unavoidable. The biggest battles will still have to be fought over land reforms and the doing away of *minifundia*, for the perpetuation of these institutions marks the point at which the unholy alliance between national and international finance capital begins. This is also the point at which the process of value-adding must replace the process of draining away of wealth and where new strategies of productivity and technology must commence.

IV

The proportion of population in young ages 15-34 will reach new peaks in the next twenty years. In the next 20 or 25 years a great deal more of material and manpower investment will be needed for improving the quality of life for the masses through health, medical care, nutrition, education, training, technology, organisational infrastructure and employment. It is wrong to imagine that a quick and rapid drop in the birth rate would immediately relieve the public exchequer of expenditure on such public consumption items as public health, medical care, nutrition and social welfare programmes and education. On each of these counts public expenditure is bound to increase for improving their quality and expanding their coverage in order to ensure a minimal quality of life to the population, for that alone will guarantee a sustained voluntary decline in the birth rate.

Had economic growth, together with improvements in public health, education, welfare services and employment, kept very much ahead of the rate of population growth, the difference between the two would have been readily perceived by even the lowest deciles of the national income range. In that event, the desirability of savings as a plausible and effective alternative to more children would have been a self-evident and a powerful 'communicator' of the family planning message. But this has not happened and the remainder of this decade and the whole of the next will see the highest ever rate of growth to labour force entrants. So, a vigorous family planning drive to the relative neglect of public health, education and employment, would be viewed by the family as an instrument of cutting off its means to more income rather than as a vehicle of augmenting it. Such a general psychological response would have depressing effects on family enterprise all round, which, apart from depressing economic growth, might seriously affect the climate of enterprise and the positive outlook towards production and productivity, which are nationally of even greater moment than the concern with population growth as such.

As the household remains the basis of economic enterprise drawing upon the contribution of unpaid family work, which is rated below free market wage, the benefit-cost ratio of an extra child is positive for the family. A child becomes a source of net inflow of wealth to, instead of from, parents over lifetime. In the context of current household enterprise, whether in agriculture or household industry, the optimum inflow in most countries of the Third World may be reached only when the number of children exceeds two. In that event, the two-child norm comes in conflict with household enterprise in today's level of productivity. It is only in that social situation where this net flow of wealth to parents will no longer be expected over lifetime as a matter of course that the economic calculus of the extra child will be reversed to the point where a couple will not desire more than one or two children.

This has already come about in the upper social and economic strata of underdeveloped societies. The question is how rapidly can the process of economic development spread it among the lowest strata of our population, so that the household as the unit of economic enterprise based on unpaid family labour becomes viable once again, instead of persisting as a near obsolete phenomenon. This is the essential strategy of national planning for economic development which must be matched to the target of the one-or-two child family, and the time paths of both must be made to converge say, on 2000 AD. Neither time path will be fulfilled without the other.

It must be stressed that the fixing of a desirable size, or the rate of population growth, to be achieved by a certain date and mounting a programme for its phased achievement is not enough. Nor does it guarantee its acceptability to the individual, which is crucial, if a population control programme has to be voluntary, instead of being draconically enforced by authority. If a nation aims at a stable population by a certain date, it would be imperative to convince the individual that a stable household size and structure, implied in that stipulation, will ensure the individual's economic welfare and the state would change the national economic structure rapidly enough to guarantee the viability of the household's demographic and economic position. In other words, the household's economic strength and viability must dramatically shift from its age-long dependence on a combination of large number and low productivity to one of small number and high productivity. Thus, within the time stipulated for the attainment of a norm of two children, or a net reproduction rate of one, the economy of a household of three or four must be assured to be superior to the present one of a household of six to eight members. This obviously warrants a dramatic improvement in the technology of production ensuring a much higher level of productivity per person This will involve not only sharp intersectoral shifts, mainly away from agriculture and household to non-agriculture and non-household enterprise, but also from the informal to the formal and organised sectors throughout the economy. This will in turn demand shifts from rural to semi-rural and urban living and dramatic changes in attitudes towards living, eating, associating, working and spending one's leisure. In brief, it will mean little short of a radical transformation of the organisation of family life, of social institutions like marriage and divorce and of economic functions of work and production and, therefore, the productive structure of society as a whole.

This indeed, is what a one-or-two child population policy means in terms of the national economy. Thus, a population policy for the next twenty years must also spell out or unfold the measures by which the stability of the new structure of the population and of that of the household will be maintained. This calls for the spelling out of the nature, technology and structure of the economy that will sustain a four-member household at a higher pitch of economic activity and well-being than the present six or eight member household. That should be the surest way of persuading the mass of the population in the Third World to accept the two or one child norm.

V

The size and the rate of growth of population in the Third World have had their effect on the technology of production and organisation all across the board. In the face of limited availability of land, expanding population has led to fragmentation and the growth of *minifundia* in agriculture, constricting the scope for application of capital and improved technology. It is true that productivity of even small holdings has been high where irrigation has been available and labour is concentrated, costs for alternative employment being prohibitively high.

But the operation of usurious landlords and the prevalence of *minifundia* perpetuates a vicious circle of indebtedness. This has created such conditions in many countries of the three continents that it makes it more profitable for landlords to rely more on human labour and servitude disguised in under-tenancies and share-cropping than invest in modern inputs like irrigation pumps, fertilisers, pesticides and improved implements. Substitution of labour for capital remains relatively more profitable to owners and entrepreneurs because of the abundant labour supply and the servitude perpetuated through the manipulation of tenancies and usufructuary mortgages.

If now the rate of population growth is to be sharply reduced, the technology of production, too, must change. The production structure oriented to an ever expanding labour supply is likely to suffer a temporary drop in productivity. Steps to improve technology are thus imperative. This will call for investment, training, orientation, social reorganisation and restructuring of the distributive machinery, too. What is more, social reorganisation and appropriate technological progress must proceed simultaneously with, if not a little ahead of, the reduction in population size. This is true for household industry and crafts, distributive trade and commerce, unmechanised transportation and the bulk of the institutional and personal services sector, in each of which rudimentary technology facilitates the extraction of surpluses out of available human labour. Abundance of labour operates in favour of technological stagnation and technological stagnation in its turn operates to maintain an abundant labour supply.

Apart from farmers and tenant cultivators, nowhere is this more dramatically evident than among those plying their labour in the so-called informal sectors of manufacturing, trade and commerce, transportation and services in the urban areas. Rapid population growth first contributed to accelerated migration to the larger urban areas, leading to increase of unemployment in informal sector.

A plentiful labour supply facilitates conditions of extracting surpluses at severely competitive wages. This inhibits the development of skills and reduces the need of specialised training. Informal workers perform only those jobs that demand interchangeable skills of simple nature. Employers train informal workers to produce ancillaries, components, spare parts and accessories where rigid quality control is not imperative. This helps employers to bifurcate the task of extraction of surplus from labour: the organised and the unorganised activities. This clever bifurcation curtails the bargaining power of workers everywhere and cuts down costs. When production in the organised sector becomes expensive, part of the work is diverted to the unorganised sector. Within a labour abundant economy, labour's share is further reduced by this process of switching between the two sectors.

It is notable that the above process of exploitation through bifurcation is partly induced by the fact that workers in the organised sector are anxious to keep out new entrants in order to keep their wages high. This is no doubt a consequence of the trade union movement in many countries, where unionised industrial labour has become a

major privileged class in spite of itself, resisting efforts toward full employment and a further dose of income distribution. The employers seemingly oblige the organised worker by diverting part of their production to the informal, unregulated wage sector. In reality, when they are doing this, they are doing it mainly to maintain production at levels which can be sold at prices covering costs and normal profits in the organised sector, while they get part of it done at the cheaper labour costs in the informal sector. Up to the 1930s or even in the 1940s the ready availability of female labour facilitated these adjustments. But since then, the even readier availability of male labour at practically the same real wages has led to large displacement of female labour.

This probably partly explains why the levels of fertility in the lower income and occupational levels in the urban areas are as high, if not higher some times, than in the rural areas. The technology at these levels in the urban areas is often comparable to the technology in the rural areas — the making up of paper bags for carrying groceries demands no higher technology than processing grain for retail sale — and rests equally on abundance of labour supply.

In the urban sector, too, therefore, simultaneous drives to upgrade the technology of production must proceed if the drive for reduction in population growth is to succeed. For, the bulk of the livelihoods even in urban areas are still outside the organised advanced technology and high productivity field.

This is what makes the need to concentrate on the technology of production as imperative as reduction of population growth. While to start with, all production must emphasise labour intensive technologies for full employment, the emphasis must as rapidly as possible shift to intermediate and higher technologies for greater production and to demonstrate, thereby, the superfluity of producing excess population. This is where the advanced countries can help with their superior technological and organisational experience and resources.

VI

Experience in several countries in the second half of our century shows that even in countries as disadvantageously placed as India, Indonesia or Mexico, the convergence of the time paths of improvement in the physical quality of life to that of decline in the rate of population growth, in say 40, if not in 25, years is within the art of the possible; and this, without assuming that few of them would be anything but predominantly agricultural countries and that their urban population would exceed 30 per cent of the total.

An imperative prerequisite for the success of agriculture is land reforms, especially the abolition of tenancies and the elimination of holdings above a ceiling of, say, 10 acres of wet or irrigated land. Most populous countries cannot afford higher ceilings any more. Farm management surveys show that farms of as low as one hectare often record the best productivity. Labour is undoubtedly the most important input.

At the same time, undue lowering of the ceiling may cause a decline of the marketable surplus, particularly of foodgrains, requiring institutional arrangements for extracting surpluses. Even where land reforms are implemented, essential steps to augment the productivity of the numerous small ownership holdings are neglected; namely, functional pooling together of cultivation, management, harvesting and marketing, ownership and management of all inputs and outputs, accounting individual peasant incomes in terms of work points and the elimination of unpaid family work. Without these steps, land reforms will in due course meet with the same fate as that of the freeing of bonded labour.

If a beginning is made in this area, the associated tasks of development of water resources and irrigation, land-shaping, eliminating erosion, contour bunding, levelling, channelling, afforesting, etc can be socialised or brought under common management and lead to higher wages that the higher productivity of land would then afford. The failure of the rural works programme or the crash schemes for rural employment has often been advanced to plead the impracticability of these programmes. This excuse of impracticability squarely rests on wilful indifference to the fact that a small cultivator or agricultural labour, receiving less than the market wage, is not interested in building up durable assets for the landlord alone. Minor irrigation or soil conservation — yes, but for whom? Area development — yes, but for whom? The cream of the benefit goes to the person who does not work for them, leaving no stake to the actual tiller of land. The tillers must have some share in the capital so created out of their own labour.

To secure to the tillers the right to organise into trade unions and obtain minimum wages and working conditions from owner cultivators and tenants, with trade unions assuming forms suited to different land tenure systems, would seem even more important and urgent from the point of view of the future of our population size and growth. Unless this unionisation movement is revived and vigorously pursued with the support and patronage of the government, all talk of freeing bonded labour, or enforcing minimum agricultural wages and improving the economic condition of the lowest 30 per cent of the population will end in sounding brass and tinkling cymbals.

Labour input has been as low as 100 man-days per acre even in the best irrigated areas of West Bengal, while in Japan, before the era of extensive mechanisation, labour input was as much as 600 man-days and in certain areas of China, like Tachai, it went up to as high as 1,000 man-days per acre. Surely in the labour scarce competitive wage market of Japan, 600 man-days of labour per acre would not be possible if farm productivity was low. These figures indicate how profitable work in agriculture could be if supported by effective demand and the means to boost consumption and nutrition. If the number of man-days per acre could be pushed up even to 300, the problem of rural employment and agricultural production in most underdeveloped countries would largely disappear. But this is not possible unless land reforms are given real teeth by conscientious implementation and by supporting institutional measures. The volume of full-time work available can increase spectacularly to reach a state of full employment, even if wages remain low for the time being. What is possible in the rural and agricultural sector is as possible as in the low, intermediate or high technology sectors of crafts, manufacturing, construction, trade and commerce, transportation and services.

Except in minute parts of countries in the Third World, the organisation of industries related to agriculture, like animal husbandry, poultry and fisheries, has remained virtually neglected. One might argue that these enterprises depend on local leadership and not on government initiatives. But the point remains that even governments that have relied on centralised planning have failed to initiate processes of so-

cial transformation in these areas. Similar neglect prevails in the agro-based and small-scale industries, which can well operate on simple technology, but with increasing productivity. Instead, the emphasis in industrial development has been on production of commodities that will have a small privileged market. Demonstrations elsewhere that the basic agrarian reorganisation in an essentially agricultural, so-called overpopulated country, can coexist with technologically developed, highly industrialised sectors without spectacular net transfers of population from the rural to the urban areas have so far been of little avail.

VII

The desired time path of fertility reduction cannot be pursued unless the demographic quality of the population is simultaneously raised. In the present context, the first desideratum is the lowering of the infant mortality rate by as much as will reduce the proportion of deaths below the age of five in the total from the current level of 30 to 35 per cent to less than 10. The second prerequisite is the improvement in the quality of nutrition, that is, the amount of food intake; this can be done not by precious and token nutrition schemes but by universalising employment, giving everybody the right and means to eat. The third is the raising of the sex ratio at least to unity by improving the survival of females. This warrants due recognition of the economic value of women which can be ensured by cutting down on unpaid family labour and introducing a system of social accounting where appropriate money value is imputed to female work. The fourth is the enforcement of universal primary education, adult literacy and the minimum public health and medical care, leading to higher quality and productivity through lengthened life expectancy. All these will create a situation for the decline in the proportion of the age group 0-14 from the present oppressive level of 39 to 42, to a comfortable one of 24 to 27.

So far as the demographic side is concerned, we do not have to go outside the Third World for a model, for we already have one in Sri Lanka. Sri Lanka provides an example of trends favourable to the solution of the type of demographic problems that we are about. These trends were generated without any spectacular improvement at all in per capita income or the economy as a whole. If anything, Sri Lanka's average income is low even by Third World standards, and its nutritional deficiency — even counting tapioca, consumption of homegrown produce and fish — is not above dispute. Employment is still largely precarious and a person has to run after half a dozen chores all on the same day to make a mean living. It has not taken a great deal of investment or infrastructure in Sri Lanka — certainly not what is beyond the Third World's reach — to bring down the infant mortality rate almost to that of developed countries. The difference in the rate of investment in public health, medical care and nutrition to bring down the infant mortality rate from an average of 45 to less than 20 would probably amount to the difference between a highly developed world and a still underdeveloped country.

A crucial factor which is liable to be overlooked is the reforms and policies that led to the present pattern of income distribution in Sri Lanka. These reforms were accompanied and succeeded by improvements in the availability and accessibility of public health and medical care and the spread of education. It is perhaps valid to argue that the land system brought about that *social transformation* that enhanced Sri Lanka's absorptive capacity of education, health and social services, leading eventually to a decline in the birth rate.

VIII

The trouble is that most education, social welfare and nutrition programmes even through bilateral or multilateral aid have attracted the stain of charity and bounty, the flaunted attitude of helping the poor; they are not recognised as essential services to be made available to everybody as an inalienable right. As a result, popular involvement is effectively choked off at appropriate levels by the district, prefectural or village bureaucracy. The beneficiary has little scope of being associated with either the logistics of production or distribution of the products, the selection of recipients and enforcing their attendance. There is little democratic functioning and little give and take between those entrenched at the upper level of the village power structure which controls the destinies of such programmes and the beneficiaries at the lower levels. This appropriation of the role of dispensing social welfare by the vested traditional or elitist interests has been the biggest stumbling block to policies and programmes whose relevance has been acknowledged by all; this is the stumbling block which makes nonsense of dedicated service on the part of a few and puts them at the mercy of an unholy alliance of the elite, the educated and the bureaucrat incapable of eschewing coercion, corruption or fraud.

The democratic functioning, supervision and monitoring of programmes at the village and intermediate levels are also vitally necessary for education, medical and public health, nutrition and even employment programmes. For now there is money in them all and the opportunity of lording it over by those who are inclined that way. The programmes are in the nature of a general bounty from the government. The village triumvirate of power, comprising the district level staff, the village propertied groups backed by relevant political groups, and the village intelligentsia, largely drawn from the propertied groups, finds it, however, handy to transform it into a bounty of their own and to exploit its advantage to the full. In such a situation such programmes degenerate into precious tokenism. The beneficiaries ultimately are quite different from those intended. This inequity is blessed with legitimisation all round from the government, the political groups and the intelligentsia at the national level.

The unprecedented growth in population in the last quarter of a century has immensely widened the population base of those who are at the receiving end of the bounty and correspondingly narrowed this proportion of those at the giving end. Likewise, the concurrent ratio of those who exercise patronage and the power of giving jobs to the enlarging hordes of those who depend on this patronage for employment. Thus, a much smaller proportion of the total population in the Third World today enjoys more absolute power over the life and death of a much larger population than ever before, whether it be the village or the prefecture, the district or the state. This has made for a new quality of synicism, hypocrisy, unconcealed ruthlessness and blatant disregard of moral and ethical principles hitherto inconceivable in public life.

IX

In both the time paths of national economic planning and of stabilising the country's population, the lack of

political will to order the priorities in the light of reason and reality would appear to have thwarted the success that the nations might have achieved.

The national political will in the Third World has been constantly pulled out of shape by the entrenched power structure. Its texture is the same everywhere, whether in the remote village or the capital city. It can be identified as the industrial lobby on the one side and the rich farming lobby on the other, balanced skilfully to its own advantage by the political and civil bureaucracy, powerfully aided by the intelligentsia. Whether in the evolution of the mixed economy or in the shutting out of a conscientious voluntary worker from working among the lowest 40 to 50 per cent of the population in a village, it is the political and civil bureaucracy, powerfully aided by the intelligentsia, whose class interests are identical, that have successfully acted as the arbiter, cornering considerable gains in status for themselves all the time. There is no doubt that this middle section is greatly responsible for lack of political will and for thwarting democratic decentralisation on egalitarian lines. Even the most populist and radical slogans cannot hide this reality any more.

Of the lack of political will to order the priorities, the course of the last 25 years is strewn with glaring examples. There will be many more in the future, if the governments do not take heed. It is possible that land reforms are delayed on the ground that their short and long run effects merit more mature consideration. But there is not the slightest doubt that the solution to the problem, for example, of employing India's rapidly expanding labour force lies, even in the present dispensation, in approaching as fast as possible towards the fullest utilisation of irrigable capacity estimated at 52 per cent of the total area under crops as against the present 22 per cent. Apart from expensive flow and electrically energised irrigation no serious thought is given to a programme, for example, of digging surface storage tanks wherever feasible on a large scale and of supplementing it with extensive landshaping, soil conservation, bunding and channel digging. Yet, these have indeed been the mainstay of India's, and China's, irrigation in the past. They are capable of so much extra employment for many years to come. Instead of expanding the scope for increased foodgrains production through proper water management, we are more concerned, against the advice of acknowledged experts, in securing a higher procurement price for grain, which, as we all know, will really benefit the rich farmer. The accent continues to be on maximising private profit and not on national productivity.

There is another matter in which India can provide an excellent case study for the Third World. A sudden but predicted increase of a few million of young people between the ages of 15 and 22, caused by the post-war baby boom of the late forties and early fifties, together with the displacement of Blacks from their traditional occupations by technological change and their eventual trek to the city, led in the United States to tremendous upheaval and turmoil in the second half of the 1960s. Among the reasons for this upheaval were the shortage of schools and schooling facilities, teachers, medical facilities, employment, dwelling and social security. This, despite the fact that the United States had the money and resources to provide the material amenities and pay for the manpower.

Contrast this with the size of the problem in India. According to Ambannavar's [2] medium series of projections, the population of age group 5-9 will grow from 39.2 million males and 36.1 million females in 1971 to 57.5 million males and 53.6 million females in 2000 AD; that of age group 10-14 from 34.4 million males and 31.2 million females in 1971 to 55 7 million males and 51.6 million females in 2000 AD; and so on. There is hardly any quinquennial age group up to 40-44 where the population does not go up for each sex by nearly 20 millions in 30 years. Such is the enormity of the increase in the number of children, adolescents, young adults and mature adults to be made literate, educated, trained, employed and provided with public health and medical care. It is improbable that the government will find all the money and resources to fulfil the existing standard bureaucratic norms of schoolhouses, equipment, textbooks, teachers, teacher-training and of public health and medical care, dispensaries, clinics, hospitals, etc, in addition to the necessary capital and resources for providing them employment. It is also improbable that government will be able to pay each person employed the existing standard wages plus dearness allowance or insist on no more than the standard hours of work. And yet the country will have to have reasonable measures of all these for the entire population, if it wishes to retain its place in the sun. On top, it will have to invest heavily in the areas just described. Under the circumstances the country faces the most arduous challenge in applying all its ingeniousness, powers of improvisation, experimentation and innovation for putting its manpower to the best and most profitable use. This cannot be achieved without the maximum of vertical and horizontal decentralisation and delegation to grassroot groups who will have to deliver the national targets by whatever means they consider best. Other norms and standards will have to take command.

While the Mahalanobis-Nehru Plan for the expansion of the capital and producer goods sector is the one leg on which the country must continue to stand, a new elaborate mechanism of democratic decentralisation must be the other leg on which the country will walk to its future. On this other leg must be put the load of securing not only the willing and equal participation of the lowest of the low, but also almost the whole of agricultural inputs and outputs on the one hand, and the widest provision of wage goods on the other. Democratic decentralisation must also assume responsibility for the physical quality of life, development of human resources and the welfare sector. It is quite obvious today that without a full process of decentralisation and a wide range of techniques of production and organisation for harnessing human and natural resource which will ensure the retention of the value-added element at levels where they will be most enriching to the national life, we cannot have the improvement in employment, consumption, nutrition, housing, education, public health and medical care that we profess as our goal. Different priorities, commitments and motivation will determine the choice of local techniques for getting surpluses out of our abundant labour. There is no way out for this poor country except through the process of primitive accumulation and the right kind of motivation which only decentralisation can harness.

X

All poor countries are essentially rural and peasant societies. India or Brazil, Pakistan or Indonesia, in spite of their massive infrastructures, industrial base, scientific, technical and entrepreneurial excellence are essentially rural and peasant societies. The

problem is therefore firmly embedded in rural and agricultural employment. The problem also lies in ensuring that the value-added process is more equitably redistributed between the industrial base and the agricultural base. Agriculture will have to yield the surpluses for the creation of capital, energy and producer goods industries without which there can be no long-run hope, nor can there be any hope of achieving a semblance of rural-urban wage equilibrium. Instead of prosperous towns, we shall continue to have large increases in the poverty-induced tertiary sector in cities sinking more and more into bazaar-type economies. Rural areas will, in that case, continue to be drained not only of wealth but of educated, able-bodied youth. Rural wealth will concentrate in the hands of the physically old and culturally poor.

The period 1950-75 saw partial resolution of the structural contradiction behind the physical stranglehold of empires over subject countries. The period 1975-2000 will, I fear, be the cockpit of continuing structural contradiction between rich and poor countries. But this external structural contradiction will be reinforced by the internal structural contradictions between those who control resources and those who produce these resources in the poor countries. In the name of *realpolitik*, of stability and *status quo*, of saving whatever has been accomplished, there will be a further polarisation in the 80s of these contradictions within poor countries. The rich in the poor countries will find their allies among the rich countries.

The demographic structure will deepen and widen these contradictions, and bring them relentlessly out in the open. The young dependency rate will slightly decrease, but the proportion of age group 15-24, 25-34, clamouring for employment will increase. A higher rate of literacy and technological education will build them up into a critical mass of discontent in city and village. There will be less of the objective correlation between literacy, educational and technological equipment on the one hand and application of these capabilities on the other. Women will get to be a new disruptive force to reckon with. Age at marriage will rise for young women. For, parents will use them more and more instead of getting them married to release their sons for pillar to post migration, and young men will resist submission to marriage for lack of employment. Patterns of nuptiality will change. For women there will at best be a weak statistical U-shaped curve in employment offset by dwindling wages. When women are finally roused, there is bound to be trouble. The strain on infant mortality, health and the environment will grow. Since in poor countries non-commercial energy still accounts for more than 50 per cent, there will be problems of ecology, erosion and pollution. There will be a dingdong between pro-natalist and anti-natalist trends in the 80s depending upon the proportions that are making good and those that are not.

Even as the area of balanced reciprocity between rich and poor nations is in jeopardy, that among the rich and the poor in poor nations will further dwindle. Fewer people in poor countries in the 80s will have more absolute power through the iron law of wages over much large populations than ever before. Authoritarianism will have its mighty fling. The evidence is before all of us to see.

In India where production of foodgrains has grown from a mere 50 million tonnes in 1950 to 123 million tonnes in 1977 and where 20 million tonnes are held as buffer stocks, a large proportion of the population still goes hungry. Yet with strictly equitable distribution a mere 95 million tonnes would give adequate nutrition to everybody. The buffer stocks of 20 million tonnes are therefore in a way fictitious, and in another way catastrophic. According to the rates of cereal consumption recommended by the National Institute of Nutrition, 20 million tonnes of foodgrains can keep roughly 50 million of the urban and rural poor — infants, children, women and men — adequately fed for calories for three years together. This can make a major difference between the current picture of starvation and malnutrition in India on the one side and adequate nutrition for the bulk of her deprived population on the other. The food-for-work programme for building up national and community assets can easily be lifted from its below-market, semi-starvation-wages-in-kind to a full-wage-in-kind programme, and put enough self-respecting purchasing power in the hands of those who are at present unemployed. This can in its turn have a wholesome impact on the demand for wage goods, the lack of which is responsible for our wobbling industrial growth. Instead, despite the protestations of the Food Corporation of India, much of of this buffer grain irretrievably deteriorates in unsatisfactory storage and feeds rodents and unwelcome pests instead of human beings. It is this way that a large spurious buffer stock is a mixed blessing. Another good harvest might as well result in a catastrophe, with agricultural prices crashing, buffer stocks still further rising and rotting, food crop acreage shrinking, and yet with almost a constant proportion of the population chronically going hungry.

There will be still another contradiction in the 80s. Many poor countries are now rich in scientific, technological, managerial, entrepreneurial and economic talent. The way this talent is fending their countries in very unequal combat against rich countries is proof of what I say. On the other hand, poor countries are still very poor in institutions, their accessibility and distribution over space, in their administrative, organisation and extension machinery and personnel. This contradiction will deepen in the poor countries in the 80s. What will be the scientist's, the technologist's and the researcher's role in this conflict of the 80s? Will they play safe and continue their role of accomplices in devising palliatives in an effort to shore up little fragments against the impending ruin? Or will they, while working on the side of sanity and continuity, still insist on long run solutions?

XI

We have proceeded on the hypothesis that the quality of the population should improve simultaneously with intensified population control. There is enough justification for the assumption that while the family planning programme must be quickened in pace, other nationwide synergistic social and economic programmes must be intensified simultaneously to obtain greater mileage out of the programmes of population control. Without such concurrent, supportive measures the success of population control as a one-shot measure operated however vigorously over a short span of time is very likely severely to backfire.

Our second hypothesis is that, while underdeveloped countries will need all the capital they can muster to develop their capital and producer goods sectors and infrastructure (thee will be little choice but to put as much of them as possible in the public sector) to secure and augment the value-added element to their natural resources, for internal consumption or external trade, measures

to improve the quality of population to the point, where the support for tight control measures could be easily generated, are inexpensive and possible at the present level of the Third World's economic development, provided the ground is cleared for greater public involvement in the welfare and economic programmes through greater vertical decentralisation and horizontal spread. The Third World would never scrape up the financial and other resources to achieve all these targets within the foreseeable future if the programmes continued to be based on standard norms of expenditure, outfit and per capita performance in imitation of the more affluent countries, could possibly overfulfil the targets if the right type of motivational and organisational effort is mounted to build up on the social deployment of surpluses of human energy and enterprise for community needs.

At the same time, we are reawakening to the fact that a great deal of regional planning awaits to be designed and executed in each region, on the basis of decentralised local decisions in a peasant society in order to organise production to produce the requisite economic surplus, albeit at very low levels. For the new task all the resources of patiently developed spatial planning techniques will have to be pressed into service to harness human energies and low level resources for the success of local plans. We have so long thought of planning in terms of sectors of economy, not in terms of finite spaces.

We shall now have to think strictly in terms of what the traffic will bear in each finite regional space. One of the bewilderments with which the unwary and elite spatial planner is confronted at once is the demand in the name of egalitarianism for the best of everything, of which nothing or little exists now in an area. The norms and standards of such efforts will have to be tailored to the resources, and all fancy notions of conspicuous, unrealisable monuments and scales of operation rigorously abjured. It is not as if we have not had people who showed us the way. Tagore and Gandhi showed us how to build schools, dispensaries, hospitals, produce fertilisers and an entire range of infrastructure including banks and co-operatives suited to our scale of poverty; Mysore [illegible] in [illegible] have taught us how to cut our coat according to our cloth. The process of accumulation of capital in a peasant society is a slow, patient and arduous process but it can be done while letting in the winds of modernisation through education and by reducing income disparities. But it is important constantly to remember that a country does not belong only to the Happy Few. Although the Third World will still remain poor around 2000, with the steady forward march of technology and social organisation, there should be extraordinarily few situations which could not be effectively handled by the united will of over three billion people.

District Planning in the Context of Multi-Level Planning

B P R Vithal

Multi-level planning requires a hierarchy of levels with appropriate decision-making authorities at each level.

The scope of decision-making at each level of planning will depend, however, upon the objectives of planning at that level within the overall objectives of the organisation, considerations of administrative and economic efficiency, and the constraints of the political system.

As the Draft Five-Year Plan has put it, "It is possible that there should be a hierarchy of planning decisions at different levels".

THE planning function can be divided into four sub-functions, *viz*, planning, implementation, Co-ordination and review. It is not necessary that all these functions are discharged by the same planning body. It is quite conceivable that the body at one level of hierarchy is responsible for planning, while the body at a lower level is made responsible for the other three functions. The functions, therefore, are separable and assignable to different levels in the multi-level model, except to the extent of co-ordination (which has been put in brackets) which must necessarily go either with the implementation function or with the review function or with both. The fact that these functions are separable but are part of the overall function necessary for the achievement of any activity means that where they are separated and assigned to different levels there would have to be vertical linkages to ensure proper co-ordination of these different functions and the achievement of the overall objective of the activity concerned. Since the division of these functions between different levels will differ from activity to activity, we have a situation at each level where the functions of the planning body will vary according to the different activities taking place at that level. For instance, for certain activities the planning body may have all the four functions, whereas for some other activity it may be responsible for only implementation, co-ordination and review, and for certain others only in regard to co-ordination and review. There may also be certain activities taking place at the same level in regard to which the planning body has none of these four functions but which impinge upon other activities of that body and hence have to be taken into account at least as exogenous but relevant factors.

This framework can be understood in concrete terms with reference to the planning activity at the state level. The state government is the planning organisation which discharges all the four functions mentioned above in regard to activities which constitute part of the state plan. It discharges only the implementation, co-ordination and review

funct[illegible] sponsored sche[illegible]s. In regard to certain schemes in the Central sector which are both planned and implemented by the concerned Central ministry, the state government may still have, in certain cases, the co-ordination function at the state level — such as, for instance, the provision of infrastructure by the state government for a major Central project such as a steel plant. Then there are some activities taking place in the Central sector at the state level in respect of which the state government does not have any of these four functions but which it will have to take into account as a given exogenous factor in formulating its own plan — such as, for instance, a decision regarding railway lines within the state. Similarly, to the levels below the state, responsibilities regarding implementation or only co-ordination and review might be delegated in respect of activities for which the state level body still retains the function of planning or even of implementation. This situation leads to vertical linkages from the district to the state and to the Central level in respect of different state plans and Centrally sponsored schemes. It leads to horizontal linkages at the state level between the state plan schemes and Central sector schemes.

It has been a curious aspect of the thinking on the planning process, so far, that while this has been the situation in practice at the state level, whenever district planning was discussed in the past a presumption was somehow raised very often that delegation to the district planning body in respect of any activity must include all the functions mentioned above and, to the extent delegation was restricted only to some of these functions and some others were retained at the state level, it was taken to be a dilution of the process of district planning. It is, therefore, a welcome realisation that "a hierarchy of planning decisions at different levels are possible". District planning also has to be conceived only as part of the above model and in deciding the levels of planning, whether it be block or district, and the planning functions to be assigned to these levels, this separation of functions and the assignment of different functions to different levels, with suitable vertical and horizontal linkages, has to be taken into account.

In a multi-level hierarchic model, the planning process may be autonomous and autarchic in its totality at the national level. However, even here, there are inescapable international constraints. But, within the model and at each level [illegible] be [illegible] by [illegible] and autonomous because of the inevitable vertical linkages. This is not a reflection of any imperfection. It is of the very nature of a hierarchic model. In this connection, it is interesting to see how such a multi-level hierarchic model has many of the features of what Arthur Koestler has called 'the Holarchy'. "The point first to be emphasised is that each member of this hierarchy, on whatever level, is a sub-whole or 'holon' in its own right — a stable, integrated structure, equipped with self-regulatory devices and enjoying a considerable degree of autonomy or self-government." But, "They are Janus-faced. The face turned upward, toward the higher levels, is that of a dependent part; the face turned downward, towards its own constituents, is that of a whole of remarkable self-sufficiency." The rules he has given for such holarchies also apply to multi-level planning.

> "Functional holons are governed by fixed sets of rules and display more or less flexible strategies.
> The rules — referred to as the system's 'canon' — determine its invariant properties, its structural configuration and/or functional pattern.
> While the canon defines the permissible steps in the holon's activity, the strategic selection of the actual step among permissible choices is guided by the contingencies of the environment.
> The canon determines the rules of the game, strategy decides the course of the game.
> Every holon has the dual tendency to preserve and assert its individuality as a quasi-autonomous whole, and to function as an integrated part of an (existing or evolving) larger whole. This polarity between the self-assertive and integrative tendencies is inherent in the concept of hierarchic order, and a universal characteristic of life.
> The self-assertive tendencies are the dynamic expression of the holon's wholeness, the integrative tendencies of its partness.
> *Hierarchies can be regarded as 'vertically' arborising structures whose branches interlock with those of other hierarchies at a multiplicity of levels and form 'horizontal' networks: arborisation and reticulation are complementary principles in the architecture of organisms and societies."*
> (Arthur Koestler, "Janus — A Summing Up").

Another aspect of the somewhat mistaken view of district planning which used to be taken in the past is the fact that it was generally assumed that this would precede the state level planning. To the extent the state level planning preceded district planning or district planning depended upon certain deci[illegible] [illegible] ready taken at the state level, it was assumed that district planning had been vitiated. Here again, it was forgotten that at the state level itself planning began only after and within the framework of a national approach to the Plan which was already decided upon. It was never contended that the national plan should be the sum of states' plans, but it was for quite some time contended that the state plan should evolve as the sum of district plans. The multi-level model shows that this is not a feasible proposition. It is, however, conceded now by the Dantwala Committee that the District/Block level planning teams would have to be given a broad indication about,

(a) the total state plan and its priorities,
(b) the financial parameters within which to plan, and
(c) the continuing schemes to which a part of the Plan expenditure is committed.

The decisions regarding district and block planning will have to be taken within the overall framework mentioned above. Taking into account the availability of the necessary expertise and the span of most planning activities, the proper level for planning below the state level is the district. The block may be the unit for implementation of several plan activities and for the preparation of detailed employment plans, but the level at which an integration can take place of most plan activities would be the district.

The national plan document has itself envisaged that some major investments which have regional implications — such as large-scale irrigation, power, and transport — must necessarily remain outside the scope of planning for limited areas. But the bulk of the remaining investments in areas such as agriculture, minor irrigation, animal husbandry, etc, would be amenable to planning at the local level. In keeping with this line of thinking we can indicate the district-wise segments in each sectoral plan separately. The District segment will include the allocations for all schemes located in the district. These will consist of the following two types of schemes:

Part A

Schemes located in a district but having importance for or benefiting an area more than the district; for instance, the allocation on a canal of the Nagarjunasagar Project in a district will form part of the district segment but will come under this category since this is part of the Nagarjunasagar project; similarly, a major or medium industry will come under this category. So also, a re-

is or training centre etc. intended to cover an area, larger than the district.

Part-B

Allocations for schemes located in the district and benefiting only the district or a portion thereof; examples of this will be minor irrigation, rural electrification and small-scale industries etc.

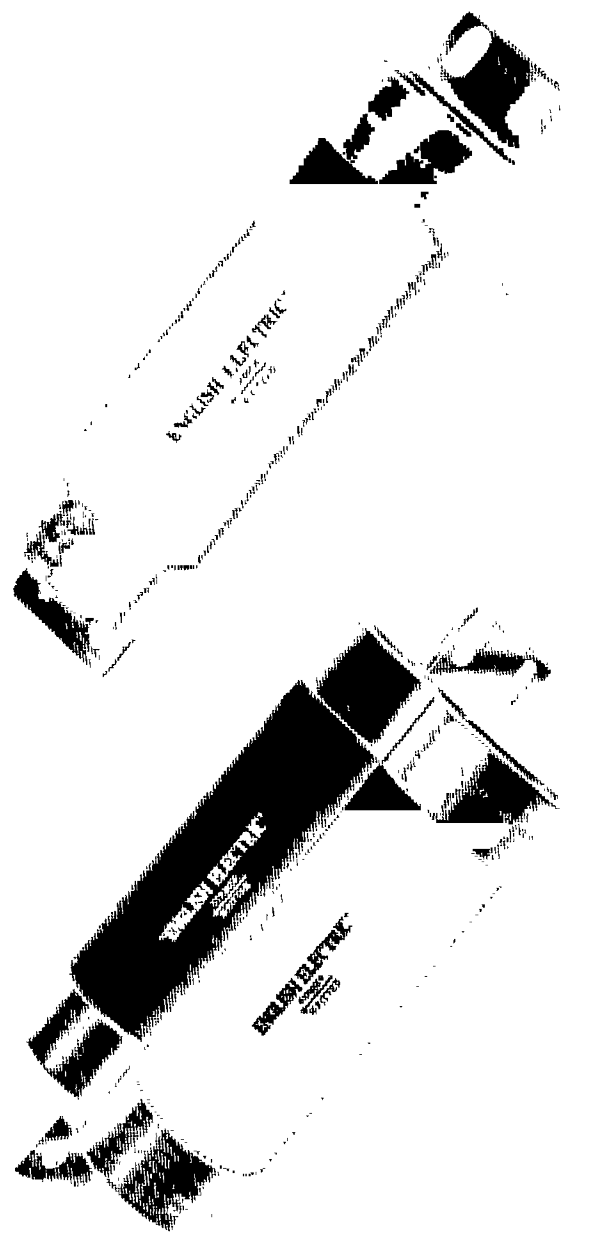
The idea is that the schemes falling under Part-B above will constitute part of the district plan in respect of which the district planning body will have discretion in regard to such matters as locational decisions, rephasing, etc, which they would not have in regard to schemes under Part-A. However, the schemes under Part-A would also be indicated within the district plan frame, because they may have an important bearing on the development of the district as a whole and would, therefore, have to be taken into account in preparing the plans for the items falling under Part-B. For instance, the district planning body may not have any discretion in regard to the phasing or implementation of the portion of a major irrigation project falling within that district which is a part of a larger and different planning decision, but the phasing of that particular activity would be an important input for the preparation of the district plan since the agricultural and credit plans, which form part of the district plan, would have to take this important fact into account.

The district authorities can take up preliminary work which will enable the following aspects of a district plan being worked out:

(a) A profile of the resource endowment of the district;
(b) Levels of development reached so far in important sectors with a review where necessary of the ongoing plan schemes in particular of their continued utility or relevance for the future;
(c) Spillover commitments arising out of the Fifth Plan schemes.

As soon as the Draft Outline of the state plan is finalised a plan frame for the district plan, which will include the allocations for items under 'A' and 'B' of the district segment mentioned earlier, can be prepared with a district-wise break-up and communicated to the district planning authorities. The plan priorities and the important targets adopted for the state plan would also be communicated. Based on the preliminary study mentioned above and on this information the district planning authority will be expected to prepare the district plan. The district plan will indicate, besides the three items mentioned earlier.

(d) The strategy adopted, based on the district profile and district review mentioned earlier and (i) the district strategy including spatial aspects, and (ii) the plan frame indicated;
(e) State sector schemes with those falling under Part-A of the district segment and their implications for the district;
(f) Sectoral plans for the activities falling under Part-B of the district segment together with the actual phasing;
(g) Scheme-wise details of the more important schemes together with physical targets;
(h) Special plans for backward areas in the district; and
(i) Local participation particularly resource mobilisation at the local levels.



On receipt of the district plans they should be scrutinised at the state level for internal consistency as well as consistency with the overall priorities of the state plan. In regard to activities falling under Part-B of the district segment, any sectoral rephasing necessary as a result of the district plans can also be considered. On the basis of this, the district plans as well as the district segment of the state plan can be finalised.

The block will be the level for implementation of most district plan schemes, and particularly ... employment schemes. To the extent the implementation of employment schemes requires planning and co-ordination in spatial and temporal terms, block plans will have to be prepared keeping this objective and the district plan frame in view. This will involve the same kind of vertical linkages with the district as we envisaged at the district and state levels above.

The important point in this model is that the planning process is looked upon not as the inter-linking of autonomous processes at different levels for effecting co-ordination between them but as a distribution of partial functions to different levels, with vertical and horizontal linkages becoming necessary because of their inherently incomplete and partial nature. Autonomy and completeness in planning can be achieved only in the total national structure, and at no lower or intermediate level. However, this does not detract from the importance, flexibility, or limited autonomy possible at these levels within the overall structure. Koestler's idea of a 'Holarchy' mentioned earlier enables us to understand this process better.

Class and Caste in India

The Expendable Goals

THE government's Economic Survey for 1978-79, just released, seems on occasions to show some perception of the structural malaise afflicting the economy. But on more careful consideration the appearance turns out to be deceptive. It proves, yet once again, to be a case of paying lip-service to certain noble causes, of declaring that those concerned are on the side of the angels. Thus neither the overall performance of the economy nor specific policies of the government are assessed in relation to goals like employment generation and amelioration of poverty which are espoused so enthusiastically in the abstract.

For example, the Economic Survey emphasises the importance of favouring the "use of labour in preference to capital" and urges that "in particular, factors which encourage capital intensity in the organised industrial sector need to be eliminated". This is in the context of the admittedly poor employment growth in both industry and agriculture. To quote from the Survey, "although the overall performance of the economy can be regarded as satisfactory, its impact on the basic problem of unemployment is not perceptible". The Survey also refers to amelioration of the living conditions of small farmers and marginal farmers as "the most important plank of the government's programme for the elimination of poverty" and candidly admits that this is "another problem which [though] of the highest importance to

some of the development objectives of government seems to have received insufficient attention during the year".

The Economic Survey also makes a pointed reference to the unsatisfactory record of production of pulses and other cash crops compared to superior cereals like rice and wheat and attributes this partly to the fact that "the operation of price support policies in respect of superior foodgrains has not been such as to bring about a shift of cultivation in the required direction". This failure is particularly underscored in relation to sugarcane. As the Survey rightly points out, the high profitability of sugarcane cultivation which has been responsible for the present glut of sugarcane has resulted from "high state-advised prices" which the sugar mills pay to the farmers and not from any appreciable increase in yields. Also, this benefit accrues to a limited group of cane-growers. It does not accrue to those producing khandsari and gur, particularly in the northern region. Above all, "sugarcane is one of the most water-intensive crops and in a country where irrigation is relatively scarce, the availability of undue advantage to this crop is likely to aggravate the existing problems of sugarcane production and also the growing imbalances in the production of other important crops". The argument has been carried further to emphasise the importance of "systematic crop planning" so as to improve the output of pulses, oilseeds and fibres by "a diversion of marginal irrigated and non-irrigated land from crops such as wheat and sugarcane to these".

However, the seeming awareness of wider issues which the above references to the Economic Survey reflect is contradicted by other observations of the Survey. Let us take the example of the Survey's emphasis on the need to discourage capital-intensive techniques. First, nowhere throughout the Survey is there a word of suggestion how precisely to achieve this objective. The country's entire taxation system, for instance, is loaded in favour of capital-inte[illegible] techniques. Yet in the section [illegible]sures towards tax reform", the [illegible]vey is full of praise for "incentives to work, save and invest". Similarly, the Survey has no comment to m[illegible] when it faithfully reports the reduction in the lending rates of commercial banks brought about by the abolition of the tax on interest income in the 1978-79 budget.

More significantly, in the entire section on "industrial investment" the emphasis is on the increases in disbursements of term-financing institutions, in capital goods licences issued and in imports of capital goods. The Survey also draws satisfaction from the fact that in the private sector "the increase in gross fixed assets formation during 1976-77 appears to have been of the order of 8 per cent and the tempo seems to have been maintained during 1977-78 also". It approvingly sets out the rationale of a regime of import liberalisation which has "sought to reduce the number of controls and regulations to a minimum and to enlarge substantially the scope of liberalisation of imports mainly with a view to satisfying the imported input requirements of industries to enable them to improve their performance and thus contribute to development and export efforts". The most important change in import duty referred to is the reduction of duty from 40 per cent to 25 per cent *ad valorem* "in respect of wide ranging items of capital goods". Now, studies have generally shown that larger imports for export production and larger dependence on imported capital goods as compared with intensified import substitution imply relatively greater capital intensity. Even the so-called safeguards "provided to protect the interests of small scale, tiny and cottage industry sectors in keeping with the priorities of growth" would appear to be more an eyewash for, as the Survey itself recognises, it is the large-scale sector where "in particular, factors which encourage capital intensity in the organised industrial sector need to be eliminated".

The half-heartedness of the Survey is even more conspicuous when it deals with the problems of unemployment and elimination of poverty. The Survey begins with the observation that "the performance of the Indian economy in 1978-79, the first year of the Five-Year Plan 1978-83, must be regarded as most encouraging". This claim is repeated elsewhere, but with the qualification that "its impact on the basic problem of unemployment is not perceptible" or that "progress has been slow with regard to land reform, tenancy reform and consolidation of holdings which are crucial to the viability of [small and marginal farmers] and to government's efforts to raise the standard of living of the lowest sections of society". Now, if no progress has been made in regard to the objectives of removal of unemployment, poverty and destitution, how can the performance of the economy during the year be described as having been "most encouraging". In other words, the tasks and priorities of development, as perceived by the authors of the Economic Survey, continue to be conventional ones, and the sentiments in support of greater labour-intensity in investment and removal of unemployment and poverty have been thrown in here and there as mere sugar-coating.

This no doubt explains why the authors of the Survey do not see any contradiction between the espousal of these wider objectives and their wholehearted pursuit of export promotion under a regime of more and more generous export assistance. The argument is also advanced that "developing agricultural exports is necessary". The Survey is content with a factual account of the mounting fiscal subsidies — as though the surrendering of enormous amounts of government revenues through subsidies and tax concessions to the urban and rural rich does not in the least impinge on the objectives of employment generation, removal of poverty, reduction of disparities, etc. The Survey also records unemotionally that "imports of man-made fibres increased sharply from Rs 30 crores in 1976-77 to Rs 192 crores in 1977-78 to meet the growing demand and for substituting cotton which was in short supply during the year. Similarly, raw cotton imports increased by Rs 69 crores .. ". The import of man-made fibres has persisted in 1978-79. All these happened when "the scheme for production and distribution of controlled cloth has been encountering considerable difficulty. Despite various concessions given from time to time, the response from the private sector has been half-hearted. Consequently it has been decided to phase out the production of controlled cloth in the organised sector and to leave the supply of cheap cloth to the handloom sector ultimately". For its "halfhearted" response to the controlled cloth scheme, the textile industry has been rewarded with the soft loan scheme. Even here, the progress has not been satisfactory, for the private sector is not above looking a gift horse in the mouth. Thus in regard to the soft loan scheme, "there were some objections from the industry, primarily to the conversion clause which have since been waived. Recently, there have been some further relaxations in respect of bridging loan, documentation commitment charges and personal guarantees and promoters' contribution. It is felt that, with these concessions, the pace of disbursement of soft loans

will pick up substantially". Clearly, the authors of the Economic Survey are not concerned about the extent to which such transfer of resources to a microscopic class of industrialists inhibits the 'development process' and blocks the achievement of all the wider objectives which elsewhere they pretend to espouse.

The Economic Survey in any case makes no mention of reducing inequalities of wealth and income. It also does not refer even once to the MRTP regulations or regulations regarding FERA companies or those on foreign collaborations. This amnesia is all of a piece, since it is only if one were serious about removal of poverty and unemployment that one would be exercised about a pattern of development which permits the resources of the community to be freely appropriated by a small local minority joining hands with the foreign capital.

Classes in Caste Idiom

AS the economic crisis has deepened in the countryside and in the cities, and as various sections of the people who bear the brunt of the crisis, in terms of lack of a means of adequate livelihood and worsening living conditions, have been organising themselves against this situation, the forces of law and order have performed their appointed task of putting down any unrest that accompanies such organisation However, more disturbing has been the tendency among the people themselves towards mutual violence, often along communal but far more often along caste lines. Some of the lowest castes have been the most common targets of such violence. Concentrated outbursts of this kind have occurred in Marathwada in Maharashtra and in innumerable places in Bihar, Tamil Nadu, Gujarat and Andhra Pradesh, to name only a few of the states Alongside of this has been the tendency for certain political parties and forces to try to consolidate themselves by espousing the cause of the so-called backward castes which are numerically large and relatively small sections of which also represent an economically emerging force, especially in agriculture.

It is the depth and strength of the seeming caste divisions which have led some to argue that in addition to 'class' divisions there persist 'caste' divisions in Indian society The suggestion, sometimes explicit and sometimes implied, is that caste divisions are outside of the pale of class divisions, having their roots in people's consciousness; that they hinder class unity; and that, in the face of economic difficulties, they result in internecine violence among people most of whom are unquestionably on the same side of the class divisions in society. From this the conclusion is sought to be drawn that those who claim to represent the interests of the masses of workers and peasants have not paid adequate attention to the 'caste factor' in Indian popular consciousness and political life. Some even go so far as to attribute these failings to the specific caste origins of the leadership of the concerned political organisations.

It is perhaps best left to the political organisations to answer these charges, but those who claim an interest in the progressive emancipation of the people of this country need to be clear about the nature of caste — its material basis in history and in the present, and the reasons for its continuing use in the conduct of politics by those who control that politics. Caste, should indeed be a burning issue for the ruling classes in this country, for they are the ones who own the land and the capital, employ the labour of others directly or indirectly, and make it their business to extract the maximum surplus under one system or another. It is also a burning issue for those who toil and find not only that their work never wins them an adequate livelihood but also that their own organised progress is hampered by their division into castes and by the warring among castes. What might otherwise have been an intellectuals' debate therefore becomes a central one because, if caste is represented as a major factor in a social development but beyond the pale of class, we are led into quite distinct conclusions about the necessary forms of mass organisations and their programmes. The danger is that such conclusions might suit the rulers admirably.

The analytical conclusions of the contributors to this number represent various trends in the approaches to understanding the character of the Indian State and the class divisions in Indian society. Since much of the debate employs Marxist language, it is important to remember that classes are defined by the relations in which the various sections of society stand to the means of production, by the manner in which the surplus is expropriated from the actual toilers, by which sections within and outside the country appropriate the surplus value from the actual toilers and by what do the expropriators within the country spend it on. Regarded thus, today's caste divisions are a carryover of feudal class divisions. However underpinned caste division may be with heredity, ritual, cultural and pollution-conscious practices, etc, for the majority of Indians the material base in relation to land and extraction of surplus from the land is inescapable. For Indian society, as for every other society, "history has been the history of class struggles". Yet, if the precise identification of classes in Indian society has proved so elusive, it is because the "manifold gradations of social rank" which Marx speaks of for the West (patricians, knights, plebians and slaves in ancient Rome, and the feudal lords, vassals, guild-masters, journeymen, apprentices and serfs in Europe of the middle ages) have taken in the Indian context the form of caste and caste has been further complicated by quasi-religious sanctions and prohibitions specific to Indian society.

The obvious economic foundations of the Indian caste system have always been recognised and its defenders have taken pride in its contribution to ensuring what they consider to be social harmony. What, however, requires study is how profoundly caste has really affected the other processes of change or whether caste has not been conveniently used by other forces to perpetuate underdevelopment and to limit the gains of development among a few. In the past in India, neither the anti-feudal struggles of lower caste organisations nor the anti-imperialist struggles of ambitious nationalists (among both of whom were would-be industrialists and bureaucrats), fully succeeded, as the two struggles never merged under a single leadership. What is crucial, therefore to taking positions on the place of caste in Indian society — and hence the place of caste in the formation and programmes of mass organisations — is to look at the concrete development of the political economy of India, the nature of the capitalism that exists in industry, the penetration and role of foreign interests in all sectors and branches of the economy and government, and the pattern of employment and day-to-day lives of the toiling masses in the vast rural areas and in the messy urban concentrations,

NEW DELHI

BHEL's Controversial Collaboration

P RAMAMURTI's investigative work, "BHEL's Dangerous Truck with Siemens", highlights particular features of a collaboration deal with a West German multinational and draws attention to the larger issues in technology and policy at this sage in the country's industrial and economic growth process.

A similar controversy had surrounded the Bokaro project in the early sixties. The US government had offered to undertake the construction of this large project on its own terms; the Government of India had decided after protracted negotiations not to accept those terms; and it had subsequently switched over to the USSR for help to build Bokaro. But in the case of Bokaro, the crucial question was why, after three steel plants had been built in the public sector on entirely turnkey basis, had sufficient capability not been developed within the country so that Indian agencies could be the prime consultants in such a project.

However, even the arrangements subsequently entered into with the USSR for the construction of Bokaro did not quite fulfil Indian conditions. There was only the concession that a public sector consultancy agency — then the CEDB of the Hindustan Steel, now known as MECON — was associated with the Soviet consultancy and engineering agencies as an understudy. And the Soviet side agreed to use such Indian-made equipment as conformed to its own designs and standards for the plant. In any case, the equipment-making facilities for steel plants that then existed in India had been developed with Soviet assistance and participation.

Since then, India has made big strides in designing and engineering over a wide range of services, establishing capacities for the manufacture of a wide range of machinery and equipment. There is hardly an industrial project that cannot be set up now with our own resources in men and material. Our technical services could well acquire the basic process knowhow from abroad, by outright purchase, and supplement the indigenous supplies of machinery and equipment with selective imports of some specialised items.

It is against this background that the wide-ranging technical collaboration proposed by Bharat Heavy Electricals with Siemens of West Germany has raised a controversy. Ramamurti's exposition of the proposed collaboration pertains to these doubts and suspicions. For a proper assessment of the deal with Siemens it is necessary, however, to appreciate that it concerns a genre of technical collaboration which is significantly different from the setting up of new projects such as a steel plant or a fertiliser plant or even a plant for manufacturing machinery and equipment — such as heavy engineering plants at Ranchi under Heavy Engineering Corporation and Hindustan Machine Tools, or the plants grouped under the BHEL itself. It is also necessary to note some of the facts connected with the Siemens' deal.

The collaboration agreement with KWU and the proposed wide-ranging collaboration with Sienmens have been conceived during the last three years in response to certain demands placed on BHEL for the major effort planned in power generation. The planned addition of 18,500 MW of power generation capacity by 1983, to fill the serious lags of the Fourth and Fifth Plans, is a formidable task by any standards. India had merely 2,300 MW of installed power generation capacity in 1950. It has added 22,000 MW in the last 25 years — and that, too, by large-scale import of aid-financed equipment and by relying in the main on foreign turnkey construction arrangements. The largely indigenous and self-reliant addition to generating capacity now envisaged requires a corresponding build-up of a sound infrastructure in BHEL. What BHEL needs therefore is a massive and qualitative upgrading of its management and technological capability. The new inputs BHEL wants to secure, including its collaboration with Siemens, have to be judged in this light.

It must be remembered, too, that BHEL is already engaged in wide-ranging collaboration arrangements for a vast variety of product lines with countries ranging from the Soviet Union, West Germany, Czechoslovakia, UK, France, and the US to Swden. Some of these — where the technology offered has been fully absorbed or is no longer of value — have expired or will soon expire. The experience gained and the skills developed by BHEL in the process have enabled it to conceive and launch a major programme of modernisation and upgrading of technology. The outlay for its modernisation programme is estimated to be only a quarter of its projected annual production of Rs 1,200 crores. The upgrading process does not involve Siemens alone; but Siemens' would be associated with 37 per cent of BHEL's total operations. Even now, 19 per cent of BHEL's operations are in collaboration with the Siemens, so that the new collaboration arrangements would put another 18 per cent of BHEL operations within Siemens' ambit.

The collaboration, envisaged with Siemens or others such as Combustion Engineering of the US or Viers of UK, does not involve dismantling of any productive facilities set up earlier in collaboration with the USSR and Czechoslovakia. What is planned is to acquire and absorb technical inputs in certain critical areas for more optimal utilisation of existing facilities. The absorption of new technology for upgarding and modernisation of BHEL capability bears testimony to the growing maturity, self-confidence, and self-reliance among BHEL's workers, engineers, and managers — rather than to servile dependence on foreign help.

Take the Hardwar plant of BHEL which manufactures large-sized turbo-generators. What exactly is involved in the switch-over to Siemens technology and how is it being carried out? The engineers and managers in Hardwar point out that the project report for the phased introduction of KWU technology within the established facilities was drawn up by themselves and not by KWU. Again at Tiruchi, which is the most successfully operated units of BHEL specialising in boiler making and boiler house auxiliaries, the switch-over from Czech technology to Combustion Engineering of the USA has been on a similar basis. On these lines, too, the success of the Hyderabad plant in industrial turbines has been phenomenal.

In the present stage of maturity acquired by Indian technical capability, it is no longer necessary as in the fifties that projects be set up with hundreds of foreign personnel coming in to construct them and running them until they are followed by hundreds of Indian personnel who have been sent abroad for training. Indians have developed the capability and skills to read intricate documentation, interpret it, and apply it on their own. This does not involve exchange

of personnel on the earlier scale. An exchange of a few dozen of sepcialists on either side is more than adequate. However, an important condition for collaboration to work to our advantage without leading to dependence on the foreign collaborator is that indigenous R and D effort at the production level and at the corporate level should be strengthened.

In this respect, the record and performance of BHEL and its R and D personnel is impressive. The outlay on R and D in BHEL, which has been stepped up to Rs 19 crores a year, probably exceeds the combined outlay on R and D in all the other public sector industrial undertakings. But the performance of R and D in BHEL is not to be judged in financial terms alone. Its R and D has many specific successes to its credit. In the circumstances, collaboration with Siemens or any other foreign party cannot sap its capability but can help add to its technological muscle.

The need for this new method of collaborating for knowhow had begun to be recognised in the early seventies. It was under the direction of the late Mohan Kumaramangalam that first initiatives in this direction were taken, and a wide-ranging omnibus agreement was signed by what was then the CEDB of the Hinustan Steel and Gipromez of the USSR for the development of ferrous and non-ferrous consultancy and engineering services in the public sector in India. It is wrong to suggest, therefore, that an omnibus collaboration arrangement of the kind proposed with Siemens will be the first of its kind. The CEDB-Gipromez arrangement was even more wide-ranging and comprehensive, though it covered a different area of technological knowhow — project engineering and systems. The present deal with Siemens is essentially for product development and extends to related engineering systems and applications.

Moreover, the CEDB at about the time as it signed the broad- agreement with Gipromez enter- another deal with United Engi- the USA (now called Wean acquisition of technical for manufacture of cold roll- mills of steel plants. an extraordinary arrangement the CEDB (MECON) does not manufacturing facilities of its own, and this was easily an encroachment on the Heavy Engineering Corporation's area of work and responsibility. The HEC, on its part, was tied to Soviet technology in manufacture of steel plant equipment. The CEDB-Wean Engineering deal was obviously conceived to by-pass the problem posed by the Soviet presence in the HEC. But the Wean deal in the event did not become operational for many years, even though fixed annual royalties have had to be paid to the American company. It is only now being brought into active and fruitful play with the withdrawal of the cold rolling mill complex of the Bokaro steel plant from the overall Soviet collaboration for that giant project.

This is being done on the clear recognition that, while Soviet steel technology is of high class in respect of blast furnaces and steel making, it is not as good in the rolling and finishing lines. The switch, therefore, may improve Bokaro's efficiency. However, under the aid arrangement with the Soviet Union the entire cold rolling mill complex would have had to be imported, the arrangement with Wean United will transfer the manufacture of 50 per cent of the equipment for the mill to Indian engineering firms, including the HEC. Many of the heavy engineering facilities set up in the first stage of India's industrial development programme, with Soviet, Czech, or any other source of assistance, were essentially on turnkey basis. They did not have in-built arrangements for design and product development on a continuing basis. This has made for their quick obsolescence.

Outright purchases of required technological inputs can of course be introduced in our manufacturing and engineering facilities without wide-ranging collaboration arrangements, such as is proposed with Siemens and as distinct from the deal already clinched with its subsidiary the KWU for manufacturing large-size turbo-generators. This is an issue which has to be closely examined and technically apprised before the proposed agreement with Siemens is cleared.

It has been suggested in this connection that limited technical assistance, through specific product collaborations to cover gaps in BHEL capability, resorted to in past years, led to diversity of design, engineering and manufacturing practices. This created problems of combatibility among products, systems and software. A more systematic arrangement with one of the leaders in a particular line of manufacture may be useful to overcome these problems. The experience with boiler technology, for which BHEL-Tiruchi entered into an arrangement with Cobustion Engineering of the USA along lines now proposed with Siemens with a wider range of application, is often cited to elucidate the solution.

Why has Siemens been chosen in the present instance? According to those charged with the choice of collaborator, it was because Siemens offered the best bargain. The others — among them the General Electric of the USA — were willing to provide, against payment of royalties, designs and drawings off the shelf, but without access to their research and development, much less to future improvements of techology. As for the royalty fee, in addition to the lump sum payment of about $ 20 million in 10 years, BHEL will pay Siemens for the 15 years of the agreement 1.8 per cent on the turnover resulting only from products and systems *based on* Siemens technology — not, as is popularly misunderstood, on the entire turnover of BHEL. According to BHEL's management, the royalty payment compares very favourably to the world market rates, which are usually 3 to 4 per cent. Moreover, it will be subject to Indian taxes and its incidence will thus be even more moderate. It is suggested, however, that Siemens have been more accommodating than others because of their competitive interests in the international market against General Electric of the US. It is for this reason, again, that Siemens has also been willing to back up BHEL exports to certain markets.

While presenting this assessment of the proposed BHEL-Siemens deal in the wider framework of the need for modernising and updating the technology base of Indian industry, especially in the strategic public sector, it is necessary to caution that the BHEL management will have to maintain constant vigil to safeguard indigenous quality, self-reliance in management, and its own R and D effort. Too much stress on the export market and global competitive standards, have evidently developed in BHEL circles in the context of the proposed BHEL-Siemens arrangement — tendencies which have been strengthened by a call on BHEL to compete in globe tendering for power projects aided by the World Bank. Another wrong notion that seems to be gaining ground has to be countered is the regard for sophisticated technology in isolation from the environment in which it has to be operated.

Janata's Second Phase

Romesh Thapar

THE second phase in the Janata party's struggle to find some sort of cohesion is certainly entered. If the Uttar Pradesh chief minister was politically inept in dealing with secretive Jana Sangh/RSS operations within the ruling party, his colleagues in adjoining states might not be so naive. They know that they are pursuing a line which might yield major political dividends in the contest for 'hegemony' in the Janata party — that is if they can skirt the danger of open splits and a falling apart. The break-up of the Jana Sangh–BLD combination within the Janata party creates possibilities for new power alignments.

The Uttar Pradesh crisis has, in a sense, started the crystallisation of the crisis which has been building for over a year around the role of the urban-based Jana Sangh/RSS. This segment of the ruling Janata formation is more closely-knit than the other segments, is under a rather rigid chain of command, is secretive, and is prepared to be both aloof and extraordinarily patient in the business of entrenching itself, not so much in the Janata party, but in the system of governance. And it is based largely on trading interests.

When the Janata party came to power in 1977, as a result of a massive wave of indignation and revulsion which cut across party, caste and class divisions, there was considerable worry about the 'respectabilisation' of the Jana Sangh/RSS. The broken ranks of the Congress party and the CPI, compromised by their active involvement in the politics of Emergency, made warning sounds about this development, but the general feeling was to keep suspicions pending.

Role of RSS/Jana Sangh

The first recognition of the role of the Jana Sangh/RSS came with the exposures by the Socialists (Madhu Limaye, for example) and those sections of the BLD which formerly constituted the Swatantra party (Piloo Mody and those thinking like him). Within months, the Jana Sangh/RSS cadres were under orders to infiltrate the party and government machine, and to concentrate on recruiting members to the Janata party who would be decisive in inner party voting. Despite warnings, little was done to halt these activities. Nanaji Deshmukh and, later, S S Bhandari ruled the roast for the RSS.

The growing collision between Charan Singh and the Prime Minister diverted attention from these more significant trends. But various political formations testing Janata party attitudes became more and more wary of the Jana Sangh/RSS activity. Whatever leading spokesmen of the ruling party might say, it is clear that by the end of 1977, Muslim opinion was deeply disturbed by the Jana Sangh/RSS emphasis creeping into policy formulation and implementation in the northern States — appointments, text books, employment policies, language attitudes, etc.

Through 1978, the Janata party was unable to make any headway in the South for precisely the same reason. Apart from a complex of other factors, the South viewed the Hindi obsession of the Janata party as a direct reflection of the Jana Sangh/RSS influence. The Jana Sangh/RSS administration of the Capital, and its cultural crudities, were reported round the country because Delhi is a very sensitive microcosm of India. Here, the regional elites meet to fuse into a national elite. Federal postures are tested and re-tested. The Jana Sangh/RSS continued to emerge as an unsavoury formation interested in a dangerous network of hegemonies.

The Harijan upsurge to assert rights, and the brutal attempt to break it by the entrenched upper castes, created another layer of confusion. The focus shifted to the rural areas where the Jana Sangh/RSS was not active. The impression was created that this segment was not involved in the embarrassments over caste. Actually, the ambivalence of the urban Jana Sangh/RSS over the Charan Singh episode and his *kisan* obsession raised many eyebrows. Over the long months of the in-fighting, the original BLD–Jana Sangh/RSS compact was seriously eroded. By the time the Aligarh riots took place, Raj Narain was ready to denounce the RSS — and only the RSS. Obviously, in Uttar Pradesh the calculation was that a rift could be created between the Jana Sanghites and the RSS cadres.

The mystery that surrounds the Jana Sangh/RSS is quite simple to explain. There are straightforward Jana Sangh members, but the real elite carries an additional RSS card. It is this elite which controls the formations and lays down the strategic and tactical line. It is increasingly assumed within the Janata party that the Jana Sanghites and the RSS cadres are now no longer the 'comrades' they pretended to be. And, maybe, even within the elite leadership a few fissures are appearing. Witness the independent posturings of Atal Bihari Vajpayee, seen, of course, by some as carefully planned moves to create a smoke-screen around the reality.

The increasing pressure to compel the Janata party to take notice of the RSS component of the Jana Sangh and its sinister attempt to control the formation in various ways, including membership drives, is bound to express itself politically in the power alignments of the northern States. Raj Narain is certainly on the warpath against the RSS and in this effort he has the silent backing of large elements in the Janata party, and in the Congress and Communist bases. The factional outbreaks involving the Jana Sangh/RSS can no longer be dismissed as concerning only the ruling party in the North. The whole nation is concerned. And the RSS cannot be accepted as a 'cultural' manifestation.

'Industrial Unrest'

If many question-marks on the future of the Jana Sangh/RSS ideology are forming — and given a certain underlining recently by the President's trenchant remarks about attempts to force an artificial Hindi on the sub-continent — an equally explosive situation is developing around the law and order situation in the industrial areas of India. It has been allowed to deteriorate and has put the Left segments of Indian politics in the dock. The violence and blackmail which now characterise industrial unrest are a dangerous assault on the structures of democratic functioning. It does not need any profound understanding to realise that these tactics adopted by militant segments who are led by a strange assortment of 'outsiders'

and fundamentally unrepresentative of majority sentiment, will do irreparable damage to the TUs and land the country in the kind of crisis that authoritarians welcome.

For almost a year, we have been witnessing a rash of deliberate violence, described by our tame newspapers and magazines, as 'industrial unrest'. The fact of the matter is, and it needs to be recorded in detail, that the genuine industrial unrest has been seized upon by a gangster network, now linked to various political parties, to establish a kind of mafia presence. In the past, the Congress tolerated these trends. And, now, the Janata party is following suit

Nobody should blame the police. They are compromised and diverted by the politicians who seem to have become totally reconciled to working with goondas of various description. These goondas only know strong-arm methods. They cannot comprehend the difference between genuine TU activity, which gradually liberates the working force from the brutal calculations of cynical industrialists and their managers, and the blackmailing operations they are adept at. Increasingly, in their hands, the strike weapon has been interpreted as mob action, without priorities and perspectives.

It is a sad commentary on the state of our TUs that even serious cadres working in the industrial belts have, despite better judgment, surrendered to the tactics of the goonda. Ultimately after all, it is a competition in an activity which adorns the general populist performance of the politicians. Goonda violence in the industrial areas spills over into other areas through various techniques of demonstration and protest. The almost permanent *gheraos* of ministers' homes is a vivid pointer of what is in the offing.

The lazy, cowardly refusal to distinguish between what is industrial unrest and what is straightforward violence and crime — a general *malaise* affecting all our populist parties judging from the careful silence on the subject — was suddenly highlighted by the attack in Bombay on the Godrej family, one of the most enlightened of employers in India. The political silence continues for it comes naturally to our dishonest politicians, but a recognition of the problem has occurred.

If we continue to tolerate whatever goes on, we will be eminently successful in shattering what little morale is left in the police force and, for that matter, in the bureaucracy. Sitting in Delhi, one can feel the growth of a new culture in the secretariats, a culture which emphasises the need to look after one's own skin and to leave the mess to the politicians who create it. The Emergency-lovers are licking their chops; it's what makes their tomorrows.

Goonda Politics

Of course, we also know that the goondas who are active in India's industrial and urban areas will be the first to shift loyalties and to offer their services to those who impose the authoritarian frame. The role of these goondas during the last Emergency is well known. It is ironic that the Janata party, headed by none other than Morarji Desai, is unable to deal them a blow from which they would find it hard to recover, for they are the grave-diggers of civilised government. We jog along imagining that the violence is democracy in action.

The complex Indian (read Hindu!) mind is in the habit of dismissing such arguments about our present state as simplistic. We are not like 'the odd Japanese' who vote out a prime minister by a postal ballot conducted by the ruling party. After all, we are still in the midst of negotiations between Morarji Desai, Charan Singh and Jagjivan Ram. These marathon talks can go on for ever, even after death, for there will be no dearth of revelations in instant memoirs. Simplistic systems are not our way — and that goes for the industrial unrest all over the country.

But at the same time, it has to be admitted that whatever the appearance of the daily newspaper these days, the fact remains that over the past weeks the Janata party does look as if it is settling down to a more ordered existence. The election victories against Congress combinations in Madhya Pradesh, and the quiet absorption of the once defiant Charan Singh, have helped. Indeed, even Morarji Desai is seen smiling in most pictures. It is a strangely mixed situation which needs careful sorting out.

The outcry against the activities of the Jana Sangh/RSS, justified publicly for the first time by a Union Cabinet Minister (that political dabbler, Biju Patnaik!), is not to be interpreted as marking another phase of disruption and disarray. Tangles between the parties making the Janata formation, and sections of a single party lost in the maze of new alignments, are to be expected. In such argumentations and collisions will the parties of tomorrow be formed — as also the programmes which are to take this country forward.

Monumental Absurdities

When we are not obsessed by the ruling Janata party, and have time to savour the in-fighting which grips the much-divided Congress and Communist groupings, we begin to realise that the political crisis is continental. The absurdities, too, are monumental. If opportunist Congressmen are afraid of unity, it is because (apart from other well known reasons) they feel that Sanjay Gandhi will land in jail and his mother might ask them (as an act of solidarity, no doubt) to do some jail-going. This is apart from loyalty rituals to Indira Gandhi herself. As for the CPI(M), to prove its ideological independence, it is planning a year-long salutation to Stalin. What next? Forgive the spectator, for such is the stuff of our political commitment these balmy days, but we are in the throes of change, Indian style.

The examples of monumental absurdity can be trotted out by the dozen. The CPI officially denouncing the authoritarian Indira Congress, but unofficially pushing a Moscow mandate to support the lady in her bid to re-unite the broken Congress. 'We shall now work from within', say the so-called progressives who were only the other day talking about 'a third force'. The silent and not-so-silent Socialists (allied, believe it or not, with the CPI-ists!) wanting 'immediate' commitments to a pro-Hanoi Kampuchea, if only to put a spoke in Atal Behari Vajpayee's movement Peking-wards. And so on......

The populist chatter of the Congress party is also repeated, and in familiar frameworks. There is talk of nationalisation without any effort to restore the people's faith in social control mechanisms and organisations. Despite healthy assertions about the need to dispense with luxury tourism and its damaging vulgarity, hotel collaborations designed to establish five-star infrastructures are sanctioned. The movement forward seems to be as rudderless as it has always been, despite the good intentions. Familiar is the word.

A parallel effort has begun to dissolve the pessimism, but all the state-

stics we can muster to prove that the economy is flourishing will not reassure the serious planner that we are secure. The rationing system is relied on and appreciated despite the functioning of the open market. Prices are holding for basic needs. Even the industrial picture is brightening. But declining exports, the importation of vast quantities of cooking oil and the expected disruption in petroleum supplies, and our inability to utilise effectively the foreign exchange reserves we now have with us, gets little mention. We are in danger of bluffing ourselves that coherent, intelligent political leadership is not really necessary after a certain level in development has been reached.

It is important to distinguish between the State's natural authoritarian capacity to harass and hamstring those who use their initiative to give India its economic momentum, and the State's vital role to restructure governance and to provide responsible perspectives for a just and meaningful society. We have been without proper guidance of many years now, guidance that can only come as a result of careful efforts to reach a maximum democratic consensus among the parties that reflect the strivings of the sub-continent. There can be no running away from this, whatever the crazy dreams of the free-wheelers.

New Consensus Overdue

Political controversies have to be lived with, but the ruling Janata party has not made any conscious or determined effort to set the dimensions of a new democratic and continental consensus about economic development or future political functioning This failure feeds the dissension and disruption within its ranks, and makes personality politics a central issue The troubles over the BLD and the Jana Sangh/RSS, the footling controversies over policy matters which are seen superficially as casteist or urban-rural confrontations, the demoralisation spread by banalities of all kinds, would be contained to a large extent if the Janata party forced itself out of its present drift. And, in so doing, it is possible it would influence other political formations.

It is easily forgotten that the fifties saw the making of a remarkable political consensus in India. It was eroded during the sixties and seventies, but the benefits accruing from it helped to cushion the shocks of those years. The making of a new consensus is long overdue, and it will involve tremendous preparatory effort because new interests have matured and demand attention. The peasant lobby in the North is becoming very articulate, and Indian communism is beginning to find roots in the East and in the South. Add to this the struggles against entrenched castes, and you have a full picture of the challenge as the second phase opens.

February 16

INTERNATIONAL AFFAIRS

Importance of being Non-Aligned

GPD

IN the face of a concerted campaign launched by such diverse forces as the Congress (I), CPI and the former Socialists within the Janata ably aided by one or two former Jana Sanghis, it looked a little uncertain if Atal Bihari Vajpayee could ultimately travel at all to the not so forbidden city of Beijing. And the outbreak of Sino-Vietnamese hostilities during his visit affected its significance in a very substantial way. The process of further normalisation of Sino-Indian relations has received a 'setback'. This 'setback', however, needs further examination.

The much debated 'China-game' has all the clitches. The questions one hears in New Delhi are, of course, the standard ones. They relate to what is known as 'playing the China card'. Some people see a big American game in the whole business. It is asked if Carter had not already sorted out the 'India-strategy' with Deng Xiaoping in Washington. In case this sounds too farfetched, one is reminded that there is a Sino-American axis against the Soviet Union and the Carters of the world are interested in getting the innocent bureaucrats of the South Block and the Janata politicians to join the bandwagon.

International politics is always cliche-ridden, and expert views on China are particularly so. How and why our China policy or policies should be burdened with such set formations is a mystery to me. In any case it is imperative that we clearly understand a few things about present-day China. The most important thing is to see clearly that it does not matter to India who China's Enemy No 1 is. It did not matter to us in the 1950s when US imperialism was China's greatest enemy. Nehru did not share China's view of the US then. It was not necessary to share the Chinese view of the world in order to be talking to China.

To say that the Chinese insist that everybody else should accept their world view before they can do business with them is to perpetrate the greatest hoax of modern international politics. They have not insisted so in the past; they have not done so now. For Nehru to whom independence in foreign policy essentially meant that people like Dulles and Gromyko were not going to choose his enemies for him, any such insistence on China's part would have seemed totally unacceptable.

Indeed, even as the Chinese repeatedly attacked US imperialism in those days, they did not at any time insist that India should share their view of US imperialism before they could do any business with it. Today the Chinese are saying a few nasty things about the 'social imperialists' in Moscow. There is no doubt also that they would like other countries to share their view of the erstwhile socialists. But it is simply not true to say that 'being anti-Soviet' is the condition on which the Chinese offer their friendship. Almost everyone doing good business with the China is doing equally good business with the Soviet Union. The number of the champions of the detente in Europe has not declined since the Chinese launched their offensive in the West. In fact the social democrats of West Germany excel in the game of playing the Ostpolitik without once letting the China-business suffer.

Why would India alone be expected to view the world as China does before the Chinese actually agree to do any business with us? Can it be that the learned people in New Delhi do not know that the whole world is merrily doing business with both Moscow and Beijing?

It seems that this is not a case of ignorance, the controversies raised over Vajpayee's trip are in reality aimed at committing India more firmly to the course Soviet foreign policy has been taking in recent years. Basically the debate has very little to do with China.

It is true that Chinese views on Soviet policies make it appear as if any position that India might take *vis-a-vis* the Soviet posture in this part of the world may appear to be a case of a concession or the lack of it to Chinese susceptibilities. But this is a patently wrong and even contentious way of putting this problem. The question, simply put, is: whatever our view of China, is it really in India's interest to endorse the new Soviet line of 'liberation by intervention'?

The answer is no. The superpowers are distinguished by the burden they seem to carry of creating in the states of the third world governments which will do what the superpowers will ask them to. On this question, a return to Nehruian perspective is absolutely necessary. The strength of Nehru's non-alignment lay in the fact that he was critical of just such an effort on the part of the US as far as Asia was concerned. Today the Soviet Union seems to have assumed that responsibility. Having itself established a working relationship with US imperialism, it seems to hold the view that the rest of the underdeveloped world should be be the ideal anti-imperialists. This basically means that when Brezhnev or Gromyko deal with the US, it is all to the good of humanity; but when Deng Xiaoping does the same, somehow world peace is in mortal danger.

It is important that in devising a China policy India must keep clear of these pressures. One does not have to call the Soviet Union 'hegemonist' or 'social-imperialist'; at the same time we must assert that the present distribution of power in the world is heavily against the interests of the third world. The first step in the effort to correct the unjust distribution of power is to be prepared to incur a slight displeasure of the superpowers. (And it can be no more than a slight displeasure.) Imperialism cannot be opposed without opposing 'liberation by intervention'.

In short, there is or can be a point of convergence in the Chinese and Indian world views. The Chinese are not so unrealistic as to assume or insist on a complete identity of views. But there is a lot to talk about with them even without such an identity. It is against such a background that the present ministerial contact between China and India has to be examined.

What is the stand of Indian political parties on the question of closer relationship with China? The Janata party is divided on the question. The Congress (I) has no particular views on the matter except to suggest that whatever the Janata foreign minister does must, by definition, be reactionary. If the trip to Beijing had been undertaken during Indira Gandhi's regime, it would have been, naturally, the right thing to do. The views of the Congress opportunists masquerading as progressives and nationalists need not be taken very seriously. The CPI must be the only communist party in the world opposing closer ties with a socialist state. It will not be long perhaps before it will start advocating closer contacts with the regime on Taiwan. Its moral indignation at what the Chinese have done to the Vajpayee visit only underlines its readiness to grap any stick to punish the Vajpayees of the world for seeking closer ties

with a socialist state which is a shade sceptical of the *Soviet Union! Strange* are the ways of the CPI. The Sino-Vietnamese hostilities break out and they are elated. Such is the measure of their bankruptcy. The Soviet Union and China throw proletarian internationalism to the winds and the CPI comrades take to the streets to applaud and condemn — as the case may be. What they seek to achieve by such gimmicks in less than honourable company is beyond one's comprehension.

The Chinese could perhaps have undertaken their punitive mission about fortyeight hours later, after Vajpayee had concluded his visit. Having said that one must also ask whether India wants or does not want improvement of Sino-Indian relations. The Madhu Limaye wing of the Janata and the CPI seem to suggest that this *is not possible*, or even desirable. Limaye has referred to the border dispute more than once. The Prime Minister too has stated that the Chinese must vacate their 'aggression' before everything else. Why the Prime Minister had to say it before his foreign minister took off for Beijing was never made clear. His statement *was in many ways reminiscent* of Nehru's remarks that he had given instructions "to throw the Chinese out".

It is time to consider afresh if the further normalisation of Sino-Indian relations has to be linked to a satisfactory settlement (from the Indian point of view) of the border problem, or whether one should consider the problem the other way round. To begin with, the *question is* wrongly posed. Any realistic assessment of the Chinese position would show that there is no question of China agreeing to a major revision of the *de facto* alignment of the border — now or in future. It is, of course, possible to get minor adjustments made; it is also possible to persuade China to make a concession in some area other than *Aksai Chin. But* it is not possible, through negotiations, that is, to persuade China to vacate 'aggression' in the Ladakh area. ... a realistic recognition should be the starting point of India's China

The crux of the matter is that the present state of Sino-Indian relations puts serious limitations on Indian foreign policy. The Vajpayee visit was a first step towards removing some of them. With the guns booming on the Sino-Vietnamese border, this step received a serious setback. Perhaps the timing was wrong. However, 'wrong timing' and 'wrong policy' are not the same thing, though the cacophony of 'national humiliation' is intended to *confuse* the two.

China thinks globally and acts globally. During the days of Jawaharlal Nehru and Krishna Menon, India too was active on a global scale. The question is how India can recover the same freedom of action and thought in international politics. One of the many ways to obtain it is to move towards a working relationship with China. This objective cannot and should not be given up.

The Sino-Soviet cold war, occasionally getting hot as in Kampuchea and Viet Nam, is a major phenomenon of today's world politics. It is important that India is non-aligned in this war. A concerted effort by the old and new (and at times strange) friends of the Soviet Union is being made with a view *to forcing* India to give up that non-alignment. This is not a new phenomenon. There were any number of partisans active in the early 1950s when the Soviet-American cold war was the principle feature of international situation and who wanted India to adopt a partisan posture and give up the freedom of action that it had. It was important then to be non-aligned in the Soviet-American cold war; it is important now to be non-aligned in the Sino-Soviet cold war. You cannot be active in Southeast Asia by just condemning Chinese action in Viet Nam without being equally forthright on the Viet Nam-Soviet action in Kampuchea.

It is even more important that India's expressed sympathies with Viet Nam do not land it in the lap of the Soviet bloc, so to speak. Nehru was quite unhappy and critical of Soviet action in Hungary in 1956; but he took care not to let the then vocal champions of Hungary to force him into the American camp. There are obvious differences between Hungary and Viet Nam, but in terms of bloc-politics and the power game there are scarcely any. Further, the socialist states have demonstrated time and again how capable and competent they are in the age-old power game. There is no reason why India alone should not cultivate such skills.

'Encounter' Murders in Punjab

IN response to the requests of various mass organisations in Punjab, the Punjab Civil Rights Committee was set up in October 1977 to gather facts about deaths of alleged Naxalites that are said to have occurred during so-called 'encounters' in the Punjab. The Committee is headed by V M Tarkunde, General Secretary, Citizens for Democracy and working President of the Peoples' Union.

The Committee initially took up for investigation the cases of eight persons who were alleged to have died in 'encounters' with the police. On the basis of evidence gathered by it the Committee has come to the conclusion, in its first interim report, that each one of these eight men was murdered by the Punjab police. None of them died in an 'encounter'.

The Committee has received evidence from relatives and close associates of the victims, from villagers who were direct witnesses to the happenings as well as from individuals who held important official positions in the localities in which the killings took place. The evidence it has received covers the following stages: first, it received evidence from individuals who saw the victims being taken into custody by the police; second, from individuals who saw the victims while they were lodged in police custody; third, from individuals who saw them being taken to the spot where they were killed; fourth, from individuals who actually saw the victims being killed; fifth, from individuals who had an opportunity to examine the bodies closely before they were cremated. In one instance it also received evidence from a witness who saw the body being off-loaded from a truck at the spot where the victim, it was later said, died in an 'encounter'.

The evidence taken together clearly establishes that each of the victims was in police custody before he was killed. The evidence also establishes that the victims were killed in cold blood, when they were unarmed, and after they had been brutally tortured. In two of the eight cases evidence suggests that the bodies bore no bullet marks at all. These individuals died entirely as a result of torture. The remaining six were shot outright.

In each of the instances, relatives and associates of the victims as well as other residents of the villages petitioned at various levels of the state and Central governments urging them to institute judicial enquiries into the deaths. In each instance the requests were turned down.

Below the Poverty Line

V M Dandekar

IN order to determine the shares of the states in the divisible pool of excise, the Seventh Finance Commission (1978) decided to give equal weight to (a) population, (b) inverse of the per capita State Domestic Product, (c) percentage of the poor, and (d) a formula of revenue equalisation. Direct cognisance of the poor is a particular innovation of the present Finance Commission. Reportedly, the Planning Commission also intends to incorporate it in its formula for distribution of block Plan assistance to states. Thus the estimates of the number of poor which have received so much academic attention since 1970, have suddenly become alive and operational. It is important therefore to examine a little carefully how the Finance Commission estimated the number of poor in different states.

In this matter, the Finance Commission was advised by one of its members, Raj Krishna, who is also a member of the Planning Commission. The method evolved by him is given in Appendix IV.9 of the Finance Commission's Report (pp 209-221). Partly because of differences in consumer behaviour and partly because of differences in the prices of essential consumer goods and services in different states, the poverty line, however defined, differs in different states. Hence, the starting point of the exercise is the determination of the state-specific poverty lines Raj Krishna chooses to determine them for the year 1960-61 and then bring them up for 1970-71. Here, we shall primarily concern ourselves with the procedures by which Raj Krishna determines the state-specific poverty lines for 1960-61.

Raj Krishna does this in two steps: (a) choosing an all-India poverty line; and (b) converting the all-India poverty line into state-specific poverty lines for different states. For (a), Raj Krishna adopts the Dandekar-Rath all-India norm of Rs 15 per capita per month for the rural areas and Rs 22.5 per capita per month for the urban areas at 1960-61 prices. We might note that Dandekar-Rath arrived at their national norms on an analysis of the consumer expenditure data from the 16th Round of the National Sample Survey (July 1960-August 1961) showing that it was at the per capita monthly consumer expenditure of about Rs 15 in rural areas and Rs 22.5 in urban areas that households on an average seem to have a diet adequate in calories, namely 2,250 calories per capita per day. On the basis of similar data from the 17th Round of the National Sample Survey (September 1961-July 1962) they had also indicated that corresponding levels of per capita monthly consumer expenditure were different in different states (Tables 1.5 and 1.6 of Poverty in India). A little additional work on these results of Dandekar-Rath could have given Raj Krishna the state-specific rural and urban poverty lines for 1960-61 which he was seeking. He could have also applied similar methods to consumer expenditure data from the later rounds of the National Survey such as the 25th Round (1970-71), the 26th Round (1971-72), the 27th Round (1972-73), or the 28th Round (1973-74) and obtained directly the state-specific rural and urban poverty lines for these later years. But, for reasons which are not clear, Raj Krishna chose to adopt more roundabout methods. He employs two different procedures, one for the rural areas and the other for the urban areas. We shall first examine *his procedure for* determining the state-specific rural poverty lines for the year 1960-61.

In order to convert the all-India rural norm of Rs 15 per capita per month at 1960-61 prices into state-specific poverty lines at 1960-61 prices, Raj Krishna utilises the state index of rural consumer prices in 1960-61 prepared by Bardhan on the basis of a study by Chatterjee-Bhattacharya (*Sankhya*, Series C, Vol 36, pp 275-279 and pp 337-367). The latter is a study in inter-state variation in consumer prices. It is based on the 18th Round of the National Sample Survey (February 1963-January 1964) rural household consumer expenditure data. Chatterjee-Bhattacharya utilise these data both for (i) estimating the average prices of 56 consumption items in different states, and (ii) for obtaining the corresponding weighting diagrams, that is the commodity composition of the consumer expenditure in different states, and then proceed to construct, for each state, a consumer price Fisher index with all-India prices taken as base = 100.

A special feature of the Chatterjee-Bhattacharya study is that they construct the index numbers for inter-state comparison of consumer prices not only for the entire rural population but for its quintiles, that is 20 per cent sections, when arranged in an ascending order of per capita consumer expenditure; thus the first quintile comprises the bottom 20 per cent rural population in each state. Bardhan in his 'Study on Incidence of Poverty in Rural India' uses the Chatterjee-Bhattacharya indices for the two bottom quintiles that is the bottom 40 per cent of the rural population in each state. He averages the two index numbers for the two bottom quintiles as constructed by Chatterjee-Bhattacharya on the basis of the 18th Round of the NSS (February 1963-January 1964) and regards them as *valid for 1960-61. Then taking* "Rs 15 at all-India rural prices and multiplying by the corresponding index for each state" Bardhan gets "the cost in each state of the consumption basket represented by Rs 15 at 1960-61 all-India rural prices". Finally, to convert them into costs at 1967-68 prices, that is "the cost in each state, at 1967-68 prices, of the consumption basket represented by Rs 15 at 1960-61 all-India prices", Bardhan raises them by the consumer price index numbers for agricultural labour (July 1960-June 1961 as base) for different states issued by the Labour Bureau.

Raj Krishna follows Bardhan. He borrows from Bardhan's study the "costs of consumption basket represented by Rs 15 at all-India rural consumer prices in different states in 1960-61", adopts them as the state-specific rural poverty lines at 1960-61 prices, and raises them by the consumer price index numbers of agricultural labour for different states in 1970-71 to obtain the state-specific poverty lines at 1970-71 prices.

The Chatterjee-Bhattacharya study is a careful piece of work and the authors are aware of the limitations of the index for inter-state comparison of consumer prices. For instance, they observe: "Inter-regional comparisons such as those carried out here are of obvious interest, but there are well-known methodological problems which can hardly be overcome with satisfaction (Beckerman, 1966) Thus, no attempt has been made in the present study to allow for variation in consumer preferences arising due to climatic and other environmental factors." (para 1.4, p 338). Further: "The first point to note ... is the appreciable divergence between Laspeyres and Paasche indices

in a large number of cases. ... the divergence tends to be wide when the budget pattern of the state considered is very different from the over-all pattern in rural India and fairly small when the state budget pattern is not so different from the pattern observed in rural India. Glaring instances of this effect are visible ... This is, of course, understandable. While we may quote the Fisher indices for measuring inter-regional price differentials, the measurement is far from precise when the two regions have markedly different household budget patterns" (para 3.2 p 343).

This indeed is the essence of the index number problem, namely the inherent difficulties of making a comparison between price differentials, whether temporal or spatial, when the budget patterns are different. When index numbers are used for comparison over time, as is more commonly the case, the base period is periodically brought forward so that the difference between the budget patterns in the base year and the 'current' year are not too large. This is not possible when the index numbers are used for inter-regional comparisons. It is neither possible to reduce the differences in the budget patterns of two regions when they exist nor is it possible to allow for them in the index number. It is best to recognise, as Chatterjee-Bhattacharya do, that the inter-regional comparison by index number is not satisfactory when there are large differences in the budget patterns of two regions.

Bardhan does not show equal awareness of these problems. Indeed, he seems to believe that "taking Rs 15 at all-India rural prices and multiplying by the corresponding index for each state" derived from Chatterjee-Bhattacharya study, he gets "the cost in each state of the consumption basket represented by Rs 15 at 1960-61 all-India rural prices". Strictly speaking, the phrase "the consumption basket represented by Rs 15 at 1960-61 all-India rural prices" is not meaningful because 'Rs 15 at 1960-61 all-India rural prices' can represent any number of consumption baskets many of them widely different in their commodity composition. Presumably, what Bardhan means is 'consumption basket with a commodity composition as it obtained on an average in the 40 per cent bottom all-India rural population in 1963 (Feb 1963-Jan 1964) and valued at Rs 15 at 1960-61 all-India rural prices'. Thus interpreted, Bardhan is not quite right in his belief that what he has is the cost in each state of such a fixed consumption basket at 1960-61 rural prices. This would be true if he were using Laspeyres' index number. With Fisher index, the consumption basket is not fixed. It is some kind of an average of the consumption basket as it obtained at the all-India average and in the respective state. The basket of comparison is thus not the same for all the states. Of course, it should not be the same. In determining poverty lines in different states, it is necessary to make due allowance for the differences in the consumption basket in the different states. The Fisher index and for that matter any index, cannot do this. In short, by resorting to this roundabout method of determining the state-specific poverty lines, while one may display a great deal of statistical sophistry, one does not know what one is in fact doing.

Chatterjee-Bhattacharya also make a reference to an earlier study by Rath (1973) which employed broadly similar data and similar method as their own. They make the following comments: "... Rath (1973) employed NSS 17th Round (September 1961-August 1962) budget results including estimates of average price and per capita consumption (quantity) of 44 items for the rural areas of different states. Laspeyres and Paasche indices were computed for comparing the price levels for the general population in every pair of states. The indices with different states as base were then averaged to get an overall picture... There are striking differences between these results of Rath and those obtained in the present study, although the two studies utilised data from two consecutive rounds of the NSS" (para 6.3, p 366).

It seems that, in the judgment of Chatterjee-Bhattacharya, the following circumstance was responsible for the differences in the results of Rath and their own results. They say: "A crucial step taken by Rath was the treatment of each of the following groups of commodities as single items: (i) cereals and products, (ii) pulses and products, (iii) vegetable oils and vanaspati, (iv) meat, fish and egg, and (v) tea and coffee. (The number of items representing these groups in our calculations are, respectively, 8, 5, 5, 5, and 3.) Rath took this step primarily because some of the constituent items did not feature at all in the family budget of a number of states, so that all the 44 prices were not available for every state. To our mind, this problem is not as serious as made out by Rath; and our method of substitution was not applied too frequently to overcome this problem. On the whole, Rath seems to have exaggerated the relative price levels in the rice- and wheat-consuming states and under-stated the relative levels of average PCE (per capita consumer expenditure) in real terms in these states. His picture of regional variation in the 'poverty line' also seems to be exaggerated."

It is not the intention here to go into a detailed enquiry into the differences between the results of Rath and Chatterjee-Bhattacharya. The important point to note is that competent analysts, such as Chatterjee-Bhattacharya and Rath, working on comparable sets of data and with methods basically not dissimilar and in any case methods which *prima facie* appear reasonable and which can be justified on one or the other analytical ground, come out with results with strikingly large differences. Evidently, the method is susceptible to minor changes in the choice of commodities, their groupings or substitutions.

We might make one final comment. Having obtained the state-specific poverty lines at 1960-61 prices, in order to bring them up to 1970-71 prices, Raj Krishna, following Bardhan, raises them by the consumer price index of agricultural labour issued by the Labour Bureau. We might note that, though this index has 1960-61 as base, its weighting diagram is derived from the family budget data of the Second Agricultural Labour Enqiry (August 1956-August 1957).

To sum up, in spite of the impressive statistical sophistication borrowed from Burdhan, the state-specific rural poverty lines derived by Raj Krishna are devoid of any clear meaning and moreover are susceptible to minor changes in the method so that one could produce quite different results by adopting methods which are only slightly different and are equally justifiable. One wonders why he adopted this procedure when, following Dandekar-Rath, he could have derived the state-specific poverty lines for 1970-71 or even for a later year such as 1972-73 or 1973-74 directly from the corresponding data from the National sample Survey.

But all this is excusable, or even permissible, when we compare it with the procedure. Raj Krishna resorts to for determining the state-specific urban povery lines. Chatterjee-Bhattacharya did not extend their study of inter-state price differentials to urban consumer prices and hence Bardhan did not extend his study of the Incidence of Poverty to urban India. Consequently, when it came to determining the

TABLE A

State (1)	Consumer Price Index for Working Classes (1960-61=100) Average for 1961-63 (2)	State-Relative Urban Price Index with All-India Average=100 (3)	State-Specific Poverty Line 1960-61 Urban (4)
Madhya Pradesh	110 45	103 22	23.22
Maharashtra	103 62	96.84	21.79
All-India	*107 00*	*100 00*	22 50

state-specific urban poverty lines, Raj Krishna had to rely on his own resources which, as the results show, proved inadequate.

Raj Krishna notes. "For converting the urban all-India norm, no state-relative price index is available" Hence, he proceeds to utilise "the three year (1961-63) average of the working class consumer price index". The data given in Table A illustrate the procedure

The implict argument runs as follows: The Consumer Price Index for working classes shows that while the average all-India urban price level in 1961-63 was 107 00 per cent of 1960, the same in Maharashtra was 103.62 per cent and in Madhya Pradesh 110.45 per cent (col 2). Hence, in 1961-63, the urban consumer prices in Maharashtra *were 3 16 per cent below the all-India* prices and in Madhya Pradesh they were 3.22 per cent above the all-India prices (col 3) Now, Bardhan had treated results based on 18th Round of the National Sample Survey (Feb 1963-Jan 1964) valid for 1960-61 Hence, the above results (?) for the period 1961-63 may certainly be regarded valid for 1960-61 It follows that, following Dandekar-Rath, if we place the all-India urban poverty line at Rs 22 5 in 1960-61 urban prices, the cost of the same consumer basket and hence the urban poverty line would be Rs 21 79 (3.16 per cent below the all-India norm) *in Maharashtra* and Rs 23.22 ... per cent above the all-India norm) in *Madhya Pradesh* (col 4).

Clearly, the second step in the above ...ment, leading from column (2) to ... (3) is a bad slip. What we have ... column (2) is a comparison over time ... consumer prices in each state ... *average of 1961-63* com... average of 1960-61 in each ... all-India. Raj Krishna slips ... believing that it also gives an ... comparison of urban con... prices in 1961-63. In the next ... when he regards this inter-... comparison also valid for 1960-... a moment's reflection would have suggested to him another equally valid procedure leading to quite another yet equally valid *result*, he could as well have made such an inter-state comparison of urban consumer prices in 1960-61 directly on the basis of the consumer price index in that year and come to the conclusion that the urban consumer prices in 1960-61 were the same in all the states How? Because the consumer price index in that year was the same =100 in all the states! Raj Krishna does not see that, that indeed is the implication of his second step

If it were merely one of Raj Krishna's academic writings in which the error had entered, we would leave the matter there Unfortunately, the matter is a little more serious The error has entered the report of the Finance Commission and reportedly may enter the Plan allocation to states being made by the *Planning Commission involving crores* of rupees We hope Raj Krishna will take immediate steps to rectify the error.

There is a larger question involved: how much academic sophistication to permit in operative decisions of government On closer examination, it is found that most often neither the underlying concept such as poverty nor the data such as coming from the National Sample Survey can bear much of the academic sophistication in which academicians often indulge. Nevertheless, such sophistication is legitimate in academic exercises which in their nature are exploratory. But it is clearly dangerous when academicians enter the field of operative decision-making without realising the exploratory and speculative character of much of their past academic work on which their present reputation often rests. With increasing computer facility, the danger today is *real In the particular case, we should* be grateful that the exercise was simple and the error could be easily seen. But suppose Raj Krishna had erected a simulation model of the Indian economy, which he is undoubtedly capable of, with v-variables, p-parameters, s-sectors, l-linear and m non-linear constraints, interfaced with an independent technological-choice model subject to certain environmental optima, dynamised to oscillate stochastically between a finite and an infinite horizon and, with inputs from the National Sample Survey and other relevant sources, had fed it into the computer that now rests in the Planning Commission, we would have been all awed by its output and surrendered to its decisions on distribution of the divisible pool of the excise and the block Plan assistance to the states If academicians are not to lose some of their reputation in the Finance Commission and the rest in the Planning Commission, they must wake up to this danger.

Changing Approaches to Population Problems

THE Development Centre of the OECD, in co-operation with the World Bank, has just published a book "Changing Approaches to Population Problems" which examines how the approach to population problems and ways of dealing with them have changed since the World Population Conference in Bucharest in August 1974. The book, written by Margaret Wolfson of the Development Centre, is based on the results of direct discussions in twelve poor countries and with the *principal agencies providing population* assistance. Whereas in Bucharest the issue of population versus development split international opinion into two violently opposed camps, now the need for the dual approach of population and development has become accepted as the conventional wisdom.

In an Overview chapter, which analyses the findings of the survey, the author points out that the Bucharest Conference brought to the fore the enormous complexity of the population issue and put to rout the earlier simplistic notion that 'population' was primarily a matter of numbers or rates of demographic growth. She notes that even those countries concerned about the problem of rapid population growth have repudiated family planning as the main solution in favour of a broader development effort and an 'attack on poverty'.

The conclusion that emerges from the book is that the relation of improved economic and social conditions to such problems as high infant mortality, uncontrolled urban growth, or massive unemployment among the young, is now well understood by both developing countries and the donors of aid. In particular, it is recognised that the social status, education and earning opportunities of women play a fundamental part in determining family size.

Future of Indian Caste

M N Srinivas

The caste groups which are emerging in urban areas and which are in competition with each other for obtaining access to power and resources bear very little resemblance to traditional caste in rural India.

As against this, even today agricultural production requires the co-operation of several castes, and even traditionally competition between different castes did occur though it was not very common. The use of the caste idiom is widespread, though the idea of hierarchy is being increasingly rejected by those groups traditionally confined to the bottom.

There are continuities and discontinuities, and social anthropologists have to reconcile themselves to work in fuzzy areas where not only are boundaries not clear but multiple and contrary forces are at work.

I

IN discussing caste, I shall be making a broad distinction between traditional and modern caste which roughly coincides with the distinction between the pre-British period on the one hand and British and post-British period on the other. Pre-British caste was very largely rural, though cities have been a feature of Indian culture since the days of Harappa and Mohenjodaro. But pre-British cities were very few, and they were quite different from modern cities. But even today 80 per cent of the population live in villages, and it is expected that even in the year 2000 AD, 70 per cent of Indians will be living in villages. But the links which exist today between villages and towns are many and intimate, and they have to be studied in relation to each other. Poor immigrants from rural areas perform a variety of semi-skilled and skilled jobs in urban areas and populate the slums which lie cheek by jowl with more prosperous areas. The rural poor articulate a different network to have access to various resources including education and urban jobs. While the middle classes regard villages as generally recipients of forces from urban areas, it is well to remind ourselves that it was the villages of north India who threw out the Congress and brought in the Janata at the general elections of 1977.

I shall first consider briefly rural caste. I shall do this by presenting its main features as they were described by Edmund Leach[1] in a thought-provoking introduction to "Aspects of Caste in India, Ceylon and North-West Pakistan" (Cambridge, 1960). The introduction also includes Leach's evaluation of the changes which have occurred in caste in the twentieth century and that is also relevant for my purpose. I shall state Leach's arguments in his own words especially as I differ from him radically on some points.

Leach regarded 'dominant caste' as a universal and integral element in the rural caste system. According to him, the members of the dominant caste not only owned land but enjoyed numerical majority over the others. Leach also assumed that in pre-British India, land-owners competed among themselves for the labour and services of the other castes, and since caste was inseparable from if not inconceivable without a system of hereditary division of labour, the grouping of people into different castes forced them to co-operate with each other for performing basic economic and social tasks. The interests of the different castes therefore necessarily converged. Going further, he argued that competition between members of different caste was uncharacteristic of the system and wrote,

> ... it is precisely with these inter-caste relationships that we are concerned when we discuss caste as a social phenomenon The caste society as a whole, in Durkheim's sense, is an organic system with each particular caste and sub-caste filling a distinctive functional role. *It is a system of division of labour from which the element of competition among the workers has been largely excluded* The more conventional sociological analysis which finds an analogy between castes, status groups, and economic classes puts all the emphasis on hierarchy and upon the exclusiveness of caste separation. *Far more fundamental is the economic interdependence which stems from the patterning of the division of labour which is of a quite special type*" (p 5, emphasis mine).

Leach then proceeded to distinguish between caste and class:

> "It is a characteristic of *class*-organised societies that rights of ownership are the prerogative of minority groups which form privileged elites. The capacity of the upper-class minority to 'exploit' the services of the lower-class majority is critically dependent upon the fact that the members of the underprivileged group must compete among themselves for the favours of the elite. It is the specific nature of a *caste* society that this position is reversed. *Economic roles are allocated by right to closed minority groups of low social status;* members of the high-status 'dominant caste', to whom the low-status groups are bound, generally form a numerical majority and must compete among themselves for the services of individual members of the lower 'castes'" (pp 5-6, emphasis mine).
>
> In a class system, social status and economic security go together — the higher the greater; in contrast, in a caste society, status and security are polarised... In a class society the 'people at the bottom' are those who have been forced there by the ruthless process of economic competition; their counterparts in a caste society are members of some closely organised kinship group who regard it as their privileged right to carry out a task from which all other members of the total society are rigorously excluded (p 6).

Leach concluded by declaring categorically that

> wherever caste groups are seen to be acting as corporations in competition against like groups of *different caste,* then they are acting in defiance of caste principles (p 7).

I shall now elaborate on a few points made by Leach. In the first place, it should not be forgotten that he has in mind traditional or pre-British India. The population of India even around 1820 was about 120 million which is a far cry from the 630 million or so of today.[2] This meant that labour and skills were scarce relative to land. The so-called low castes had a monopoly over their traditional occupations Even as recently as 1947, I noticed in Rampura village in old Mysore State a sense of pride in the ancestral occupation and in the fact that the skills involved in its practice were esoteric and not available to outsiders.[3] The right to provide priestly services to a group of villages was treated as if it were real property subject to be alienated tempa-

rarily or permanently, or divided among heirs. A dominant or other high caste leader who founded a village or chiefdom was obliged to invite members from the artisan, servicing and labouring castes with offers of land and other incentives in order to make the village of chiefdom viable. Further, every group of villages had its own weekly market which provided a venue for its surplus, and also enabled it to buy or exchange the goods it wanted.

It is true that the landowner was regarded as the *yajaman* or patron, superior in wealth and status, to those who worked for him, but patronship in traditional India did not only confer rights but carried with it onerous duties towards clients. The term 'patron' has acquired a bad odour in the last thirty years or so but this is due to concentration on the "exploitative aspect" of patronship while at the same time ignoring its protective aspect.

Inter-caste interdependence was frequently reinforced by factionalism. The village patrons were generally in a relationship of mutual rivalry but that did not prevent them from coming together to form a faction against a similar combination of patrons. Each patron carried his clients with him into his faction. While the membership of factions was unstable, factionalism itself was inseparable from rural life. Factions were generally multi-caste in composition but the degree of mix of the local castes differed from faction to faction depending upon a variety of factors which it is not necessary to go into here.

I shall now mention the drawbacks in Leach's view of rural caste. Leach's assumption that there is everywhere a dominant caste enjoying numerical majority over the other castes, lacks empirical support. Its applicability to traditional India is even more doubtful, for in many parts, the landowners frequently came from ritually high status castes such as the Brahmins and Kashatriyas, and were sharply distinguished from the dominant peasant castes. One of the major results of land reform has been the transference of land from the ritually high status castes to the dominant peasant castes which had a tradition of agriculture and lived in rural areas. The dominant castes, which are, incidentally, among the biggest beneficiaries of Independence, were able to escape the more lethal effects of land reforms because of their hereditary occupation, and their tendency to live in extended kin groups. The ritually high status castes, in contrast, frequently lived in urban areas, and provided a significant component of the absentee landowner class.

Leach assumes that every village had several castes including the dominant, but even today a majority of Indian villages have a population of less than 500 each, which means they probably do not have more than three or four castes.[4] Besides, all over the country there are to be found villages inhabited by single castes such as the potters, weavers, washermen, shepherds, fishermen, hunters and so on. The big, multi-caste villages occur largely in the prosperous irrigated areas.

Leach has described caste as it functions at the micro or grassroots level, and one would expect that it would have led him to a dynamic view of the institution for it is the intensive study of villages by social anthropologists that brought out the mobility inherent in the caste system as it actually operated in contrast to caste as it was conceived of in the sacred literature. The contrast between the 'book view' and the 'field view' is a profound but well-established one From the 'field view' of caste it can be inferred that the system provided for a certain amount of mobility, i e, while a few castes moved up or down, the system as a whole remained stable. A view such as this naturally leads one to investigate the sources of mobility and this in turn reveals the links between phenomena at the micro and higher levels. The micro-level view is a legitimate one for heuristic purposes but one cannot forget its links with phenomena at the higher levels or with historical events.

I have discussed at length the sources of mobility in the caste system elsewhere[5] and I shall rest content here with stating that there was fluidity at the lower levels of the political system in pre-British India which made it possible for leaders of dominant castes to capture political power at the villages or higher levels and become chieftains (*palegar, nayak,* etc). The possession of political power generally resulted in the possessor's claiming to be a kshatriya and further strengthening his claim by securing the services of genealogists and bards (Bhats, Charans and Vahivanchas), and of Brahmins. This was in turn followed by suitable alterations in the life-styles and ritual of the successful persons, a process which I have referred to as Sanskritisation. The Kshatriya category was the most open one in the caste system though it was much more popular in the North than in the South. It is my hunch that the categories of Brahmins and Vaishyas were also open though not probably to the same extent as the Kshatriyas. This view of caste makes each twice-born *varna,* or all-India caste category (derived from the 'book view'), at least in some cases the result of striving and achievement over long periods of time. (Bailey and others who described caste as "a closed system of social stratification" were guilty of totally ignoring the historical processes which went to make up local hierarchical systems.)

The frequent occurrence of protest movements against caste throughout Indian history, provided yet another source of mobility. These rebel sects rejected the ideas of Brahminical supremacy, the performance of elaborate rituals, and the punctilious observance of the rules of pollution and purity, and they instead emphasised the love of god and right conduct as indispensable to salvation. It is not surprising that the protest sects attracted followers from a wide range of castes from rebel Brahmins to untouchables. It is sad that in emphasising caste and hierarchy, we (that is, Indian scholars), have failed to take note of the significance of anti-caste and anti-Brahmin movements in Indian history. We have been like one-eyed camels concentrating on the fodder available on one side of the avenue while ignoring the fodder on the other side. *Caste and anti-caste are both part of a single phenomenon, and those who wish to root the idea of human dignity and equality in Indian soil would do well to go to these historical sources of protest and build on them.* But the pity of it is that our intellectuals are not only alien to rural India but are both contemptuous and patronising in their attitude towards rural people and their culture. Educating our intellectuals ought to be a task of high priority.

But the reason for my bringing in the protest sects is to show that they offered opportunities for mobility to members of the so-called low castes. There is ample evidence for this but the full sociological significance of the protest sects, has not yet been assessed.

It can now be seen that even traditionally competition between castes did occur in the struggle for power and for mobility. In the former case, it was necessary for the caste in question to

be numerically strong and have a tradition of fighting. Several castes besides the dominant peasant castes had both. Though at the village level the local sections of different castes — or, more correctly, households — co-operated for agricultural production and for pursuing social and cultural ends, competition did occur at the higher levels for seizing political power and for achieving mobility, and Leach's view that competition between castes is uncharacteristic of the traditional caste system is, in my opinion, totally wrong.

II

I have discussed the main changes which caste has undergone in modern India in my earlier writings, and I shall try here only to recapitulate a few significant points to characterise the nature of the changes which have occurred and their implications.

No account of the changes which occurred in caste during the British period can ignore the emergence of nationalism among the educated Indians in urban areas. But historians and political scientists until very recently have viewed nationalism only as it manifested itself at the highest level, and even there, have concentrated on its political aspects. But to a social anthropologist nationalism appears as a form of self-consciousness pervading the entire society, and sharpening identities at all the nodal points in the social structure. It is no accident then that the pervasive self-consciousness which nationalism produced affected caste also. It manifested itself in the attempt of the so-called lower castes to take over the customs, practices and rituals of the higher castes, and in their claiming high status for themselves in the local hierarchy. The decennial census had the unintended effect of providing opportunities to ambitious castes for altering their names and reporting myths in support of their claim to high status indicated in the new names. The 1901 Census was the high point in such deception as word got round that the Census authorities, which meant in effect the Government of India, was going to determine precisely the rank of each caste. (Sociologically speaking, this showed colossal misunderstanding of the nature of caste on the part of Risley and other British ICS officials. Nebulousness in mutual ranking is of the essence of caste system in operation as it is a precondition to mobility.)

People living in the big port towns and coastal areas perceived the importance of a knowledge of English and Western education for securing jobs in the new administration, entering the professions, and for commerce and trade. Access to education became crucial for secular mobility though eventually secular mobility had to be translated into caste terms. This was necessary for a variety of purposes including the connubial.

When the British started parting with power to Indians on an instalment basis, access to power replaced access to education in terms of its importance to mobility. Initially this meant seeking the favour of the British who were understandably interested in perpetuating their rule and in building defences against growing nationalism which they identified with educated babus or upper caste Hindus. It was understandable that under the circumstances the British should pursue a policy of lending their support to all minorities and vested interests, Muslims, Christians, Sikhs, Anglo-Indians, Scheduled Castes, Scheduled Tribes, Parsis and the princes. The results of British policy are now a matter of history but I would like to comment briefly on only one element of it.

In the south of India, for instance, caste quotas for government jobs and seats in educational institutions were introduced as early as 1920s. There was a strong feeling among the better off and more influential members of the non-Brahmin castes that the Brahmins who constituted a mere 3 or 4 per cent of the population had a near monopoly of higher education and government jobs and were over-represented in the professions. This view was strengthened by an anti-Brahmin ideology which made the Brahmin out to be an Aryan in contrast to the indigenous Dravidians, a representative of the imperial Sanskrit as against Tamil, and the author of the caste system. But when the nationalist movement became very powerful in the thirties, under Gandhiji's leadership, the leaders of the non-Brahmin movement joined the Congress.

Under the Constitution of Independent India, the Scheduled Castes and Scheduled Tribes have been given, in proportion to their numbers, reservation of seats in the legislatures at all levels, and jobs in the government, and seats in educational institutions. (Now reservation has been extended to promotions as well.) While reservation for Scheduled Castes and Scheduled Tribes is constitutionally guaranteed there is another category of castes called the Other Backward Classes (OBC), and it is left to each state to determine which castes, should be included in this category, and to take suitable steps for improving their condition. As I have said earlier, the southern states have a history of quotas for the backward classes, and since Independence, Karnataka, Kerala and Tamil Nadu set up commissions to review all aspects of backwardness and to suggest new measures to ensure that the benefits and concessions available to the backward classes reached the poorer castes subsumed under the OBC, and not monopolised by the more powerful ones. Karnataka, for instance, has distinguished between "backward" and "more backward" castes, whereas Kerala has used the terms, "backward" and "most backward" to make an identical distinction. It must be mentioned here that the OBCs are an extremely heterogenous category consisting at one extreme of powerful, landed and prosperous dominant castes, and at the other, of poor, artisan and servicing castes such as barbers, washermen, potters, basketry-makers, fishermen, etc. Karnataka, which is perhaps more radical than all the other states in the matter of quotas and concessions given to the OBCs, has used the twin criteria of caste and economic backwardness to determine who really are the disadvantaged. In Karnataka, nearly 60 per cent of seats in educational institutions, and jobs in the government are set apart under various categories, Scheduled Caste, Scheduled Tribe, OBC, offspring of defence personnel and of MPs, and physically handicapped candidates. The net result is that only 40 per cent of jobs and seats in educational institutions are open to merit.

While in the southern states the principle of caste quotas have been accepted for nearly six decades, they appear to be absent in the northern states except for the Constitutionally-guaranteed reservations for the members of the Scheduled Castes and Scheduled Tribes. The recent efforts of the Janata government in Bihar to reserve 30 per cent of the government jobs for the members of the Backward Classes has met with violent resistance from the higher castes. One of the reasons — only one, let me repeat — for the relative ease with

which the principle of caste quotas was introduced in the south was the high visibility of a small elite group which had benefited greatly from English education and which provided a focus for others to unite against. In the northern states, on the other hand, there is no such small elite, and the matter is further complicated by the presence of several numercially strong high castes who stand to lose from job reservation for the backward classes. If the latter turn violent, inter-caste fighting is likely to become an everyday affair.

I would like to comment here briefly on the recent and widespread occurrance of bloody fighting between caste Hindus and the Scheduled Castes. Such incidents have been reported from UP, Maharashtra, Tamil Nadu, and elsewhere. As a result of the various measures of "protective discrimination" adopted towards them, there has emerged everywhere small groups of educated Scheduled Caste youths who deeply resent the attitudes of the higher castes towards them. Some of this resentment has found expression in the writings in Marathi of the Dalit Panthers in Maharashtra, comprising educated Mahars who, or whose parents, became Buddhists in the 1950s following the leadership of the late B R Ambedkar, who ended his life long career of protest by becoming a cabinet minister at the Centre, and was one of the chief draftsmen of the Indian Constitution.

Besides the educated youth, all over the country there has been a sharp rise in the self-consciousness among the Scheduled Castes, and this makes them highly critical of the higher castes, and regard the benefits, concessions and reservations given to them under the Constitution as only a small acknowledgement on the part of the society of the grave injustice that it has done to the Scheduled Castes over the millennia. At the same time upper caste youths, who do very well in examinations but find that they are passed over for Scheduled Castes with lower marks for seats in highly competitive professional courses of study and for jobs, become bitterly anti-Harijan. I fear that they might embrace violent ideologies which promise to overthrow the existing order. No society can afford to alienate and embitter its most gifted elements, least of all a developing country such as India but then there is no easy way out of the cruel national dilemma between equality and excellence.

Given such diametrically opposed attitudes I envisage in the immediate future increased conflict between caste Hindus and Scheduled Castes in every part of India irrespective of the party in power. I am afraid the Indian road to equality is going to be marked by bloody clashes between different castes, though caste may to some analysts appear to be a "false" category unlike class.

III

During the last six decades or more, there is increasing realisation among the people that access to power is crucial for securing access to resources. But power does not only have an instrumental value: it is also valued as an end, a mystique, and recognition of any kind of achievement has to be by the government or its representatives. That is why the presence of a minister is thought to be essential to mark any important occasion or confer legitimacy on any kind of achievement. Even men in ochre robes like to be seen with men wearing khaddar, and vice versa. The way people fawn on the powerful, and the very next minute discourse on the hoary tradition of Indian spirituality is too common to deserve comment.

But the realisation of the cruciality of power did result in what may be called the coming together of cognate jatis or endogamous units to form caste conglomerates which acted as pressure groups in political and economic contexts. In a democracy, numbers mean strength and if in pre-British India, small groups of kin fissioned off from their parent groups for purposes of enhancing their economic opportunities, in modern India cognate castes have to fuse together to achieve power. If fission characterised traditional caste, fusion characterises modern caste. Cognate castes come together initially as a matter of political convenience but gradually marital links are established between leading kin groups in each constituent jati. In establishing such alliances, class and life-style factors are important. Thus an educated son from a peasant caste might not find a suitable bride in his original endogamous group and might be forced to seek a bride in a cognate jati. Since dowry has spread to peasant, and in some areas even to Harijan castes, consideration of the size of the dowry frequently force people to cross the pristine endogamous lines.

I have referred to the phenomenon of the coming together of cognate jatis by the term "horizontal stretch": "horizontal stretch" has resulted in the emergence of huge, monster castes such as Jats, Ahirs, Rajputs, Okkaligas, Lingayats, etc, and they play a vital role in state politics, and through politics in the allocation of resources, and in the distribution of benefits to followers. In each state there are several castes which constantly jockey for power, and the caste idiom is ubiquitous in mobilising people. This occurs in spite of the fact that castes are economically and socially haterogeneous, and that frequently the most bitter rivalries exist within a caste. A "consciousness of kind" is shared by members of a caste and it is pointless to dismiss this as "false consciousness".

I am aware that "horizontal stretch" is more characteristic of the higher castes than of the so-called lower, but even the latter come together occasionally to articulate their interests. Politicians have a vested interest in bringing them together for they are very necessary for promoting their careers.

But the endogamous groups which come together are really not equal, for even when public opinion recognises that some jatis are part of a much bigger jati, each constituent unit claims to be superior to the others. It is inherent in the nature of the caste system that there are no equals. "Horizontal stretch" therefore implies to some extent a vertical stretch.

The groups which have emerged today as castes, and are competing with each other for obtaining access to power, etc, are different from the local sections of the different castes in the traditional system, but even today in the village diverse castes continue to come together for agricultural production. But even here changes are occurring in the sense that cash payments are replacing old patron-client relationships, and rural-urban links are becoming closer. The members of the Scheduled Castes may refuse to perform certain services and the heriditary headman and accountant have disappeared in many parts of the country. Commercial agriculture had sharpened economic disparities between the rich and poor in many areas, and cheaper labour is frequently invited from outside to beat down local labour

To sum up: The caste groups which are emerging in urban areas and which are in competition with each other for obtaining access to power and resources

bear very little resemblance to traditional caste in rural India. But as against this it should be noted that even today agricultural production requires the co-operation of several castes, and even traditionally competition between different castes did occur though it was not very common. The use of the caste idiom is widespread, though the idea of hierarchy is being increasingly rejected by those groups traditionally confined to the bottom. (The State also has opted for egalitarianism as an end to be pursued.) It is no use saying, as Leach says, that present-day castes have ceased to be such. The situation is much more complicated than that. There are continuities and discontinuities, and social anthropologists have to reconcile themselves to work in *fuzzy* areas where not only boundaries are not clear but where multiple and contrary forces are at work. What Leach stated in a quite different context is peculiarly appropriate here:

> I do not want to suggest that we have *all* become out-and-out rationalists in the Levi-Straussian manner. On the contrary and particularly in Cambridge,... the tradition of British empiricism has been most staunchly upheld, but there is now a much greater willingness to recognise that the way we cut up the empirical cake for the purposes of analysis is a matter of convenience rather than something that is given by nature, and that however we choose to make discriminations between one social system and another there will always be a fuzziness at the edges, and that it is in this fuzzy boundary area, where our typological assumptions do *not* fit, that the problems of real theoretical interest are likely to be found.[6]

I would only add that in the case of caste "fuzziness" is not confined to the boundary but permeates the entire system. Those who want to deal only with tidy areas and who seek clear-cut answers ought to go elsewhere.

Notes

1 Leach has wrongly attributed the idea of "dominant caste" to David Pocock. For a definition of "dominant caste" see my essay "The Social System of a Mysore Village" in "Village India" edited by McKim Marriott (Chicago, 1955): "A caste may be said to be dominant when it preponderates numerically over the other castes and when it also wields preponderant economic and political power. A large and powerful caste group can more easily be dominant if its position in the local hierarchy is not too low."

[illegible] Inequality in India: The Historical Context

Satish Saberwal

This essay attributes the sociologists' lack of sensitivity — or at least their lack of intellectual response — to the magnitudes of poverty and to the pressures making for increasing inequalities in India to three convergent influences:

(1) the prevalent public ideology drawn partly from the colonial public institutions and partly from the Indian national movement; it is argued that both these strands served to desensitise *the generation entering the academia in the 1940s and the 1950s to issues of exploitation and of conflicts of interest between different segments of society;*

(2) the key premises of American cultural anthropology — which came to overwhelm Indian sociology in the 1950s — and the absence of countervailing insights in the other traditions considered by the Indian sociologists; and finally

(3) the social backgrounds of Indian sociologists which have been limited to relatively narrow strata, and their social experiences which have been confined to relatively narrow grooves; their resources of personal knowledge have, therefore, been much too lean to generate much resistance to the desensitisation caused by the first two factors.

> Given the omnipresent nature of contextual relations, it is obvious that all theories of relationship require a certain artificial closure .... But the closure evident in the theories I am criticising is not such a necessary METHODOLOGICAL closure. It is a closure stemming from cultural values, ideological values, or ignorance — and ignorance of the context happens to be one of our most highy developed cultural values.
>
> Anthony Wilden [1972:114]

WHEN in the early 1960s the Russian plant breeders were finally permitted to lay the ghost of Lysenkoism, the new political line allowed them to turn to genetics if that would serve them better, but *not* to rake up the history of Lysenkoism since the 1920s: to indulge in such embarrassing controversy would make for "disorganising the cadres" [Joravsky 1970: Ch 6]. Though not bound by such a command politically, Indian sociologists appear to have resorted to comparable quietude: for although the paradigm which arose in the 1950s has long since fallen of exhaustion, we have never seriously asked how it came to acquire its once enormous influence and what aspects of the Indian social reality it did obscure. This essay seeks to open up these questions.

Put otherwise, I'm interested in *secular* inequalities in India. Their importance in contemporary India struck me first with the appearance of Dandekar and Rath's "Poverty in India" in this journal eight years ago (1971). Apart from their demonstration that over 40 per cent of the population lived below the poverty line, their tables of distribution of income (e g, Table 2.7, p 38) showed too that the office clerk's income put him somewhere around the 95th percentile mark; and from that plateau one could see those enormous peaks of affluence not too far away. What puzzled me greatly was why the sociological significance of this sort of income distribution went completely unnoticed in the then sociological literature.

The question was posed even more sharply the next year during a seminar on "A Cultural Policy for India". The tenor of the proceedings may be captured with a quote from Suresh Shukla, Professor of Education at Jamia Millia Islamia:

> All past experience shows that at the point of planning policy, the greatest stress is laid on universal mass education: education of women, of scheduled castes and tribes, and in rural areas. At the point of fixing quantitative targets, proportionate expansion of all sectors takes over. At the point of performance, the highest achievements are all in the field of urban education, in secondary and college education, men's education, upper caste education and so on.[1] The sectors of priority in policy, including adult literacy, are the laggards in performance: this is in line with, a consequence of, and a reinforcer of the pattern of distribution of political and economic power [Shukla 1975: 246].

Clearly there was something in the structure of the wider Indian society which regularly pulled these "plans" out of shape. What was it? Why did it simply fail to register on the sociologists' analytic consciousness?

Explanations for so massive and so obvious an error of omission must necessarily be complex. The sociologists' lack of sensitivity — or at least their lack of intellectual response — to these magnitudes of poverty and to the pressures making for increasing inequalities in India, this essay will argue, can be attributed to three *convergent*, individually potent, and mutually autonomous influences:

(1) the prevalent public ideology, whose premises were drawn (a) partly from the colonial public institutions which, in turn, incorporated the premises of British social and political thought, and (b) partly from the ideology of the Indian national movement; I shall argue that both these strands served to *desensitise* the generation entering the academia in the 1940s and the 1950s to issues of exploitation and of conflicts of interest between different segments of society; and that this desensitisation was aided by:

(2) the theoretical, methodological, and substantive interests of American cultural anthropology — which came to overwhelm Indian sociology in the 1950s — and the absence of countervailing insights in the other intellectual traditions to which Indian sociologists took recourse; and finally,

(3) the social backgrounds of Indian sociologists have been limited to relatively narrow strata, and their social experiences to relatively narrow grooves; and therefore their resources of personal knowledge have been much too lean to generate much resistance to the desensitisation caused by the first two factors.

Public Ideology

Can one identify the key ideas shaping the contours of public opinion at the time of independence and since? Perhaps the most searching analysis comes from a political sociologist, Rajni Kothari (e g, in 1976), looking for the structural flaws contributing to the crisis of early 1975. Interesting as far as it goes, it is not of much help in our particular concern here. We are interested in such elements in the public ideology as served to desensitise sociologists to the magnitudes of, and the trends in, secular inequalities. Some pointers to these elements should be available in the sociologists' own abundant writings; it would then be necessary to trace these pointers to their historical roots. Here as in any enquiry, all possible errors of judgment cannot be forestalled; the need is to define the problem and to get a debate going.

One set of possible influences concerns the variety of ideas which might be placed under the rubric "traditional". These would include the ideology of hierarchy, embodied in the caste system, and examined at length by Louis Dumont, as well as the Mughal style of imperial governance. I shall not consider these though it might be argued that their influence, operating through the culture of university departments and of the wider, quasi-political academic arenas, contributed to the otherwise inexplicably long innings of the paradigm of the 1950s. I shall bracket these off[2] because such mechanisms could only have served to *prolong* the sway of the paradigm espoused by the influentials of the 1950s; the real questions are about the particular content of this paradigm and the context which brought its protagonists their influence.

Colonial Heritage

In propagating the paradigm of the 1950s, M N Srinivas had a pivotal role; and our search for the beliefs which blocked the perception of secular inequalities can well begin with his "Social Change in Modern India" (1966), a sociological landmark at the time of its publication. It presents his most comprehensive interpretation of the wider social processes active in India. The terms "equality" and "inequality" are missing from the index though some related aspects are subsumed under the category "caste"; but the second chapter, on "Westernisation", shows exactly where Srinivas *went off the rails:*

> Implicit in Westernisation are certain value preferences. A most important value, which in turn subsumes several other values, is what may be broadly characterised as humanitarianism, by which is meant an active concern for the welfare of all human beings irrespective of caste, economic position, religion, age, and sex. *Equalitarianism and secularisation are both included in humanitarianism* ... (p 48, emphasis added).
>
> Humanitarianism underlay many of the reforms introduced by the British in the first half of the nineteenth century. The introduction of British civil, penal, and procedural law put an end to certain inequalities that were part of Hindu and Islamic jurisprudence ... (p 48).
>
> According to O'Malley,[3] two revolutionary results of introducing the British judicial system were the establishment of the principle of equality and the creation of a consciousness of positive rights ...(49).
>
> The principle of equality found expression in the abolition of slavery, in the opening of the new schools and colleges — in theory at least - to all irrespective of religion, race and caste ... (49).
>
> As British rule progressed, rationality and humanitarianism became broader, deeper, and more powerful, and the years since the achievement of Independence have seen a remarkable increase — a genuine leap forward — in the extension of both. The attack on Untouchability which Independent India has launched povides a striking example of such extension ...(49).

Perhaps it would not be fair to judge Srinivas's understanding of colonialism in 1966 by today's standards.[4] Unmistakable, however, is the profound impression made upon him by British humanitarianism, seen to subsume equalitarianism. Our confidence that we have here an appropriate point of departure is enhanced by the assenting echoes of this interpretation for years in the work on eminent sociologists [e g, in Yogendra Singh, 1973].

We must recognise immediately that the belief that British rule had a strongly equalising influence upon the highly stratified Indian society has been potent and widespread, defying the fact that the colonial order was built around the central principles of *institutionalised racial inequality* and of strong support for indigenous structures of power and authority — especially after 1857 [e g, Metcalf 1965: Ch 3ff]. This potency could not have come merely from colonial spokesmen like L S S O'Malley. It is clear that some notion of "equality" was implicit in various colonial institutional structures — the courts, the schools, the franchise — and therefore it is necessary to look for the sense in which the British used the term.

Reflecting upon the nature of "equality" before the law, equality of vote, and so forth, it becomes clear that the reference is to a certain lack of invidious discrimination in specific situations and relationships. This limited equality is fully compatible with the enormous inequalities of wealth and status all too familiar in British society. In British social and political thought this usage goes back at least to Hobbes in mid-seventeenth century. Models of the capitalist society developed in this tradition posited that everyone is subject to the rules of the market in *equal* measure and that the law is blind to the differences of status between individuals [Macpherson 1962: 74-86; 199ff]. (The principles perceived by Hobbes and his successors as applying to the economic market of capitalism would ultimately be extended to the political market too in the form of one man, one vote.)

This notion of equality fitted closely the interests of a rising bourgeoisie anxious to ensure that, when the public law intervened in its affairs, no special allowance would be made for the entrenched landed interests with their heritable privileges. In the course of the triumph of the bourgeoisie, this somewhat esoteric sense of "equality" was built into the British legal and political institutions; and unless we remember this admittedly nebulous sense of the term, we are likely seriously to misunderstand the implications of these institutions for the structure of Indian society.

To restate the issue more generally, the colonial regime, westernisation, etc, came to be mistakenly associated in the sociological mind with a tendency towards "equality". Employing the term unreflectively, we did not notice that the term was in fact a cover for *very* unequal control over property — and therefore also for the associated inequalities of status, powers, and so forth. These inequalities, common to capitalist societies which have not institutionalised strong and effective redistributive mechanisms, were in colonial India further

reinforced by the strategies of colonial governance [see Saberwal 1979].

National Movement

One might have thought that the national movement would have scrutinised this and other aspects of the colonial institutions closely but, surprisingly at first sight, *the key ideas underlying the Indian national movement also served to direct attention away from these secular inequalities.* This movement was large and complex and is subject to much debate among specialists. After 1885 the Indian National Congress came to dominate it. Over the six decades to Independence, the Congress underwent several changes in leadership, if not as much in political ideology [Bipan Chandra 1979]. By 1920 Gandhi had risen to power on the national political stage and, over long spells, his was the dominant voice in the party and the movement; we may take his ideas as shaping the public ideology of the national movement importantly.

Gandhian thought in turn is a complex field of scholarship but there appears to be general agreement that, in marshalling his forces against the colonial regime, Gandhi laid great stress on a harmonious commonality of interests among Indians of different strata [B Bhattacharyya 1969: Ch 8; Namboodiripad 1959]. It is true that Gandhi brought to the movement something of a mass dimension, drawing in sections of the working class, peasantry, women and so forth [Brown 1972; Pearson 1979]; yet as a good general he was careful in almost every case to direct their energies against colonial rule, defining the interests of the different classes of Indians as mutually non-antagonistic. In a society as grossly inegalitarian as India's, however, such a definition must inevitably subserve the interests of the already dominant classes. This implication Gandhi did not confront, at least not until after Independence.

The foregoing is not to deny that Gandhi often said, wrote, and did things which showed his strong, genuine, and sincere personal concern for the poor. Indeed he suggested that *satyagraha* could be applied not only against the colonialists but also against the internal vested economic and other interests [B Bhattacharyya 1969: 230-31]. This is perfectly true, and his image of the ideal social order was a highly egalitarian one; but the unfortunate fact remains that about property relations within India, whatever his words, his actions were entirely quietist. After a spell of early hostility [S Bhattacharya 1976], the more perceptive of the Indian capitalist class recognised this, seeing in him (along with others in the Congress Right) both a worthy general in the battle against the colonial regime and their best bet for a post-colonial order that would protect their interests [Bipan Chandra 1975]. Many of them gave him their unstinted support, occasionally partaking also of some of his halo [Birla 1968].

Several influential strands of the public ideology, then, served to befog the Indian social reality at mid-century. Even though the colonial courts came to be established in India largely to clear the way for British commerce, 'egalitarianism' was part of the rhetoric surrounding the colonial legal order, and the rhetoric extended to other colonial institutions too. The inequalities institutionalised in the caste system had put Indians enough on the defensive to persuade some of them that colonialism had indeed brought India a more egalitarian order. The infrastructure of administration, law, communications, education, etc, designed to integrate India more closely with the colonial economy also allowed the Indian merchant castes some room to move into industrial entrepreneurship, and their pace quickened somewhat after World War I [Bagchi 1972]. Simultaneously, the course taken by the national movement was very much in line with the interests of the Indian capitalist class which, over the decades, came to acquire an enduring influence over the political process. [Birla, 1968, makes the connexion transparent.] This influence would combine with wider strategic considerations to ensure that the national movement defined the interests of the various classes in terms of harmony rather than conflict. It is true that Marxist writers — R P Dutt [1947] and A R Desai [1948] among them — recognised the conflicts of interest and the direction of inequalities in Indian society in all their starkness but as we shall see, Marxist scholarship was more or less beyond the pale at least into the 1960s; its insights were at best peripheral to the public ideology at mid-century.

Cultural Anthropology

The powerful, implicit, premises of the public ideology were entirely compatible with the key premises of American cultural anthropology; and this compatibility undoubtedly helps explain something of the speed and the extent of its influence almost immediately upon contact with Indian academia. While the fields of sociology and anthropology had both come to India at about the time of the First War, the fields did not spread much beyond Bombay, Calcutta and Lucknow [Rao 1974: xxvf, xxxf]. Resources for empirical research were scant, and relations between the impoverished university departments were sometimes sour [see Ghurye 1973: 59, 131]. When early in the 1950s, American anthropologists began to work in India,[5] with distinctive traditions in theory, method, and substantive concerns, the impression rapidly grew that they would sweep all before them.[6]

Although many leading Indian sociologists and anthropologists of the 1950s and later did their formative work in Indian, British, and Australian universities, the overall influence from the United States was much the strongest. It was felt through the very much larger number of research workers, whose work commanded general professional respect, through the vast stream of their publications, and through the large number of Indians going to the United States as students, researchers, teachers, conferees, and so forth. The intellectual premises of the British and Australian traditions, in any case, were for our purposes virtually indistinguishable from those of American cultural anthropology, and therefore I need consider here only the latter. I realise how presumptuous it is to try to force these premises into a few brief comments, but my task is made easier by my limited interest: to see how these helped further to befog the issue of secular inequalities in Indian society.

We may begin by noting that the American tradition was oriented rather loosely and inclusively towards the study of culture in contrast to the sharper concerns of British social anthropology with the social structure and, even more strongly, of the Marxian tradition with the linkages of *economic* structures with the other social dimensions. The humanistic affiliations of the American tradition were reflected in its interest in the *diversity of cultures* — in the full range of human experience — though,

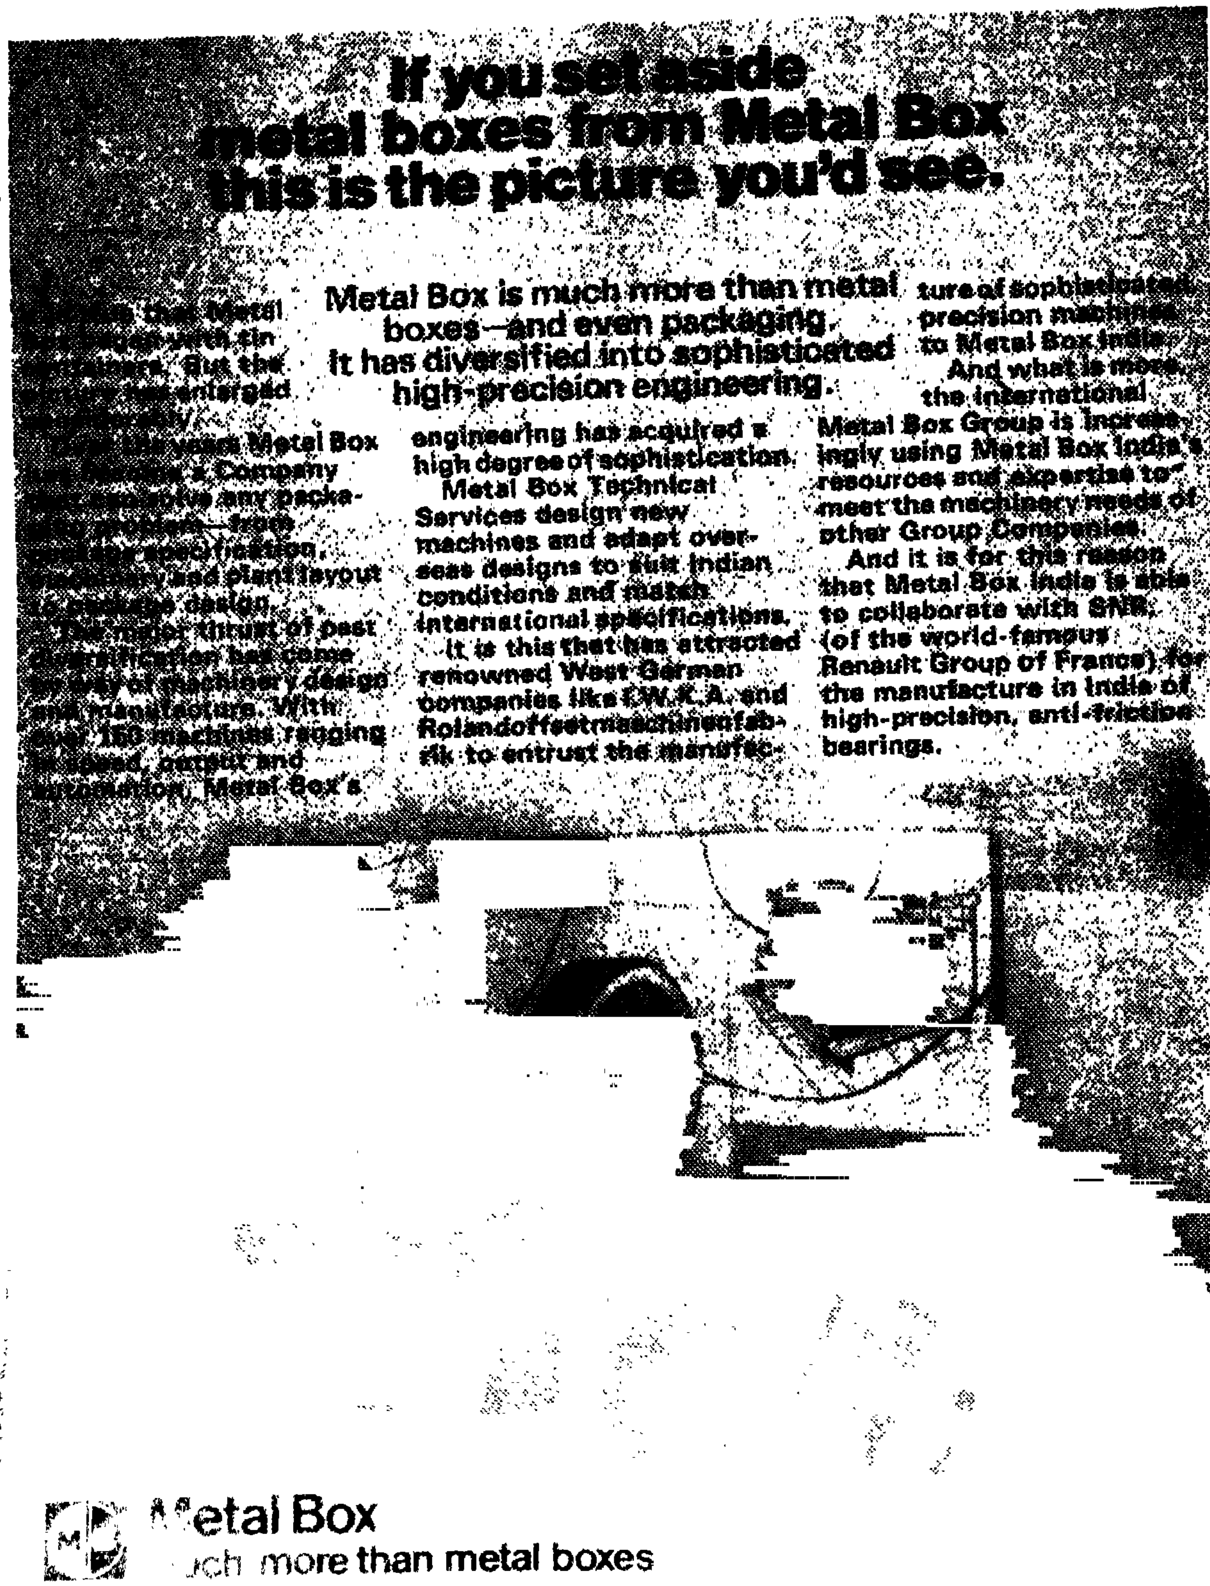
for practical reasons, it concentrated on, and was successful with, some parts of this experience more than with others. A liberal, rather than an ethnocentric, outlook was expressed in the doctrine of *cultural relativism*, holding that any society and culture has to be understood in terms of its own premises rather than in terms of external values, say those of Christianity, in the manner say the missionaries might be inclined to do [e g, Benedict 1934].

There was the assumption, too, that cultures usually are *integrated wholes;* and while conflicts are part of the human situation, cultures provide for their orderly resolution: cultures are to be understood with reference not so much to the conflicts of interest as to the procedures and the norms governing their management. The road to understanding these cultural wholes, furthermore, lies through the face-to-face community — that is a residential community. An anthropologist doing fieldwork for a year or two in an alien land could not easily cope with a community of more than about one thousand persons, and therefore for a decade or more nearly every anthropologist coming to India went to study a village community. The village was seen to provide a random sample of Indian society, much as a glass of water would provide a sample from the flow of a river.

The anthropological study of the village received reinforcement from the official Indian interest in "rural uplift" Its antecedents went several decades back [Haldipur 1974:31], and in the early 1950s it came to be institutionalised as "community development" with strong encouragement from the Ford Foundation [Taylor, *et al* 1965] The central thrust here too was to discourage the reorganisation of property relations,[7] say through land reforms beyond an attack on the larger zamindars, and to stress instead the harmonious commonality of interests, called "felt needs", convergent here were the key premises both of the public ideology and of cultural anthropology. For some Indian anthropologists and sociologists it provided too a welcome channel to the government and to "planning", and an opportunity to acquire a personal sense of importance.

This over-commitment to the village community, for all its fecundity in print, was from the present standpoint a methodological misfortune. In mid-twentieth century a great deal of the village community was in fact organised into the caste system which, therefore, came to be regarded as the key institutional complex of Indian society. Several generations of European scholars had already identified the caste system as a polar type in the continuum of stratificatory systems; and now the sociological mind came to equate the caste system firmly with inequalities in Indian society overall. More on the consequences of this fixation with the caste system later.

To be fair to this tradition of scholarship, it did not limit itself to the village community entirely. A characteristic initial distinction between orthogenetic cities (the indigenous one) and heterogenetic cities (the intrusive, colonial ones) directed attention towards the links between the village community and the sanskritic tradition, the centres of pilgrimage, and the like [Redfield and Singer 1954; Marriott 1955]. Such sources as Western education, factories, electoral politics, etc, were recognised as acting upon the village community; but there was no analytic framework for the larger whole wherein the interlinkages of these miscellaneous sources might be located. When the scholars in this tradition thought about phenomena in that larger world, the digits of their analysis came either from their understanding of the caste system [e g, Srinivas 1962] or from a characteristic perspective on the process of economic development — the "entrepreneurs" its prime movers [e g, Singer 1972]. The thought that the larger structure of contemporary India might have rather different patterns of internal integration and external control, worthy of enquiry in their own right, seldom touched this corpus of scholarly writing.



Before taking leave of American cultural anthropology, I would like to comment on its attitude to history. British social anthropology, when led by Malinowski and Radcliffe-Brown, or even by Firth, Gluckman, and Leach, may fairly be called anti-historical, but this will not hold for the American tradition. Their historical interests have been strong and have constituted two major clusters. One concerned the culture history of particular peoples studied. This was in some ways forced upon them, for their natural point of departure rested with the study of American Indians who had been mauled severely during the preceding century or two. To reconstruct their aboriginal way of life, recourse was necessary both to intervening archives and to the peoples' collective memory. Carried to India, this sensitivity was reflected in a concern either with local history [Marriott 1953] or with the civilisation [Singer 1966] or its sacred texts [Orenstein 1970].

The other cluster was concerned with general culture history, with a Toynbean sweep [e g, Kroeber 1944; Steward 1955]. Here the focus was upon the course of whole civilisations, their cyclical changes, perhaps their growth and maybe decline. Missing by and large, however, was a concern with the historical experience of the middle range: the rise of capitalism, the colonial expansion and its consequences, and the meaning of industrialism — or of a lack thereof. On this count until well into the sixties, the work of Bernard Cohn [e g, 1969] and of Clifford Geertz on Indonesia [e g, 1965] stood out as isolated exceptions. In so far as this phase entered the anthropologists' work at all, the theme song came from Redfield [1941] who, analysing a range of communities in Yucatan in Mexico, had encapsulated the historically created differences between the structures of pre-industrial and industrial societies into the popular, but ahistorical "folk urban continuum". All this would not have mattered had the Indian sociologists brought to their pursuits a sharper critical awareness, for correctives of a sort were then available elsewhere. These were for long ignored; the following sections explore why.

Sociological Traditions

Granted that the traditions of social and cultural anthropology gave few clues to the wider structures of societies such as India at mid-century, Indian anthropologists have since the 1950s been moving steadily over into the category of sociologists, and one might have thought that, in this new affiliation, they would seek or devise alternative paradigms for their analytic tasks; but the search has not been productive, the devising has not been vigorous. The latter will occupy us later; the unhelpfulness of much of the sociological tradition calls for enquiry now.

Britain, it will be recalled, has been the model for much academic activity in India during and since the colonial

If you set aside

period, and sociology — as distinct from social anthropology — did not get its colours there until well after the Second War. It is true that G S Ghurye, who dominated sociology at Bombay for long decades, had a Cambridge degree, but his mentor had been the anthropologist, W H R Rivers. Ghurye's predecessor at Bombay, Patrick Geddes, coming from the outer fringes of British academia, had been appointed Professor of Sociology; and therefore later appointees to the department also came to be called sociologists [see Ghurye 1973: 44*f*]. Sociology on the Continent is regarded generally as having arisen as part of the attempt to comprehend the social disruption issuing from industrialisation during the 19th century. That the process had been disruptive for British society too cannot be denied, but it would seem that it evoked an intellectual response not in the crystallisation of a discipline called sociology but, among others, in the works of Dickens, Marx, and Engels.

What about Marxism? To be sure, the sensitivity of this tradition to production relations and to the historic transformation of societies made it inherently the most promising potential source for insights into the structure of Indian society, and some of this promise has been realised since the early 1970s. The early work of A R Desai and Ramkrishna Mukherjee had offered serious, if sometimes uneven, applications of this tradition to the Indian situation. For reasons considered throughout this essay, however, Indian academia during the 1940s and the 1950s — and especially the sociologists — had been predisposed against the Marxist tradition.

Indian Marxists, furthermore, had additional burdens to carry. The public ideology at the time identified Marxism overall with Stalinist totalitarianism, with the dogmatism of much of the literature coming from Russia, and with the support given by the Communist Party of India to the British after Hitler invaded Russia [Overstreet and Windmiller 1959: 553-34 discuss the context]. This initial predisposition against Marxism grew stronger during the Indian sociologists' long tutelage to American cultural anthropology. A certain defensiveness was consequently induced in many Marxist scholars. Consider the case of A R Desai. His major work, "Social Background of Indian Nationalism", was published first in 1948. It remains, to this day, the only work by an Indian sociologist to comprehend the key dimensions of the wider structure of Indian society. His chapters concerning village India were, however, brought into question by the flood of village studies since the 1950s. Recently I asked him why he had not responded to this literature in his much reprinted work. A R Desai said that he had not wanted to be identified with the common communist practice of changing one's analyses to fit the changing political winds. Confused here was the difference between a scholar's necessary autonomy *vis-a-vis* centres of power and his necessary openness to fresh bases of data. One unfortunate consequence of this confusion was that the anti-Marxist sociologists could readily dismiss his overall work as being merely dogmatic Marxism.[8,9]

Many Indian academics transferred their affections after 1947 from Britain to the United States, where sociology has long been burgeoning, and one can make up a considerable list of Indians trained in, or strongly influenced by, various American schools of sociology: Yogesh Atal, Alfred Barnabas, Anil Bhatt, Ratna Dutta, Pradipto Roy, Lalit Sen . Whatever the quality of individual studies, no major advance in our understanding of Indian society is associated with any of them. One gets the impression that the technology of sociology in the United States has grown to suit certain facets of a particular sort of society: one which was built on capitalist premises from the beginning and whose members, in the course of industrialisation, underwent comprehensive socialisation of a sort that would fit them adequately to the capitalist industrial way of life. It may be that the very technical sophistication of this sociology, fitted ever so closely to some facets of American society, renders it unproductive in societies functioning with several orders of economic organisation — and their social and political correlates.

Barriers of language have stood between sociology in India and that in Europe, and until the late 1960s, the principal European influence, felt *via* English translations, was that of Max Weber. His influence is explicit in Andre Beteille's work and shows through in a diluted form in much else. It is necessary to note, however, that, for all his historical depth, Weber's dominant interest in the origins of the rationality of the Western industrial sort — and in the lack of such maturation elsewhere — excluded a great many other questions from his purview. Nothing in the mass of his writings would suggest that he understood very much about the implications of colonialism for societies under its sway.[10] Furthermore, although Weber distinguished between wealth, status, and power as dimensions of stratification, he did not use these distinctions to analyse any modern society on a national scale. (On both these counts the legacy of Marx is much more fertile.)

Andre Beteille almost alone among the Indian sociologists has acknowledged Weber's influence explicitly, evident in his first book [1965] as well as in the most recent one [1977]. The first book, a village study, established the separation of the dimensions of wealth, status, and power in the stratification of the village, but the village had, meanwhile, been integrated much more closely into the wider regional and national social, economic, and political frameworks too: disregarding this, then, did the limiting of the analysis to the village put serious limits also on one's understanding of the social process there? While Beteille has continued to write a great deal on social inequality, he has concentrated on the structure of agrarian relations [1974] and on the universal range of expressions of inequality [1977]. The wider inequalities within India do flit through Beteille's writings but are seldom held in focus for very long.

A diluted form of Weber's influence pervades much of the recent literature on stratification in India [e g, Yogendra Singh 1974]. It will be remembered that Weber had identified commensality and connubium as the two major indicators of the relative equality of status within a social stratum.[11] His reference was to societies wherein not only did the governing strata recognise themselves to be so but, furthermore, had no occasion to apologise for, nor any need to camouflage, the fact of their being in control. They had not had any pressures to tolerate commensal and connubial relations with their social inferiors; and the middle strata would in turn often follow their example.

During the decades since Weber, however, social convulsions have visited not only Russia, China, and other socialist countries but Germany

self. Certain patterns of colonial and racial dominance have had to retreat elsewhere. The old assurance of the governing strata everywhere has been somewhat jolted. They have often had to account for, if not to apologise for, the privileges associated with their being in control. It has been necessary to camouflage the reality of privilege; the governing strata almost everywhere have found it useful to proclaim that there is little difference between them and the anonymous mass.[12] Interdining between high and low is today commonplace almost everywhere; and intermarriage is well tolerated — even on occasion publicly celebrated to suggest, at least symbolically, the openness of the social order!

The analyst's task is made even more difficult by certain widespread policy packages: 'progressive' income taxation, state subsidies for the unemployed, health services, and the like.[13] Policy packages whose form, if not their content, has been similar came into widespread use in India under Nehru and since. Alongside this came the uncritical use of concepts arising in the structures of Western industrial societies. Together these generated powerful optical illusions among social scientists working on India, and it would be useful to trace this process in one case in some detail.

The first step in generating this illusion was the implicit assumption that the caste system was the traditional matrix of stratification not only in village India but also elsewhere.[14] It is true that much of pre-colonial urban India would have been organised residentially into caste groups or their analogues, but the principles underlying the supra-village distribution of resources in, say, Mughal India had very little to do with the caste system [see Habib 1963]. Put differently, a limited dissociation between caste and occupation in the urban milieu did not in fact represent a decisive change in Indian social structure.

Having assumed however that the link between caste and occupation had been central to the society, the second act in the rise of the illusion was the perception that this link was in fact being violated. The evidence for this violation could come from several directions. At least some aspects of the caste system had drawn fire from the national movement, and this hostility was embodied in the Constitution (piloted by an ex-Untouchable) and in the subsequent legislation providing for reverse discrimination favouring the scheduled castes and the like. Through politics, educational institutions, and the job quotas, a few members of the scheduled castes moved into non-caste occupations, and this limited dissociation between caste and occupation was acting upon other castes in the urban bureaucratic and industrial sectors also. It was easy enough in this situation to document some erosion of the caste order in certain urban areas [e g, Saberwal 1976b].

It should be remembered that pressures to accept the lower castes commensally had been active since late 19th century at least [e g, Jones 1976], and here and there marriages too would cut across the caste boundaries. Over the decades, evidence came too of a variety of challenges being mounted against, and of some decline in, caste ideology in regions as far apart as Punjab, Tamil Nadu, Kerala, and Maharashtra.

Having concluded that the caste system was declining, we cast about for another label for the new order, and the illusion was complete when the label 'class' was put on the new situation [e g, D'Souza 1967; Bhatt 1975]. What the term 'class' meant was drawn from its use in relation to Western industrial societies with their greater mobility and, in Srinivas's term, equalitarianism, the implication that inequalities in India were declining was thus smuggled into the terminology. Questions concerning class *relations* and the associated control over resources were seldom posed. Typically the whole argument was fastened to a community study — or to questionnaire data from a sample survey; wanting entirely were the wider perspectives both of historical development and of the contemporary social framework.

Sociologists' Interests

We move now to the third of the elements which have tended to veil secular inequalities from the sociological consciousness: it concerns us sociologists ourselves. While we have been aware of the cultural variation as between regions, our intellectual energies appear to have been more or less fully absorbed in documenting the variations in the caste system or, say, in kinship [Karve 1953]. The wider structures of Indian society either did not seem to be problematical or, when attention was directed to them, as we have [illegible] the digits of discourse were extraneous, these did not emerge from logic of these wider structures themselves.

One can only speculate why these wider structures did not seem to be problematical. There is some evidence that the first wave of sociologists, like the intelligentsia generally, tended to come from propertied, upper caste background; and one may surmise too that, as with this stratum generally, their socialisation would *not* normally have pushed them towards exploring their social environment extensively. If this was indeed so, and given the desensitisation coming from the public ideology and from American cultural anthropology, the consensual picture of Indian society emerging from the village studies would not be quickly challenged on the basis of the Indian sociologists' personal experiences elsewhere in the social space.

On the other hand, the 1940s, 50s, and 60s were periods of considerable opportunity for them even with the consensual picture, with all its flaws. In universities and in the research institutes the field of sociology expanded spectacularly, offering its members a comfortable living, if not always affluence. Compared with previous generations, opportunity and mobility were very much a part of these first generation sociologists' own experience, consciousness, and perception. It seemed to be appropriate for them to focus on similar situations of mobility and change elsewhere. [For a late example of this temptation, see Saberwal 1976b.] It enabled one to document the decline of the caste system, something we Indians had long been defensive about; and in any case the accounts of mobility and change made for much more interesting reading than those of immobility and stagnation. In early 1976 a young Swedish anthropologist, Stefan Molund, who had been working in a stagnant, poor neighbourhood in Kanpur expressed his puzzlement to me. reading the literature [illegible] where he encountered evidence of mobility, of entrepreneurial success, of caste organisations bargaining effectively with political parties, and so forth. He had not found much evidence of any of this in his area of study; this worried him; how would

his thesis hold together? What he did not know was that a whole generation of Indian sociologists had unwittingly misread the course being taken by Indian society, regularly though unconsciously emphasising achievement, mobility, mobilisation, reverse discrimination, egalitarianism, and the like, and neglecting the masses of poverty and the *growing* inequalities as well as the processes which made this permanently so!

* * *

In this essay I have argued that both the public ideology in the late 1940s and American cultural anthropology combined to desensitise us to the magnitudes of inequality, and the associated magnitudes of deprivation, which strike visitors as such stark features of the Indian social landscape; and nothing in our social backgrounds or personal experiences would persuade us to challenge the emerging consensual picture. The literature was not entirely wanting in references to bonded labourers [Harper 1968] or to destitute tribal groups [Gardner 1966]; but lying beyond the dominant analytic frame, these tended to be dismissed as marginal.

From the earlier sociological concern with the sacred texts, the paradigm of the 50s did move attention to the *social context* for interpreting behaviour, but this context was largely bounded by the local community. This has turned out to be misleading, indeed falsifying, for the local has long since been integrated into the larger mechanisms of appropriation, deprivation, and exclusion, during the colonial period and since. In the immediate future the pointers to these larger mechanisms may have to be taken from historians and economists. To continue to ignore that context is epistemologically deeply flawed; and this essay has sought to demonstrate this by placing the paradigm of the 50s itself in that socio-historical context.

Notes

[This essay is part of a general interest in secular inequalities in India. It has developed in contexts, and with colleagues, too numerous to be listed except JNU's History Centre, where the argument has been simmering, and the universities in Stockholm and Madurai, where it benefited from seminar discussions.]

2 For an earlier consideration of these issues see Saberwal [1976a].

3 Cited here is L S S O'Malley [1941:59]. While the British administrators' reports are an invaluable source of data for much of the colonial period, their views on the colonial encounter have to be handled with considerable discretion. O'Malley's own stock among modern Indian historians is quite low.

4 My forthcoming "Inequality in Colonial India" [1979] offers what I hope will be a somewhat less vulnerable interpretation.

5 See Saberwal [1970] on political context for this sharp expansion in the overseas interests of American anthropology.

6 During the 1920s and later, the vigorous organs of a native German intellectual tradition had enabled the Frankfurt School to digest the Anglo-American empiricism into its own system [see Jay 1973]; but nowhere in sociology were the Indian traditions able to muster the sense of mastery and of critical awareness requisite to the task of appropriating this empiricism. We succumbed to it; we did not have and did not seek the critical apparatus needed to examine its credentials and claims autonomously.

7 Interview with Erich Jacobi, Stockholm, November 28, 1978. During the 1950s Jacobi watched the scene in India closely as a senior member of FAO.

8 Desai wrote his thesis under Ghurye. While the latter's autobiographical account [1973] is replete with details of the theses of his many minor students, the name of A R Desai is not so much as mentioned!

9 The case of Ramkrishna Mukherjee is more enigmatic, but this defensiveness may in his case have led to his heavy concentration, since the 1960s, largely on methodological issues. His recent, wide-ranging, and erudite survey of the field over the past quarter of a century [1977] is silent on this change of direction in his own work.

10 This lack of interest in colonialism by itself, in the judgment of Romila Thapar [in press], led Weber to misconstrue the complex antecedents of industrial capitalism; she has argued that, without the colonial loot, fluid capital would in England have been so much scarcer that the pace and the course of industrialisation would have been very different. The argument is interesting even though, I think, Romila Thapar has misread the evidence somewhat.

11 Gerth and Mills 1946: 188, 19[illegible] 400; the indicators are applied to the caste system on pp 405-9.

12 The issue here admittedly bristles with complexity. On one side is Ralf Dahrendorf who, for the industrial West, stresses the high rate of social mobility and the expansion of the "social rights of citizenship", so that only "the inequality of power and authority which inevitably accompanies social organisation" remains — or will remain — as the "fundamental inequality of social structure" [1959:64]. On the other side is Raymond Boudon [1974] who sees this much vaunted social mobility as being principally *lateral*, implying that the structure is very much less open than Dahrendorf suggests.

These arguments are peripheral for India. Inequality here is *scarcely a matter of interpreting* complex statistical data. The suppression of its awareness here is much more direct: one among many examples concerns the Director of a private sector social research centre, a very highly paid, affluent man (in fact *not* a social scientist at all!), who responded to a staff member's proposal to study urban poverty with the comment, "Poverty? What poverty? I'm also poor."

13 For one attempt to de-mystify their consequences for inequalities in England, see Titmuss [1962].

14 Fuller [1977] has argued that the caste system in a tightly organised village structure was not so much the traditional — precolonial — pattern as the outcome of the economic and political processes in the colonial order. (Ulf Hannerz gave me this essay.)

…eprivation

Three Case Studies in Punjab

Mark Juergensmeyer

To describe the lowest strata of Indian societysolely in caste terms or solely in class terms tends to place undue emphasis on one or the other, the social or the economic components.

An emphasis on caste as the defining characteristic implies a cultural continuity between the lower and higher strata of society; but this obfuscates the radical differences between them, differences which exist largely due to the labouring class character of the lower caste community.

On the other hand, to emphasise only their class characteristics would neglect the many members of lower castes who have begun to move out of their labouring class roles but for whom social discrimination is a real form of oppression. Then too, the many social movements which have erupted from the lower castes during this century have been based more on cultural solidarity than on labouring class unity, and yet have provided a basis for collective economic mobility for the lower castes. The movements have capitalised on both the social and the economic integrity of the lower caste community.

One might regard the lower caste communities, then, as 'cultures of deprivation', in which there are both social and economic elements. The word 'culture', as it is used by some anthropologists, implies a complete sub-society, with integrated social, religious, economic, and customary practices which are distinctly different from those of the larger society. The word 'deprivation' suggests an awareness of the limitations of these cultural elements vis-a-vis *the larger society, and a social identity built upon that awareness.*

Both of these matters need to be argued and described further; and that is the purpose of this article. The description is based on three case studies in Punjab.

THERE seems to be an unrelenting debate about whether the lowest strata of Indian society are best characterised in economic terms, as the poorest classes, or in social terms, as the lowest castes. When one looks at the actual situation, one realises how Gordian the knot of confusion is, for on the local level the social and economic aspects are hopelessly intertwined The categories of class and caste are interwoven and appear mutually to buttress each other For all practical purposes, at least in the area which I know best, Punjab, the poor are the Scheduled Castes and the Scheduled Castes are the poor.

Moreover, to describe the lowest strata of Indian society solely in caste terms or solely in class terms tends to place undue emphasis on one or the other, the social or the economic components. An emphasis on caste as the defining characteristic implies a cultural continuity between the lower and higher strata of society; but this obfuscates the radical differences between them, differences which exist largely due to the labouring class character of the lower caste community. On the other hand, to emphasise only their class characteristics would neglect the many members of lower castes who have begun to move out of their labouring class roles but for whom social discrimination is a real form of oppression. For them, the old cultural identities are still strong Then too, the many social movements which have erupted from the lower castes during this century have been based more on cultural solidarity than on labouring class unity, and yet have provided a basis for collective economic mobility for the lower castes. The movements have capitalised on both the social and the economic integrity of the lower caste community

One might regard the lower caste communities, then, as 'cultures of deprivation' in which there are both social and economic elements. The word 'culture', as it is used by some anthropologists, implies a complete sub-society, with integrated social, religious, economic, and customary practices which are distinctly different from those of the larger society The word 'deprivation' suggests an awareness of the limitations of these cultural elements *vis-a-vis* the larger society, and a social identity built upon the awareness. Both of these matters need to be argued and described further; and that is the point of this article. The description will be based on three case studies in the Punjab.

But first, it might be appropriate to point out that such 'cultures of deprivation' are found in many parts of the world. Although the concept of ritual pollution has complicated the Indian situation, the coincidence of social oppression and poverty is common to minority groups everywhere, and is not contingent upon the peculiarities of Indian culture. Oscar Lewis has argued that 'cultures of poverty' exist at the bottom of the socio-economic hierarchies of most societies.[1] Despite Louis Dumont's argument that it is improper to speak of castes within a society unless there is a caste *system* — a whole society arranged in hierarchical groups[2] — there are many societies which have birth-ascribed social groups, similar to India's Untouchables, which are considered to be socially inferior through some permanent stigma.[3] In addition to the Blacks in the United States, pariah groups include the Eta in Japan and certain blacksmith tribes in East Africa

Comparisons between India's Untouchables and the Blacks of the United States are especially apt, if not always accurate.[4] In both cases, social and economic conditions combine to create a culture of deprivation Like the Blacks, the Scheduled Castes have been in a situation of semi-slavery over many centuries. They have been relegated to the most menial economic roles, their time and labour have been at the mercy of the upper castes; they have been unjustly regarded as child-like, dumb, and unclean; and they have not been allowed to participate in the affairs of the larger community. And both lower castes and Blacks have utilised movements of social protest for

their social and political liberation. It should be pointed out, however, that there are also some differences between Blacks and lower castes. The Blacks are racially separate from the dominant society; and although it is sometimes argued that the Scheduled Castes are racially separate from upper castes, their physical appearances are much like the rest of society.[5] Then there is also the argument that the lower castes are integral to the economy and culture of the larger society in ways which marginal groups in other parts of the world are not. These are debated points, but they illustrate the fact that the social configuration of each society has its own character; and that the cultures of deprivation throughout the world, if similar in some respects, are not the same.

Cultures of Deprivation in Punjab

There is considerable diversity among the cultures of deprivation even within a single Indian state. The two major Scheduled Castes in Punjab — the leather-working *Chamar* and the sweepers, the *Chuhra* — differ from each other, and in different parts of the state; and there are also religious differences among them. They are a diverse and large lot, represented in even greater abundance in Punjab than in neighbouring Uttar Pradesh. They comprise almost 25 per cent of some districts. But there are some fundamental characteristics which unite them.

Although urban Punjab has a reputation for liberality in social attitudes, the stigma of Untouchability has remained, especially in the villages. In a village survey I conducted, I found that old practices, although frequently less common, die hard: eating, smoking and sitting with upper castes was denied; separate wells were maintained for the lower castes; forced labour was common; and the wives and daughters of the lower castes were subject to sexual abuse.[6] These experiences of social oppression were compounded by the experience of poverty; and I found that although the landless labour wages in Punjab are the highest in the nation, the Scheduled Castes in Punjab are quite poor relative to the higher castes. In the ranking of castes on an economic scale there is a leap downward between the poorest of the upper castes (the 'Backward Castes') and the least poor of the Scheduled Castes. In the villages I surveyed in Punjab, Scheduled Caste members were crowded over four to a room, whereas the upper caste rations was a more comfortable 1.5. In many Scheduled Caste families, every member, from young children to aged grandmothers, were engaged in some form of employment in addition to the tasks of maintaining their household, simply to ward off hunger and the burdens of severe debt.

The society of the Punjab lower castes is demarcated by the features of social prejudice and poverty. But the differences between upper and lower caste societies are characterised by other factors as well. In general, the social habits and mores of the Scheduled Castes are more flexible than those of upper castes. Scheduled Castes are more liberal over the taboos against meat, of all kinds — even beef. Divorce is permissible, although not especially honourable.[7] The Scheduled Castes have a reputation for using country liquor, marijuana, and narcotics — sources of solace for the poor and disenchanted the world over. The family patterns tend to be nuclear rather than the large joint families which usually characterise the village society; perhaps this is due to the possibility of divorce, but more likely it is due to the mobility of the Scheduled Caste families. Out of occupational necessity, some Scheduled Caste nuclear families must live apart from their joint families in order to live near their upper-caste employers; other families drift apart in search of work. The language dialects of the Scheduled Castes are in some areas different from those of the upper castes; and the Scheduled Castes have channels of communication quite their own.[8] Traditionally, caste panchayats have provided them with separate social political institutions: that role within this century has been played by lower caste religious and social movements in Punjab, such as the Ad Dharm movement in the 1920s and 1930s.[9]

In each village, aspects of cultural activity — religion, public events, political and economic organisation — are shared with the wider community; but the social habits amd mores mentioned above are elements of identity and cultural behaviour which they experience only by themselves. Perhaps the most revealing characteristic of the culture of lower caste Punjabis is their lack of belief in the concepts of ritual pollution and in the karmic cycle of birth and rebirth, which are usually regarded as basic elements of Hindu culture, and which, according to Louis Dumont, undergird the legitimacy of caste.[10] There is, however, no name for this anti-structure of beliefs and customs of the Punjab lower castes; the culture of a deprived society. For the most part, it is a culture without the outward symbols and structures of cultural unity. But it is also a culture that is only partially submerged beneath the larger social, economic, political and religious structures of village society, as the following three case studies will indicate.

Village Bimla: Burden of Deprivation

In parts of Punjab, there are semi-feudal conditions in which the villages are dominated by a small number of landlords who have enormous power over their territories of control. These are oppressed societies in which the lower castes, as landless labourers, bear much of the burden of oppression. Much of the village culture is bent to the control of the landlords; but there are also popular cultural forms, such as those of religion, which present at least the illusion of escape. Fortunately, not many of these landlord-dominated villages remain in Punjab. One that does is the village of Bimla[11] near the Rajasthan border, where a quarter of the population of 2,000 are Scheduled Caste.

In Bimla, there are two main Scheduled Caste groups who live near one another at the edge of the village, outside the main walls; the names of the groups are informative, for they tell us something about their identities. The lower status group is called *Mazbi*, the term often given by members of the Sikh religion to the *Chuhra*, the sweeper caste; the term comes from the sweepers' alleged devotion to the Sikh faith *(mazhab)*. The relatively higher status group of Scheduled Castes is called *Chamiyar*, a variant form of *Chamar*, which is the name of the largest group of Scheduled Castes in Punjab, the leather-workers. The Chamiyars in Bimla are also sometimes called 'Ramdasia' or 'Raidasia', after the name of their patron guru, the sixteenth century saint and poet, Ravi Das.

Regardless of what their traditional economic roles are supposed to be, I found that in fact the Mazbis' and Chamiyars' occupational roles are exactly the same — landless agricultural labour. The land around Bimla is in large irrigated plots, which require a larger labour force than the smaller family

farms of central Punjab. The day labourers work primarily during the harvest season, and move among the landlord families according to the availability of work; there are permanent labourers too, attached to the richest landlord families.

The permanent family-related labour role in Bimla is extraordinarily demanding. These labourers are the mainstay of the labour force in the fields and in the landlords' large houses; and they also are pressed into extra services when the landlords request them. The landlords are Sikhs, of Jat castes; unlike the middlepeasant status of most Jat Sikhs in Punjab, the landlords in Bimla are wealthy, and very powerful. When the landlords war against each other, as sometimes they do, the landlords' Scheduled Castes are formed into small militias to defend their landlords and to do mischief against the opposing side. Within the past five years, two Scheduled Caste men have been killed in these skirmishes. Strangely, the Scheduled Caste militiamen continue to live among themselves in harmony, even if they have to fight for opposing landlord factions.

Perhaps the most onerous obligations are the demands which some men in the landlord families make upon the Scheduled Caste women. The youngest brother in one landlord family claims, with some pride, that he has totally eradicated virginity among the daughters of his father's labour families. Ordinarily, the women are given Rs 10 to 20 for their favours, which is supposed to keep down dissension over the matter. Three years ago, an older landlord who had a fondness for the wives of his Mazbi labourers was gheraoed by the Mazbis for two days, to the amusement of the rest of the village; selected beatings kept the gherao from continuing or becoming more embarrassing for the landlord. Of the Scheduled Castes, 70 per cent who are day-wage labourers are also subject to abuses of these kinds, but less frequently so. And they appear to be more at liberty to leave the village if the situation becomes inordinately unpleasant.

The basic social composition of Bimla is rather simple: a small number of feuding landlord families, a large number of middle-caste artisans and small landowners, and a large labour supply provided by the Scheduled Castes. Few children — and none of the Scheduled Caste children — attend school. The politics of Bimla is essentially the sport of the landlord families. In recent elections, most of the village supported the Akali party; but there was a suspicious 25 per cent Congress vote — exactly matching the numbers of Scheduled Caste voters. After that election, the landlords for some weeks denied the Scheduled Castes daily access to their fields, an act which was tantamount to blocking access to the Scheduled Castes' bathrooms; the ensuing sanitation problem in the village finallly persuaded the landlords to relent. According to the Scheduled Caste leaders, they had indeed voted for the Congress, but only to avoid voting Akali. There had been some sentiment among the Scheduled Castes for voting CPI (Communist), but they decided to vote Congress as a bloc.

The one great diversion in Bimla — aside from the landlords' squabbles — is religion. There is a Sikh Gurudwara with a Granthi (priest) in the village, supported by the landlords; but the real religious interest lies elsewhere, in the cults of saints. Within Bimla is Ram-ji Das, a wandering Sant who has settled down on the outskirts of the village. The landlord families apparently took a liking to him: they have equipped the holy man with a cement-block temple *cum* residence, and five acres of land which includes a bathing tank, a garden, and a magnificent pipal tree. Ram-ji Das is a local fixture; perhaps every family in Bimla has come to him at one time or another for a blessing, a word of spiritual bliss, or a good omen. Ram-ji Das is of upper caste background (Jat), as are most of the other Sants and gurus which the Bimla villagers favour; yet a disproportionately large number or Ram-ji Das's followers are Scheduled Caste. As in the other religious groups, Scheduled Castes frequently provide half the following.

In addition, the Scheduled Castes have their own religious leader, who has the awe of much of the village. Bhagat Singh, a Chamiyar, is a priest in the Gogapir sect, which in this part of the Punjab is almost exclusively lower caste. Gogapir priests cure snake bites, after chanting and falling into a trance. Bhagat Singh, through his religious powers, has become the acknowledged leader of the Scheduled Caste community in Bimla — a role that he might have achieved through his commanding personal authority. The aura of the supernatural, moreover, enhances his leverage with the wider village society, where it is rumoured that he is in active communication with the serpentine world. His patients have come from all sectors of the village.

Despite Gogapir, and elements of other exclusively Scheduled Caste traditions in Bimla, one would find it difficult to identify specific symbols of a Scheduled Caste culture in the village. One might argue that many of the villagers participated in a culture of deprivation; for, with the exception of the landlords, they are all impoverished. Yet appearances are deceiving, for within their own section of the village, the lower castes are caught within an even more economically and socially limited society than that of the other villagers. Only the outward elements of cultural difference are absent; such demonstrations of cultural difference might, after all, be greeted by acts of great displeasure from the upper castes. The lower caste quest for cultural identity in village Bimla, however, may be seen in their involvement in religious and social groups which have given them — albeit in an illusory way — the experience of an alternative, a touch of an egalitarian society, and a bit of social leverage.

Village Nalla: Beginnings of Change

Most of the villages in Punjab are not as oppressive, or as socially divisive, as Bimla. Landholdings in the northern and central areas of Punjab tend to be more modest, with less extremes of wealth. And, even though the lower castes are still regarded as Untouchables in these areas, their economic conditions are more flexible, their social status less onerous. Paradoxically, the separate social identity of the Scheduled Castes appears to be stronger in these areas.

Village Nalla[12] is a case in point. Nalla is located on the other side of Punjab from Bimla; but the distance is more than geographical. Nalla is in an idyllic setting on a hill above the Sirsa river, with the foothills of the Himalayas mounted behind. Nalla has a population of some 350, 85 per cent of which are of Gujjar caste, an agricultural caste known for raising cattle; about 50 of the villagers are Scheduled Castes, some 12 per cent of the total population, all of them of Chamar caste. The Gujjars are not large landowners. The leading Gujjar family has about 40 acres, and three or four Gujjar families have even less than five acres;

some of them are almost as poor as the Chamars.

The Chamars live by themselves at the downhill side of the village. They have their own well. The Chamars have a few animals, and several families are shoemakers for the surrounding villages. The remainder are seasonal labourers, and do rather well during the harvest season, earning Rs 8 to 10 per day. Much of the year they have little to do, however, so the income yearly is not that remarkable. Two or three of the Chamar families do domestic work for the richer Gujjar families, they are paid at regular wage-rates, and there does not seem to be the grovelling subservience one finds in village Bimla. Nevertheless the Chamars are deferential to the upper castes, and aloof.

The aloofness is reciprocated by the upper caste families, although they are proud of their acts of charity and their attempts at the social uplift of the lower castes. In 1961, Nalla was designated a 'model village' by the government, which resulted in several new buildings including a sports stadium equipped with concrete bleachers and a roof; new housing also was provided for the Harijans, a row of concrete huts near the sports stadium. To the villagers' dismay, however, the Chamars have refused to move into Harijan housing; the Chamars felt as if they were being exiled from the village. The Chamars have been more appreciative of the government's gift of five acres of cultivable land to eight Chamar families in 1968. The land was redistributed from areas vacated by the three Muslim families who lived in Nalla before the partition of Punjab in 1948, and is now a source of support for the Chamar families. Only a few of the families actually farm their land, since they do not have bullocks and equipment, they rent the land to the upper castes at the rate of Rs 500 per year.

Despite the upper-caste attempts at generosity, the lower castes appear to deliberately maintain their independence in such matters as political loyalty. In recent elections, when the dominant Gujjar family supported the Akali party, almost all the village voted for the Akalis — all except the Chamars, who voted Congress. When the village returns indicated a sizeable Congress support, the dominant families determined that the Chamars were culpable; and retaliated accordingly through a series of beatings. One member of the dominant Gujjar family suggested that the beatings would be more effective by being administered before elections rather than after.

The independence of Chamar loyalties extends into matters of religious affiliation as well. The Chamars are regarded as Sikh[25] by the upper castes, since the Chamars wear the turban and keep the other customary observances of Sikhs. But the Chamars have double, even triple, religious affiliations. In addition to their Sikh identities, the Chamars claim to be Ad Dharm, recalling the name of a Punjab Scheduled Caste religious movement earlier in this century, and they use the term 'Ad Dharm' as their caste name. When asked their religion, they almost uniformly reply 'Ad Dharm Hindu'. The leader of the Chamar community in Nalla, Chanan Lal, an old shoemaker with a flowing white beard, remembers the day he went to a nearby village gathering of Scheduled Castes to hear Mangoo Ram, the leader of the Ad Dharm movement during the 1920s and 30s. Chanan Lal describes Mangoo Ram as 'that great man', whose message 'gave us hope, and made us into men'. Two miles from Nalla there is a temple honouring Ravi Das, the patron saint of the Ad Dharm movement, the Chamars occasionally visit it, and attend a Ravi Das mela there every year. The organisational network of Ad Dharm no longer exists, but the fairs and other events keep up the associations of Nalla Chamars among their fellow caste members in other villages. Apparently, there was once a regional council for the Chamar caste in the Nalla area; there is some talk of its revival.

In addition to their Sikh and Ad Dharm religious identities several Chamars are members of Radhasoami and Nirankari — the most popular of Punjab's new religious movements. Although these are inter-caste movements, only the lower caste families in Nalla have joined, no upper castes are represented in these, or in any other sect. The two Chamar families who belong to Radhasoami joined the faith about five years ago when a Radhasoami carpenter from an adjoining village came to the Chamar section of Nalla; the missionary zeal of his devotion to Radhasoami was enhanced by the fact that he visited the Untouchable Chamars inside their homes. The Nalla Radhasoamis have a picture of the Radhasoami guru on their walls, along with a portrait of the Ad Dharm's Ravi Das. One Chamar has compounded his loyalties by adding to those two pictures one of Karl Marx.

In Nalla, similar to the more oppressive village Bimla, religion provides elements of escape and an alternative social identity. Yet in Nalla, religion is also a part of the separate caste identity of the Chamars. In the relatively more open social conditions of Nalla, there has been more openness for variety and dissenting loyalties. Perhaps in Nalla it is not the culture of deprivation which is more widespread, but the expression of it. These cultural expressions have not changed the conditions of the Nalla Chamars markedly, but perhaps it has affected their self-perceptions, by providing the elements of a cultural tradition which the Nalla Chamars can claim as their own.

Boota Mandi: Culture of Achievement

In the more developed areas of Punjab — the industrial areas in and near the cities — the economic conditions of the Scheduled Castes are frequently better, although this is not uniformly so. The economically improved members of Scheduled Castes in some cases maintain an individualistic identity in the cities' developing middle class. More frequently, Scheduled Caste members maintain their old caste identities, and alliances. The paradox which was evident in village Nalla is even more evident in the Scheduled Caste areas of the city; a greater degree of economic improvement and social flexibility is characterised by a stronger turn towards distinctively Scheduled Caste cultural symbols.

This is certainly the case in Boota Mandi, a developed area at the edge of Jullundur City in central Punjab. Boota Mandi is entirely composed of a single Scheduled Caste — Chamars — but the term, Ad Dharm, is preferred instead. The name of their colony, Boota Mandi, means 'Boot Market', or more accurately, 'leather market', because that trade occupies the primary source of revenue and occupation for the community.

Until around 1930, there was nothing along Nakodar Road, where Boota Mandi now stands, except scrub brush and eroded fields. In that year, Seth Kishan Das and his four older brothers, who were tenant cultivators in nearby Nagal village, five miles away, came with the intention of setting up a

wholesale cloth business to cater to the British army cantonment in Jullundur. There had been caste tensions between the Chamars and landholders in their village, and the brothers came with hopes for a new beginning. Kishan Das and his brothers discovered that more money was to be made in the sale of leather for military boots, rather than in cloth; but the Muslims in Basti Gujan of Jullundur City had cornered leather market, and were not hospitable to competition. Since they were themselves Chamars, however, the brothers had better access to the sources of supply — the Chamars who collected the hides from the village hide-collectors and who did the rude tanning. Thus, Kishan Das and his brothers were able to give the Muslims competition despite the Muslims' attempts to drive the brothers out of the market through price flutuation and intimidating their sources of supply. It was not until after partition, and the exit of the Muslims, however that Boota Mandi prospered.

Soon another Chamar, Sundar Das, came to Boota Mandi from village Dhanal, four miles away Sundar Das had saved money selling leather to the Chinese shoemakers in Calcutta, so he also was able to enter the leather business. Various uncles and cousins of Sundar Das and Kishan Das migrated from the villages to join them, and thus, the two major families, and much of Boota Mandi's population of 2,000, are either relatives of Kishan Das in the Klare subcaste or relatives of Sundar Das in the Mahay subcaste. 50 per cent of Boota Mandi's residents are involved in small-scale rough tanning which they do on contract, 30 per cent are wage labour for the various tanning enterprises, and 20 per cent are involved in the more lucrative trading business. The average worker does fairly well — between Rs 200 and 300 per month — and the main merchant families do extraordinarily well, in some cases earning thousands of rupees per month. One of the Mahay families has a television, a cousin who works with the BBC in London, and a son who is a bank manager and is married to a Punjabi girl (within his caste) from Kenya. A group of young Boota Mandi college graduates have recently established their own school, which specialises in educating the young ladies of upper caste families. Clearly, Boota Mandi is not a slum, nor a ghetto; a large number of its former residents have moved into the comfortable middle class surroundings of the new residential colonies in Jullundur, and many draw government salaries.

Many of the Scheduled Caste movements of this century have found financial and leadership support from among Boota Mandi residents. Even before Boota Mandi was founded, the original pioneers, Seth Kishan Das and Sundar Das, were both active in the Ad Dharm movement. For their caste name, the Boota Mandi residents have appropriated the Ad Dharm Mandal's name; and the patron saint of the Ad Dharm movement, the bhakti poet Sant Ravi Das, is prominently displayed in the art and calendars on Boota Mandi walls. In fact, there is a Ravi Das Gurudwara[13] in Boota Mandi, a Ravi Das library, and a Ravi Das community centre, all of them donated by the leading Klare and Mahay families around 1950, when Boota Mandi began to prosper. There is even a Ravi Das Youth Club, a social fraternity for the high school- and college-age boys. A Ravi Das school operates out of the Gurudwara, established in 1955, there are 350 children attending, an impressive 90 per cent of the school-age population. Over 50 per cent of both boys and girls attend high school.

The general level of caste pride is such that Ad Dharmi youth do not feel any reservation about admitting their caste identities in the larger society, they have even established Ad Dharm Youth Clubs in the local Doaba College in Jullundur, with branches in five or six other colleges. The Doaba College club has 42 members, and meets regularly for social events and political discussion; their main rival is the Sikh Students Association. Boota Mandi youth have been instrumental in forming a new socialist organisation; and one of them boldly ran for a parliament seat against India's former Foreign Minister, Swaran Singh.

India's best-known Scheduled Caste leader, B R Ambedkar, is also represented in Boota Mandi. Nearby, on Nakodar Road, a new statue of Ambedkar has been erected at a major intersection; a field has been fenced off and a small building there is the precursor of an 'Ambedkar Bhawan' to be built in the future. Further down Nakodar Road, towards the centre of the city, there are the offices of Ambedkar's Republican Party of India, and the editorial office of the Ambedkar journal, *Bheem Patrika*; it is published by L R Balley, who also lives near Boota Mandi, and is a frequent figure in the community.

Some of the young people in Boota Mandi have flirted with a local chapter of the Dalit Panthers which has recently been established in nearby Phagwara. In general, the level of activity and militancy among Scheduled Caste youth — especially the educated and reasonably wealthy ones — has increased dramatically in the past several years. In August 1978, the young people of Boota Mandi established their own version of the Dalit Panthers, the *Dalit Sangarsh Samiti*, which has launched demonstrations and agitations in sympathy with the Marathwada University issue in Maharashtra, and against local atrocities in Punjab.

One might wonder what is so *dalit* (oppressed) about the conditions of the young members of Boota Mandi's *Dalit Sangarsh Samiti*. They are, for the most part, well-educated and even wealthy. Are their protestations simply romantic tirades against conditions they have never experienced? Perhaps; and yet there is something both poignant and real about their acts of social protest. For, even though they enjoy the economic advantages of modern society, they are, after all, still Untouchables in the eyes of many in society. Their sense of solidarity with the less advantaged members of the Scheduled Castes is honest; they are, in their demonstrations of support, proclaiming that they too know the experience of deprivation, in a social sense. Perhaps also they are acknowledging that their particular economic fortune is a fragile and capricious thing. For, without the opportunities of modern industrial Jullundur, and without the luck and ambition of their grandfathers, they might be much like the village Chamars of Bimla or Nalla. So what unites the Scheduled Castes in the three areas — Bimla, Nalla, and Boota Mandi — is not so much a similarity of economic condition as it is a similarity in cultural awareness, a knowledge of who they are, who they have been, and who they might become.

Cultural Symbols and Contexts of Deprivation

The paradox noted in our consideration of the village Nalla Chamars has been completed in our impressions of Boota Mandi : the more advanced the group is, economically and socially, the more pronounced are the evidences of separate cultural identities. And within this paradox is a puzzle : how can a cultural identity be sustained without

the bases of identity — in this case, social oppression and poverty — which provided the common elements of that identity in the first place?

The puzzle is at least partly resolved by the fact that social movements — such as Ad Dharm, Ambedkar's movements, the Dalit Sangarsh Samiti — are the bearers of the new symbols of cultural identity. The symbols are of a community in movement, and not one mired in the helplessness which the conditions of social oppression and poverty often imply. The Scheduled Castes in the Punjab are in change; and the contexts for their cultural symbols are their attempts at social mobility, as well as their situations of oppression. Thus the disparate conditions of the locales of village Bimla, village Nalla, and Bhoota Mandi, are each contexts for a culture of deprivation in the Punjab, even though some of the contexts are mobile and changing.

Something unites the almost feudal members of lower castes in village Bimla with the more modern ones in Boota Mandi. That unity is their sense of socio-economic deprivation as members of Scheduled Castes; and it is this unity which continues to be the basis of social movements of solidarity and protest. Paradoxically, too, such movements tend to heighten and bring to consciousness an identity which had been latent. Thus only at some times, and among some people, has there been a collective identity for the whole of the Scheduled Caste community, a cultural identity for a common culture of socio-economic deprivation, a culture *in stasis* and *in change*.

How does this cultural identity affect the current discussion over whether benefits to the deprived should be defined by social or by economic categories — the Scheduled Castes or the poor? *It may confound the issue.* For, if the benefits awarded Scheduled Castes encourage a number of upwardly mobile people to retain their identities as members of Scheduled Castes, then government policy maintains and promotes that identity. And yet, it seems clear in my case studies in Punjab that the basis for common [illegible]ady exists, with or without [illegible] benefits. Moreover, for government to alter the basis for benefits at this ti[illegible]ould have a fissiparous effect i[illegible]he other direction: it would make [illegible]nctions within the Scheduled C[illegible] community which would underc[illegible] sense of cultural solidarity which often exists between the more advantaged and the poorer elements. *Such ties have economic advantages for the whole community — as we have seen in the case study of Boota Mandi. Such ties have been* essential for the creation of social *movements*. The furtherance of *economic distinctions would encourage the* individualism and social isolation which already sometimes accompanies economic success. The cultures of deprivation are laden with both social and economic elements. And, whatever solutions are offered for their improvement, they will have to take both elements into account.

Notes

1 Oscar Lewis, "Five Families: Mexican Case Studies in the Culture of Poverty", Boston: Beacon Press, 1962. The term 'culture of poverty' is sometimes associated with a causative model in which cultural attitudes are allegedly responsible for the inability of the poor to rise from their condition of oppression. This model does not apply to the Punjab Untouchables, whose cultural attitudes are those of defiance as well as submission. For a critque of the 'culture of poverty' model, see Charles Valentine, "Culture and Poverty", Chicago: University of Chicago Press, 1968.

2 Louis Dumont, "Homo Hierarchicus: The Caste System and Its Implications", (translated by Mark Sainsbury), Chicago: The University of Chicago Press, 1970, and published in France by Editions Gallimard in 1966, chapter 10, "Comparison: Are There Castes among Non-Hindus and Outside India?" and the Appendix, "Caste, Racism and 'Stratification' — Reflections of a Social Anthropologist".

3 An argument for the inter-cultural occurrance of castes and outcastes is made by Gerald D Berreman in 'Structure and Function of Caste Systems', in George DeVos and Hiroshi Wagatsuma, *eds*, "Japan's Invisible Race: Caste in Culture and Personality", Berkeley: University of California Press, 1966.

4 A comparison of Blacks and Untouchables, utilising quantitative analysis, is found in Sidney Verba, Bashiruddin Ahmed, and Anil Bhatt, Race, Caste, and Politics: A comparative Study of India and the US", Beverly Hills, Sage Publishing, 1971.

5 Herbert H Risley and other British ethnographers in the nineteenth century attempted to discern the racial differences by such devices as comparing measurements of nose sizes: currently such studies are in disrepute. For a more recent *review of the discussion*, see P C Biswas, 'Present State of the Problem of Correlation Between Racial and Caste Differences in India', *Anthropologist*, Volume XII, Nos 1 and 2, March and August, 1965.

6 The survey contained 93 questions regarding economic conditions, cultural attitudes, and political and religious affiliations. It was administered to approximately 150 upper-caste and lower-caste respondents *in six locations* (three villages, a town, and two sectors of a city) in 1970-71, and rechecked in 1978. The questions and a statistical tabulation of the responses are in Mark Juergensmeyer, "Political Hope: Social Movements of North India's Untouchables, 1900-1970", Ph D dissertation, Department of Political Science, University of California, Berkeley, 1974 (University Microfilm No 74-23, 959), Appendix A and Appendix B.

7 Marriage and family customs are still similar to those described in George W Briggs, "The Chamars", Calcutta: Associated Press, and London: Oxford University Press, 1920, chapter IV.

8 Regarding Scheduled Caste dialects, and their distinct difference from that of the upper castes, see John J Gumperz, 'Dialect Differences and Social Stratification in a North Indian Village', *American Anthropologist*, volume LX, 1958, also 'Religion and Social Communication', in *Journal of Asian Studies*, Volume XXII, June 1964. For separate channels of communication among the Scheduled Castes, see Robert J Miller and Pramodh Kale, 'The Burden on the Head is Always There', in J Michael Mahar, *ed*, "The Untouchables in Contemporary India" Tucson, The University of Arizona Press, 1972.

9 See my article, 'Ad Dharm: Religion of Untouchables' in *The Times of India*, Sunday, October 12, 1975. The movement is also featured in a forthcoming book on lower caste social movements which I have recently completed.

10 This point I explore further in 'What If the Untouchables Don't Believe in Untouchability?' in the *Bulletin of Concerned Asian Scholars*, forthcoming.

11 The name has been changed.

12 The name has been changed.

13 The Sikh term for a place of worship, 'Gurdwara', has been appropriated by some followers of Ravi Das; they claim that Ravi Das was also a guru.

Class and Jati at Asthapuram and Kanthapuram

Some Comments Towards a Structure of Interests

S S Sivakumar

Chitra Sivakumar

At the present stage of the development of social sciences in India, two somewhat contradictory trends appear to have emerged; the Marxian approach which relies heavily on class analysis and the empiricist approach which considers jati to be at least as important as class in the study of Indian society.

The present study, pertaining to two villages in the Chengalpattu district of Tamil Nadu, hopes to bridge this gap and to formulate certain hypotheses showing the historical and contemporary inter-linkage between these categories.

THE terms class and jati have been emphasised by two different schools of thought in India. Notwithstanding some non-Marxian attempts towards its use,[1] the term 'class' relies on the following premises :

(1) Historical Materialism as a philosophy;
(2) dialectics as a tool of analysis; and,
(3) 'mode of production' as the central point of reference.

The empiricist's analysis of caste or jati rests on the following premises:

(1) each society is sociologically unique;
(2) in India caste plays a major (and according to some dominant[2]) role in social relations, and
(3) the role and functions of caste are not explainable in material and dialectical terms alone.

Without having to go into many details, we wish to merely state that we accept the following possibilities as the starting point of our analysis: Firstly, conventional Marxist analysis, in confining caste to a superstructural role, has been less than fully attentive to its significance.[3] Secondly, the empiricists have, in turn, not fully exploited the economic significance of jati.[4]

The present study proposes to go into the interconnections between class and jati at Asthapuram and Kanthapuram. It must be considered as a sequal to the earlier works of one of authors.[5]

We address ourselves to one major question: What are the respective roles of class and jati in defining a structure of interests among the residents of the two villages. In order to elucidate the class-jati linkage in the contemporary context of the villages, we find it necessary to begin our discussion with a description of the agrarian society of the eighteenth century Tondaimandalam (the historical region to which our villages belong). This will constitute the first section of the present work. The second section consists of a description of the class-jati linkage in two villages during 1916. This section, is followed by the one which takes up the two villages in 1976. The fourth and the last section will consist of some hypotheses and some general observations pertaining to the cognitive world of the people of Asthapuram-Kanthapuram.

I

Production Relations and Jati in Eighteenth Century Tondaimandalam

At the very outset it may be pointed out that detailed recorded information on the role of jati pertaining to this period is very limited. To some extent, therefore, we also had to rely on local customs, legends, and practices, in an attempt to read history backwards.

Details of production relations among the different categories of persons in the eighteenth century Tondaimandalam have been taken up elsewhere;[6] for the present, we give a brief summary:

(1) The technology of paddy cultivation was stagnant at very low, and highly labour intensive, levels.[7] Paddy was the mainstay of the rural economy at that time.[8]
(2) The village economy was dominated by a class of individuals known as *kaniyatchikarars* (lords of the domain) who were also referred to as mirasdars.[9]
(3) Under the *kaniyatchikarars* were *payikaries* who were (temporary or permanent) resident cultivators, and whose tenure was held at the pleasure of the former. Next in the hierarchy were the village functionaries and artisans. At the bottom were *adimais* and *padiyals*, who were the servants of the *kaniyatchikarars*. While the former were bought and sold, the latter were bonded.
(4) Cultivation was undertaken either by the *kaniyatchikarars* directly with the assistance of servants or through *payikaries*.
(5) Each *kaniyatchikarar* owned a share of the village, which included the entire village domain, including the village site, tank beds, river beds, grazing grounds, and cremation and burial grounds. Under one form of co-sharing known as *arudhikarai*, the shares were permanently divided, and under another form known as *pasungarai*, the lands were periodically redistributed according to shares. Of these two, the latter was more ancient and, in many parts, predominant.
(6) Under *pasungarai*, the entire village output was considered as a composite whole and was apportioned into : (a) *Melwaram*, the overlord's share. (b) *Manyam*, output from land (partially or totally) exempt from revenue assessment. In the main, such lands belonged to the *kaniyatchikarars*, but also belonged in small sizes to village artisans and functionaries. Invariably, the temples were also provided with a *manyam* from some of the best lands. (c) *Tunduwaram* or *swamibhogam*, the fee paid out of the *payikaries'* output to the *kaniyatchikarars*. (d) *Swatantram*, the customary fees paid to the artisans and the village functionaries. On combination with (c) above, this constituted an account known as *swatantradittam*. (e) *Kanisumai*,

kalavasam, etc, share of the output going to the servants. (f) *Kudiwaram*, the remainder of the output which went to the *kaniyatchikarars* and *payikaries* (if any). It was estimated, towards the end of the eighteenth century, that the first five shares varied from 42 per cent to 38 per cent of the output, of which *melwaram* was around 30 per cent. It is therefore evident that the shares of the village output going to the servants, artisans, and functionaries must have been very small indeed.

(7) Under the *arudhukarai* system, all the above shares were individually apportioned among the *kaniyatchikarars*.

(8) The overlord who appropriated the *melwaram*, appointed officials to fix the annual assessment on each village after a first-hand survey. Connivance between the officials and the *kaniyatchikarars* over the assessment, could therefore work to the advantage of both parties — to the detriment of the overlord's share. That this was common occurrence is well known.[10]

(9) The political-economic implication of this contradiction between the *kaniyatchikarars* and the overlord was that their relative strengths were inversely related. Any form of collective unity on the part of the former would thus not only enable them to appropriate a larger part of the output, but also vest more power in their hands. As we shall see, jati organisations had a crucial role to play in this. Before taking up this point, let us consider the jati ramifications in some detail. This will be done at two levels. One, the village and the other at the regional level.

In 1799, the Tondaimandalam region was divided into 17,821 7/8 shares, out of which 13,994 9/16 (which were accounted for) were owned by 8, 837 *kaniyatchikarars*.[11] Over 80 per cent of *kaniyatchikarars* were Mudaliyars & Brahmins, the former accounting over 55 per cent.[12] Thus it is evident that these two were the dominant jatis. Further, there was a great deal of differentiation among the *kaniyatchikarars* themselves. Landownership among them ranged from 2.60 acres to 2,660 acres. Given jati endogamy, it is also evident that certain lineage groups were dominant within the dominant jati of the *kaniyatchikarars*. We have no reason to believe that members of the dominant jati also did not belong to the *payikaries* category. Available evidence suggests that this was possible.[13] The same evidence also suggests that *kaniyatchikarars* of one village could be *payikaries* of yet another village. At the bottom of the hierarchy, the *adimais* and the *padiyals* are said to have belonged to the Parayar and Palli castes. While the former worked for the Mudaliyars, the latter worked for the Brahmins. It is, therefore, evident that while there was a jati-wise polarisation at the extreme ends of the *kaniyatchi* hierarchy, there was an admixture of jatis at the *payikari* level.

The *kaniyatchikarars'* control over the villages had three crucial elements involving intra-jati patronage. First of all, the large number of locally maintained irrigation schemes (including irrigation canals extending upto 5 kilometres in length) was communally maintained by the *kaniyatchikarars* under the aegis of the *grama sabha* or *oor-kootam* (the village council).[14] Caste allegiance, therefore, became necessary for priority in the supply of irrigation water.[15] Secondly, temple lands which were of the best quality and were also partially or totally exempt from revenue assessment, were also under the control of 'well-to-do' *kaniyatchikarars*. Caste and kinship links with them enabled others who were not so 'well-to-do' to participate in the spurious (but quite common) enjoyment of the temple lands.[16] Thirdly, in the case of permanent *payikaries* (known as *ulkudis*) there was always the possibility of being confirmed as the *kaniyatchikarars* as long as they were supported by well-to-do members of their jati.[17] Thus jati connections enabled upward mobility for some at least. Finally, the biggest benefit sought after by the *kaniyatchikarars* was increasing acquisition of *kaniyatchi manyam* (assessment-free land for themselves). The extent of the above *manyam* often depended upon the influence of the jati, or some members thereof, at higher levels. All these reasons suggest that jati links were economically important within the village. In addition, establishment of affinity-cum-consanguinity, through cross-cousin marriages among the *kaniyatchikarars* of a jati, ensured the preservation of property, economic opportunity and power within certain lineage groups of a dominant jati. Thus kinship was one of the central aspects of the class-jati nexus within and across villages. Further, the economic dependence of the servicing and servant castes on the *kaniyatchikarars* of the dominant jati bestowed on the other members of the jati in the village a derived sense of status of a patron. This further reinforced the cohesiveness of the dominant jati.

Aside from this, the dependence of the servicing and servant castes on the *kaniyatchikarars* of the dominant jati added to the strength of the latter *vis-a-vis* the overlord himself as we shall see shortly.[18]

Let us now consider the role of the dominant *kaniyatchikarars* at the regional level in order to understand the regional aspect of the class-jati nexus. The region encompassing several villages was called the *nadu*. Almost all jatis including the Parayars appeared to have had *nadu* level organisations.[19] The dominant jati leaders at this level were known as *nattars* or *nattavars*. They were men of great wealth and following and were therefore the leading *kaniyatchikarars* of the *nadu*. It appears that at least in some of the jatis the *nattars* were voted into office and could be recalled if they lost their influence.[20] The *nattars* served as regional level intra-caste arbitrators. They were also responsible for the maintenance of jati *chowltries* (hospices), maintenance of large temples which had lands extending over several villages. They were also arbitrators on behalf of their jati in intra-regional, and inter-jati disputes. In an economy characterised by rain-fed irrigation tanks which were shared by several villages and locally maintained spring canals (serving one village, but by passing several others), irrigation disputes were obviously plentiful.[21] The role of *nattars* in adjudicating over such disputes was an important one. In fact, in the 18th century, when the English Common Law had still not arrived, the *nadu* courts (presided over by *nattars*) were major judicial institutions.[22] Finally, the *nattars* were so influential that often the overlord referred to them the grant of *manyams* to individuals.[23] Obviously, being a *nattar* enabled a *kaniyatchikarar* to add considerably to his wealth and power.[24] In addition, during the 18th century, leading citizens (apparently *nattars*) also functioned as *dubashees* (literary translators) to the Muslim rulers and to the Europeans. These *dubashees* were

sometimes more powerful and wealthier than any European official or the Nawab of Arcot himself.[25]

Aside from their great wealth and influence within their jati, the *nattars* also derived power through the subordination of the servant castes to them. For instance, the customary "right" of desertion (under oppressive conditions) enjoyed by the Parayars and other residents of the village could be effectively used to paralyse and deplete the revenue collection by overlords.[26]

Thus even an autocratic overlord had to reckon with the pyramidally structured and immensely powerful dominant jati organisations. The existence of more than one dominant jati in a region meant struggle among powerful *nattars* representing different jatis, over issues ranging from control of temples to disputes over *kaniyatchi* rights in villages.[27] The overlord's art of statesmanship therefore lay either in retaining the support of the *nattars* of the most powerful jati or in keeping the *nattars* of different dominant jatis constantly at loggerheads with one another. Hence, the overlord was seldom in a position to override the *nattars*. The Nawabs of Arcot apparently could not repress the power of the *nattars*. Ideally, of course, the overlord's hands were strengthened to a maximum if the leading *nattars* belonged to his own jati or community. We have little doubt about the veracity of the legend pertaining to the colonisation of Tondaimandalam area during 10th and 11th centuries by the Vellalas of Cholamandalam under Atondai Chakravarti (Mudaliyars being one of the jatis within the Vellala conglomerate).[28] Likewise, the advent of Telugu speaking Reddys (who constituted a dominant jati in Andhra) along with the conquest of Tondaimandalam by the Vijayanagar kings, and the advent of Muslims along with the Muslim conquest of the region, testify the necessity of jati or community support to the overlord.

To sum up, eighteenth century agrarian society of Tondaimandalam appears to have been characterised by a two-way linkage between class and jati. As we have seen, from the village level upwards, avenues, of upward mobility were literally closed to those without a proper jati bona fide. At the same time, the dominance of the jati itself depended to a large extent on its economic position, and the degree of power and wealth wielded by the individual members of the jati. From the point of view of an individual, since he was born into a jati, his own mobility prospects were, to a considerable extent, pre-determined by the already prevailing status of his jati. Within a jati, the mobility prospects of an individual was further affected by his lineage and kinship links. Considering the long term stability of dominant jati equations (to be broken up only through conquest or colonisation), the social definition of the 18th century individual in Tondaimandalam appears to have consisted of his lineage, kinship, and jati origins.

II

Asthapuram-Kanthapuram in 1916

The 19th century was a period of virtual destruction of *kaniyatchi* as a system of production relations. After over fifty years of tenacious struggle, the *kaniyatchikarars* as a class were decimated by the ryotwari regulations.[29] First of all, the *kaniyatchikarars* were reduced to the status of mere ryots and all distinctions between them and the *payikaries* ceased to exist. Secondly, the *inam* regulations took away their *manyam* lands once and for all. The prosperous among the erstwhile *kaniyatchikarars* now survived as prosperous ryots. But the poorer ones became poor ryots or possibly even tenants. The *payikaries*, now without any barrier between them and ownership status, emerged as independent ryots (wherever resources permitted). Land became private property in the modern sense of the word.[30] Acquisition of land no longer entailed the jati sanction within the village, but merely, an application for an ownership *patta* at the collectorate. Finally, the drastic shifts from the previous revenue assessments "in kind" to cash assessments under the ryotwari system, the heavily increasing burden of the assessment, the growth of railways and other transportation networks, initiated the process of commercialisation of agriculture.[31] These changes, therefore, paved the way for a class structure based on modern forms of private property.

However, in many respects, jati organisations continued to be important. For instance, within the village, irrigation management and temple management continued to be within the control of the dominant jati, now under the leadership of the prosperous ryots. Also within the village, the prosperous ryots and their jati-men continued to enjoy patronage over the servant and servicing castes. In the case of the servant castes (particularly the Parayars), their "emancipation" during the 1840s, and the theoretical possibility of "equality before law", and the hypothetical chance to become ryots, did not in the least alleviate their impoverishment. The loss of *kalavasam* and other traditional rewards, combined with the threat of insecurity entailed by their "emancipation", tended to enhance their misery. Many of them in southern Chengalpattu, underwent voluntary bondage. As for the servicing castes, the lapse of legality of their customary rewards left them also at the mercy of the prosperous ryots of the dominant jati in the village.

The dominant jati groups at the regional level acquired a new significance. They were no longer interest groups struggling with the overlord for ascendancy, in a decentralised polity. The advent and proliferation of a centralised bureaucratic regime based on English Common Law and centralised juridical machinery, and the Western System of education (which was vital in determining access to government jobs), all tended to reformulate the strategy of jati groups. Since Western education and government jobs became the new avenues for power and prosperity, jati groups became groups of regional lobbyists for government patronage. The degree of patronage enjoyed by members of a jati from the government, thus became a powerful variable in determining jati dominance.

An interesting phenomenon in Tondaimandalam in the 19th century was the emergence of Pallis as a dominant jati. Thanks to the leadership provided by some jati members who had entered modern professions (e g, law), and some others who were well-to-do, the Pallis formed a jati conglomerate with Padayachis, Gounders (of North Arcot) and others, called the "Vanniyakula Kshatriyas". This conglomerate claiming a genealogical root in a Chola-Pallava intermarriage fifteen centuries previously, and worshipping Raja Desingh (a Maratta petty chieftain) as its martial hero, emerged against the background of a powerful non-Brahmin movement organised by the dominant peasant jatis.[32]

Thus the regional background to our entry into Asthapuram-Kanthapuram of 1916 consisted of a new class structure co-existing with jati organisations with new functions. However, we must note that a contradiction had emerged within jati as a structure of interests: while there was some degree of weakening of

Table 1: Distribution of Peasant Households, Land Ownership and Occupational Holdings among Different Classes—Asthapuram-Kanthapuram (1916-1976)

Class		1916			1946			1976		
		No of Households	Land Owned (Acres)	Occupational Holdings (Acres)	No of Households	Land Owned (Acres)	Occupational Holdings (Acres)	No of Households	Land Owned (Acres)	Occupational Holdings (Acres)

dominant jati hegemony at the local levels, there was a strengthening of their conglomerates at higher levels

Let us now consider the nature of class-jati nexus in the two villages in 1916.

Table 1 gives us an idea of the relative economic strength of different classes of peasants during 1916 Table 2 provides similar information in terms of per household averages. Table 3 gives us an idea of the relative economic strength of the different jatis and Table 4 sums up the class-jati-wise distribution of economic strength for the same year.

The definition and identification of different classes of peasants in the two villages are discussed elsewhere.[13] Here we merely present a brief summary. (1) Big peasants are those who use hired labour to obtain a major part of their output. Usually, they owned over ten acres of land and sometimes over hundred acres. The distinguishing feature of this class is the abundance of resources for purposes of consumption as well as production. (2) Medium peasants also obtain a major portion of their output through the use of hired labour They usually own around five to ten acres of land, but they also augment their own holding with leased-in land. Their resources are far more limited as compared with those of the big peasants. (3) Petty peasants own very small land-holdings (usually under two acres) and by and large also indulge in share-cropping to a considerable extent in order to make both ends meet. Due to their penury, they often cut down on labour hire and if family labour is not adequate to fill the gap, they suffer low yield levels (4) Landless peasants, of course, are landless. Mostly they depend on their wage earnings and sometimes they undertake to share-crop small plots of land. (5) Landlords are those who lease out their lands. The reasons for their non-cultivation may vary from non-availability of able-bodied males in the household to preoccupation with certain other sources of earning (e g, business)

It is evident from Tables 1 and 2 that the big peasants owned most of the land in 1916, and the landless peasants were the most numerous. The dominant production relation was therefore the one between these two. As we shall see shortly, the class of petty peasants also constituted a part of this relationship. Briefly stated, the relationship between the big peasants and landless peasants was as follows:[34] Of the 71 landless peasant households, 52 were known as *padiyals* and they were full-time servants of the big peasants. All the 52 were bonded to the latter. The remaining 19 were known as coolies and were daily wage-earners. The relationship between the *padiyal* and the big peasant was characteristic of the production relations in the region at that time.[35]

The most dominant big peasant of the two villages at that time was a Mudaliyar whom we shall call TM. 39 of the 52 *padiyal* households worked for him Invariably, a *padiyal* joined TM's household as a collateral against loans advanced to his father. Usually, he joined around the age of 10 or 12, performing simple chores. By the age of 15, he graduated to the first of agricultural chores such as irrigating the fields. He became a full-fledged worker handling all agricultural jobs around 18. During this process, the wages (padi) of the *padiyal* increased from a minimum of 9.4 kgs to a maximum of 76.8 kgs of paddy per month. In addition he also received one meal a day. An interesting carry-over of the 18th century tradition were gifts during Deepavali and Pongal festivals. The former consisted of a small amount of oil (about 75 ml) and some soap-nut powder for the ritual bath. During the latter, he was given some clothes (one loin cloth and one upper cloth, known as *veshti* and *quddai* respectively) and a meal During harvests the *padiyals* were collectively allotted 6.4 kgs of paddy per day's threshing. All these three payments, interestingly enough, were known as *merei* (a corruption of the word *murai* meaning custom), which was exactly the term used to describe the payments made to the servants in the 18th century.

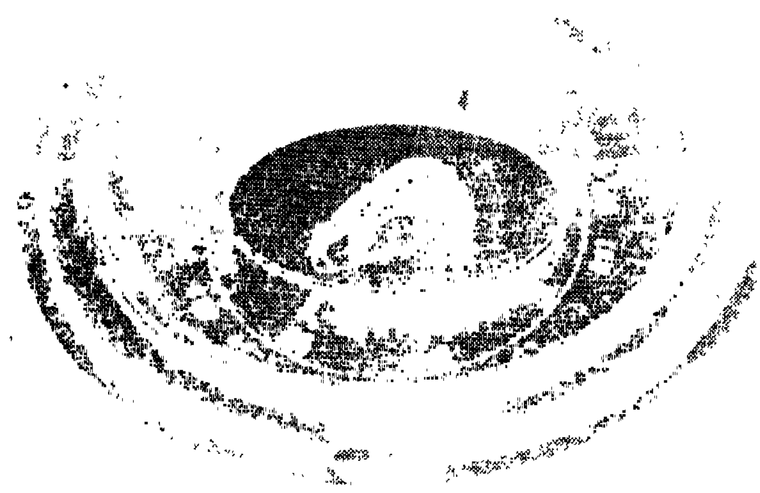

TABLE 2 : DISTRIBUTION OF PER CAPITA OWNERSHIP AND OCCUPATIONAL HOLDINGS AMONG DIFFERENT CLASSES OF PEASANTS—ASTHAPURAM-KANTHAPURAM (1916-1976)

Class	1916		1946		1976

(13) Pandithan	2	1 0	1 0	2	—	2.00
(14) Vannan-Meljati	3	—	—	3	6.55	6.55
(15) Villi	1	—	—	1	—	—
(16) Vedan	1	—	—	1	—	—
(17) Oddan	—	—	—	1	—	—
(18) Parayar	78	4.0	136 0	116	41.80	159.44
(19) Chakkili	1	—	—	1	—	—
(20) Vannan-Kiljati	—	—	—	1	—	—
(21) Total	160	777 0	777.0	230	622 72	707.00

Notes : (i) The shortfall in the total ownership holding in 1976 is due to the fact that we do not possess exact figures on the land owned by absentee landlords. All that we know is that such lands amount 84 28 acres and the tenants claimed that most of these landlords were Mudaliyars.
(ii) The 'traditional' occupation is given in Table 4.

Source : Same as Table 1

About the time a *padiyal* became too old for efficient work, he was retired off with an acre or two or three of land for share-cropping. At this stage he came to be called *sukhavasi* or *sowasi* (a corruption of the former).[46] Since this erstwhile *padiyal* had invariably not repaid the loans incurred or had even incurred further loans, his son or nephew went to work for the *ejaman* or master.

At least 30 of the 46 petty peasant households of 1916 were *sukhavasis* of this type, and 24 of them had been retired off by TM himself.

The relationship between the servicing households and the *ejaman* (i e, TM) followed a non-contractual and traditional pattern. In 1916, there were three washerman and two barber households, and one each of smith, potter, rat-catcher, fisherman-cum-basketmaker, and cobbler households. Eight of the Parayars were *vettiyans* or irrigation attendants. The payments made to these servicing households were also known as *mereis* or *swatantram*. The potter got one sheaf of grain with hay from each cultivating household (excluding untouchables) in addition to his earnings from his *inam* (*manyam*) land.[47] All the eight vettiyans were given two sheaves of grain with hay per *kani* (1.33 acres) of the land irrigated. In addition three of them had amongst them four acres of *manyam* land. The washerman households received two sheaves of grain with hay from each landowning household. The barber household also received the same. The smith household received two sheaves of grain with hay per *kani* for each crop. The two tribals, the Villi and the Vedan (the rat-catcher and the fisherman-cum-basketmaker, respectively), received one bag of paddy each per year contributed collectively by all landowning households. The cobbler who repaired the leather irrigation bucket called *saal*, and supplied one pair of footwear per landowning household per year, received two bags of paddy again collectively contributed by all the landowning households.

Let us now consider the jati element at Asthapuram and Kanthapuram. Tables 3 and 4 show that Brahmins and Mudaliyars put together owned nearly 600 of the 777 acres of land in the two villages, although they comprised less than 13 per cent of the households. We may also note that a third of the big peasant households came from lower jatis such as Pandaram, Idayan, and Palli. However, they still owned only 133 acres of land put together and were dwarfed by the Mudaliyars (480 acres). This picture of the emergence of other jatis (particularly Palli) as big peasants under the Mudaliyar hegemony was characteristic of Southern Chengalpattu at that time.

The Pallis and Parayars (untouchables) were the only jatis constituting the landless peasant class. Here again it is an important continuum from the 18th century, notwithstanding the different terms under which they were employed at this time. Further, as in the 18th century, the Brahmins did not employ Parayars. The *padiyals* and the *sukhavasis* employed by the former were all Pallis. Thus while the production relations had changed, there was little change in the pattern of jati dominance.

There are also certain other indicators of this. For example, the distribution of water from the irrigation channel originating in the spring five miles away, was still done on the basis of the *vatta murei* scheme which prescribed that water distribution should follow the ritual hierarchy: temple lands, Brahmin lands, Mudaliyar lands, and so on. Further, the 64 acres of temple land was under the control of TM, who had just wrested it from the hands of

GREAVES
GREAVES: multiproduct service to industry
Providing the finest engineering equipment to Indian industry has been a constant endeavour of Greaves. In pursuance of this policy, Greaves, over the years, have developed a broad marketing base with its business associates both in India and abroad. As sole concessionaires for internationally and locally well-known companies, Greaves have brought advanced technology to India in the vital areas such as aviation, agriculture, construction, electronics, marine, metals, mining, oilfield, power, shipbuilding, etc. Today, it has grown into a multi-product engineering house
But equipment alone does not make an organisation. Greaves also has outstanding technical and managerial skills built over the decades. Greaves is playing it's role in the rapid industrialisation of India.

a Brahmin. TM's Mudaliyar subordinates cultivated this land.

The other aspects of social relationships between the dominant jatis, particularly Mudaliyars, and their subordinating jatis were said to have followed according to "age-old customs". For instance, the Parayar had a right to beat the drums during Mudaliyar funerals and during the upper-caste Mariamman festival. They also had a right to erect the outer pillars of the marriage pandal in a Mudaliyar household. For all these, they were paid certain *mamool* (the customary reward). During certain auspicious days during the year, the Parayar had a right to sing in front of the Mudaliyar households in return for which they were provided some ragi gruel. The Parayar would also formally invite the Mudaliyars to witness the performance of the annual *koothu* (folk drama) and the latter were expected to graciously decline the invitation after making a donation.[38]

The barber's wife was the go-between in the negotiations prior to a Mudaliyar marriage. One of her tasks was to inspect the physical normalcy of the bride-to-be, under the ritual pretence of dressing her up. The barber himself performed an important role when he ritually purified a dead Mudaliyar with his last shave before the funeral. For all these "rights", there were special rewards.

The washerman's wife had the "right" to be first to change the clothes of a Mudaliyar girl who attained puberty.

The Asari and the Udaiyar likewise had the right to perform certain functions — e g, when a Mudaliyar built a new house and conducted the *graha-pravesam* (house-warming) ceremony.

It is possible to view all the above functions performed by the subordinate jatis as social obligations rather than as "rights". However, when the older members of the subordinate jatis whom we met in 1976 talked to us about these practices during TM's time, they said that these practices gave them a sense of importance and even indispensability *vis-a-vis* their patrons. As one of the barbers in his 70s told us, "We are not pure, but a Mudaliyar, when he dies won't be much purer than us if we did not shave him then. Therefore when I shave a dead Mudaliyar, I am doing him a favour. As long as he and I are from one village, it is my right to do him good." The periodic occurrences of such ritual practices also seemed to neutralise to some extent the weight of hierarchy in the minds of the subordinate castes. Referring to the large number of times he had beaten his drums in Mudaliyar funerals, an old ex-*vettiyan* (in his 80s) said: "I beat my drums to say to the world 'here is a good man passing by, and if he has been bad forget about it; he is dead. Whether good or bad, can he go this way without a Parayan beating the drum?' "

Whatever the compensation afforded by these periodic practices, the rules of purity and pollution, and the rigidity with which they were followed ensured that the subordinate jatis maintained their distance from the Mudaliyars. Even amongst the subordinate jatis, these rules appeared to have been followed down the line, contributing to the maintenance of ritual distance among them.

In 1916 therefore, Asthapuram-Kanthapuram appear to have been at the cross-roads. On the one hand, the new forms of property, commercialisation of agriculture and newer opportunities for economic mobility, and the consequent (new) class structure seemed to have created the basis for change in social relations. On the other hand, remnants of older social relations seemed to have lingered strongly; for instance, the Parayars still continued to refer to themselves as the *adimais* of the Mudaliyars. Further, the poorer Pallis still sought patronage from the well-to-do Brahmins as they did in the past. The continuation of other forms of patron-client relations, the rigid adherence to the ritual rules pertaining to inter-jati distances, the attempts by the economically mobile Pallis towards sanskritisation, and the continuance of older forms of rewards for the servicing jatis reveal the strength with which the legacies of the 18th century social order persisted. In other words the "collective conscious-

ness" or the "un mol common' of Asthapuram-Kanthapuram in 1916 seemed to have been characterised by the 18th century social syndrome.

III

Asthapuram-Kanthapuram in 1976

Table 5 gives us the distribution of different classes of peasants and other households among different jatis in 1976. In addition, Tables 1, 2 and 3 also provide us with a comparative picture of the two villages in 1916 and 1976. The most significant change as far as class structure is concerned is the emergence of the class of landlords (owning 174.23 acres of land) in 1976, and a proportionate fall in the share of big peasants. Most of the former's land (nearly 145 acres) belongs to people who combine non-agricultural vocations with land-ownership, and almost all of them are fully or partially absentee in status. This is symbolic of the extent to which market has penetrated over the years. The emergence of Chettiars as big peasants (both of whom are traders of considerable worth), the emergence of two Idayar big peasants as big landholders (who began with extensive interest in the mutton market and fire-wood market, respectively), and the fact that at least two of the Mudaliyar big peasants have invested sizeable non-agricultural earnings in lands, further substantiate this point.

In fact, even the poorest of the cultivators market at least 25 per cent of their output and the richest ones market 87 per cent of their output.[39] Also a sizeable part of the big peasants' assets is tied up in loans to the Madras film industry and urban real estate.[40]

The very character of big peasant production and economic calculations underwent a drastic change in the 40s, leading to the emergence of the dynamic and enterprising big peasant today.[41]

Substantial changes have occurred in the class relations of the big and landless peasants. The *padiyal-sukhavasi* system of the past has yielded place to one dominated by the coolie or daily wage earner. While 52 out of 71 landless peasants of 1916 were *padiyals*, only 20 out of 104 of the landless peasants in 1976 were *padiyals*. The character of the *padiyals'* functions has also undergone a drastic change. None of the *padiyals* today is a bonded servant. His status is one of an overseer-cum-handyman on a monthly salary. Some of the big peasants are even experimenting with cash salaries for the *padiyals*. While demographic factors have been important in bringing about these changes, the fact of commercialisation of the employer-labour relationships is equally significant.[42]

Commercialisation has also seriously affected the relations between the servicing households and the big peasant households Over the years, increasing number of villagers have gone into the use of aluminium and stainless steel vessels, which has forced the Udaiyar household into destitution. Today they not merely do not receive their *merei* or *swatantram*, but in their destitution have lost their land as well. The *vettiyans*, the barbers, and the washermen have also lost their *merei* With the advent of pumpsets, many big peasants and medium peasants have attained a degree of independence not only from the vagaries of nature and also from the regulations pertaining to the communal irrigation scheme. In the mid-60s, the big peasan's persuaded the village panchayat that the services of four of the eight *vettiyans* were redundant. Soon, the four ex-*vettiyans* mortgaged and sold their *manyam* lands, in order to meet their consumption expenditure. The four *vettiyans* who remained are sharecroppers on the side It is also reported that these individuals are secretly in the pay of the big peasants "for taking care that enough water reached their lands".

Survival or even prosperity of the servicing households now depends upon their ability to adapt their "traditional" occupations to the prevailing market conditions. The washermen are

a case in point. All the three washermen in the village now work for clients in nearby urban areas (even Madras). One of them, after managing to get his son an attender's job in the Chengalpattu Medical College and hospital complex, has ensured himself a long-term contract to launder clothes. This household now owns over six acres of land. The other two washermen households have acquired four to five acres of land each on mortage. The ability of the washermen to provide cash loans upto Rs 500 on demand in the usually cash short village economy has made them important creditors to small cultivators who have to borrow to meet their cultivation expenditure.[43]

Another occupation which promises a steady inflow of cash is that of the arrack seller. With the attainment of "freedom" by the landless peasants in recent times they are forced to purchase their own arrack.[44] The two Gramani households are doing such thriving business that six Parayars and five Pallis have gone into this as well.[45] The Gramani households have also acquired nearly six acres of land and several dozen brass vessels on mortgage.

One of the barbers has been working as a roadside barber in Madras on weekends to augment his income. He is also a small share-cropper and is reported to be distilling arrack on the side. The other barber is too old for such enterprises and in the absence of his *swatantram* is nearly destitute

With the advent of more intensive cultivation of land during the last dozen years, the smiths are very much in demand. They, therefore, not merely get their *swatantram*, but also receive labour charges for "extra work". They have also gone into carpentry during recent times, as they find it lucrative.

A brief comparison of Tables 4 and 5 shows us that the number of servicing and other households pursuing other occupations has doubled since 1916. It is interesting to note that while eight of these households of 1916 have sunk into destitution (the rest having prospered), the 13 new households are performing lucrative but "non-traditional" occupations. For instance, eleven of the thirteen arrack and toddy sellers are Pallis and Parayars. Five of the six traders are not Chettiars, but belong to Mudaliyar, Palli, and even Parayar jati.

This brings us to the position of jatis in 1976. As in 1916, the Mudaliyars continue to be the dominant landowners even in 1976. The emergence of business and urban based Mudaliyar landlords who own over hundred acres of land since the 1940s is a new phenomenon. The Brahmin households left earlier, when their members acquired government jobs. By 1976 most of their lands had been sold. These two occurrences are a part of the happenings in the region itself: first members of the Brahmin and next the dominant peasant jatis are said to have left rural areas for urban centres during the first half of this century.[46] We are informed that the Pallis' emergence as dominant landholders in rural Southern Chengalpattu occurred in the void created by the departure of many Brahmins.[47] In Asthapuram-Kanthapuram, a part of the Brahmins' land was bought up by a Palli and the rest by Mudaliyars. In general, Pallis of Asthapuram-Kanthapuram have been atypical in that over a period of time they have lost their land to enterprising Idayar big peasants, whose case has been seen earlier. The period 1945 to 1976 has been, in fact, the era of the rise of the enterprising big peasant, irrespective of jati background. For even amongst the Mudaliyars, barring two, none of the big peasants of 1976 is a descendant of big peasant households of 1916. From amongst the big peasants of 1916 in general, only six of the 15 households continued in the status by the third generation.

The rise of Parayars as landholders in 1976, is historic, granted the taboo which existed against their right to own land in the previous centuries. Thus the fact that they own only 42 acres of land put together, must not be ignored as a mere minor statistic. The emergence of some of the Parayars as the leading medium peasants alongside the Pallis is also significant. The fact that landless peasants are spread out among four jatis, as against two in 1916, is important in itself, and should not be under-played in the light of the still continuing numerical preponderance of Parayars and Pallis (respectively) in this class.

In short, significant changes have occurred in the class structure, production relations, and the class-jati nexus itself in the last 60 years. To what extent such changes have affected the structure of interests can be seen only if we discuss the cognitive world at Asthapuram-Kanthapuram in 1976.

IV

Cognitive World at Asthapuram-Kanthapuram, 1976

The ensuing discussion will be centred around three aspects of the cognitive world, namely, the notion of class, the notion of jati as hierarchy, and finally the world of politics.

Notion of Class

Do the people of the two villages perceive themselves as being differentiated along class lines? Apparently not. For instance, during our last three years' acquaintance with the people of the two villages, we have been struck by the singular absence, in their day-to-day language, of words describing important production relations in class analysis. For example, there are no equivalents for 'landlord', 'tenant', 'labourer', 'rent' and 'exploitation' or 'appropriation'. This is not to say that Tamil language itself is devoid of words conveying these concepts; nevertheless, the existing Tamil words (often evolved by over-enthusiastic Marxists) are unintelligible to a large majority of rural folk in Southern Chengalpattu. The word *nilachuvandar* is used by Marxists to refer to landowners, but is alien to the vocabulary of Asthapuram-Kanthapuram. Here a landless peasant usually refers to a big peasant by his given name and jati, e g, Sundara Mudaliyar or Kishta Naicker. A more diffident person might use such forms of reference as *Periya* Mudaliyar (the big Mudaliyar).

Likewise, 'tenant' has no equivalent Most of the share-croppers and 'tenants' still continue to refer to themselves as *sowassi* or *sukhavasi*, terms which are carry-overs from the distant past. To some extent, this is still justified, since in relation to a landless peasant, a share-cropping petty peasant is still a *sukhavasi*, and (as one of the big peasants explained to us ironically) he still exists (*vasi*) for the *sukham* (pleasure) of the landowner. Share-cropping itself is described as cultivation for *waram* (output sharing). However, it may be recounted that in the 18th century, the entire village output was divided into *warams* (shares), such as *melwaram* (the overlord's share), *kudiwaram* (the subject's share), *tunduwaram* (the village lord's share), and so on. Thus the term *waram* indicates an output share only, and does not connote superior-inferior rights which 'rent' connotes. This is further illustrated by the fact that many persons (rich or poor) take on cows, pigs, goats, chicken, and even trees on *waram* basis. The urban terms of *kudacoolie* or *vadagai* apply to hire charges on man-made objects only, such as a house or a bicycle. Cash

payments of 'rent' are known as *kuttagai* or *guttagai* (corruption of the former), but symbolically enough cash payments of rent hardly exist in the two villages.

The common Tamil word used in reference to a labourer in the organised and unorganised production centres in urban areas is *tozhilali*, but, in the rural areas of Southern Chengalpattu in general and in the two villages in particular, *tozhilali* refers to smiths, barbers, washermen, and potters. The connotation being that a *tozhilali* is one who depends on the skill of his hands alone for his living, an agricultural labourer who depended on the mercies of his employer and vagaries of nature, was not entirely a *tozhilali*. A daily wage earner and a permanent farm hand refer to themselves as coolie and *padiyal* respectively. In both senses the concept is that of an 'unfree' labourer, notwithstanding the demise of the *padiyal-sukhavasi* system, as we shall see shortly, a landless peasant is not quite free.

Surandal, kollai, etc, are words used by Marxists to refer to exploitation. However, aside from their ethical connotations, these words which mean cheating and burglary (or dacoity), respectively, hardly convey exploitation as a scientific derivative of social perception. In the two villages, these two terms are used in a number of contexts referring to a number of acts or occurrences such as work-shirking by a coolie (*surandal pervazhi*, cheater), a young woman getting widowed soon after marriage (*purushanai kollaikondal*, looted her own husband's life), and loss of a part of the body (*kannu kollai pochchu*, literally meaning, eyes were stolen).

Thus the cognitive categories referring to economic relations in the two villages do not lend themselves to an articulation of economic relations along the lines of class analysis. It might be argued by some that this reflects only the time-lag in the social perception of the people of the two villages. From what has been discussed so far, however, it is evident that the prevailing cognitive categories indicate the continuing influence of the legacies of the past.

The break from the past, as already noted, is in terms of the changes in the character of the big peasant agriculture and some Parayars becoming land-holders. These occurrences appear to have affected the attitude towards wealth and poverty right down the line. It is now common to see even a very poor Parayar dreaming about a few acres of land and some cattle as his own property. That such dreams were certainly not common in 1916 is illustrated by the following statement of VM (son of TM): "Look at D! Could you imagine such a thing happening during TM's time? D's father was my father's *padiyal* and now D's son has been to college and goes around the *paracheri* in a suit like a *dorai*. D's father could not have dreamt of owning a single acre of land during my father's time." (D is the most prosperous among the Parayars and owns eight acres of land. *Paracheri* is the residential settlement of *Parayars* located on the outskirts of the village. *Dorai* means an English official.)

VM's reflections are echoed by K, an ex-*vettiyan*, who said: "During those days we did not own even the *nattam* on which we live." *Nattam* refers to that part of the *purambokku* (communal waste) lands which are earmarked for building sites in the revenue records. Even today, many of the *nattam* lands which are owned by the Parayars are referred to as V Mudaliyar's *nattam*, or B Mudaliyar's *nattam* and so on, thereby reminding us that till a few decades ago the Parayars did not own even the sites on which they built their huts.

This is a major break from the 18th century situation wherein jati, kinship, and lineage, pre-ordained economic opportunities for one and all. Even in 1916, while all other jatis including Pallis had broken through these constraints (or at least could do so), the Parayars were still constrained. Today, as long as resources permit, there is no constraint on anybody's economic opportunities. The common attitude from a Mudaliyar big peasant down to a Parayar landless peasant seems to be that enterprise and resources lead to wealth, whereas penury and foolishness lead to poverty and weakness. The following conversation between SM and one of the authors illustrates this point. The author and SM were standing on the bund watching coolies transplant paddy.

Author: This looks like Ponni. Have you been planting this variety of paddy for quite some time?

SM: Yes, it is Ponni. This is the third time I am sowing it. There, next to the coconut tree by IM's land, I have two acres of IR-20. And there, to the left by SP's land, you see two-and-a-half acres of good Samba.

Author: I did not know you own those lands as well. Is it not a nuisance to have different plots of land scattered around?

SM: These lands were given to my father as dowry when he married TM's niece. Those days, it never occurred to people that holdings must be in a consolidated lot. If I had these lands together, I will employ a tractor.

Author: Does it mean that it is only your generation which is conscious of better use of land?

SM: Even my father liked to grow a good crop. But it is only my generation that is conscious that it is possible to go on increasing the yield of land. We are also aware that if we are 'smart' we will never face the financial crises our parents did.

The experience of G, a Parayar petty peasant, illustrates the same point. He incurred a debt of Rs 500, in order to spend half of it bribing a trade union official to get his son a job as a dock-worker, and the other half propitiating Mariamman (a female deity) with a goat for the same purpose. In the end, he discovered that he had been taken for a ride, and in the process had been left with a debt of Rs 500. The wrathful G went to Mariamman's temple and shouted at the deity "you widowed whore! I invested Rs 500 on the two of you. He ran away, but you cannot run away. Let us see who offers you a goat again." It is evident that G considered that he had made a business deal with Mariamman, and that she had cheated him. Thus even propitiating a God or Goddess is a form of investment. This and the case of SM substantiate the fact that from the rich down to the poor there is a feeling that it is enterprise and resources which constitute the avenues to prosperity.

Granted this awareness, it would seem logical that uneven distribution of resources would lead to bitterness and the emergence of class consciousness. As we have seen in earlier discussions, the distribution of land and other assets at Asthapuram-Kanthapuram is very highly skewed. Notwithstanding this fact, we were unable to see any traces of class consciousness among the poor in the villages. The jati divisions among the landless peasants have resulted in a split among them, often resulting in conformism to jati exclusionism to the detriment of class interest. For instance, all the bargaining for the increase in daily wages since the 1940s has been undertaken and

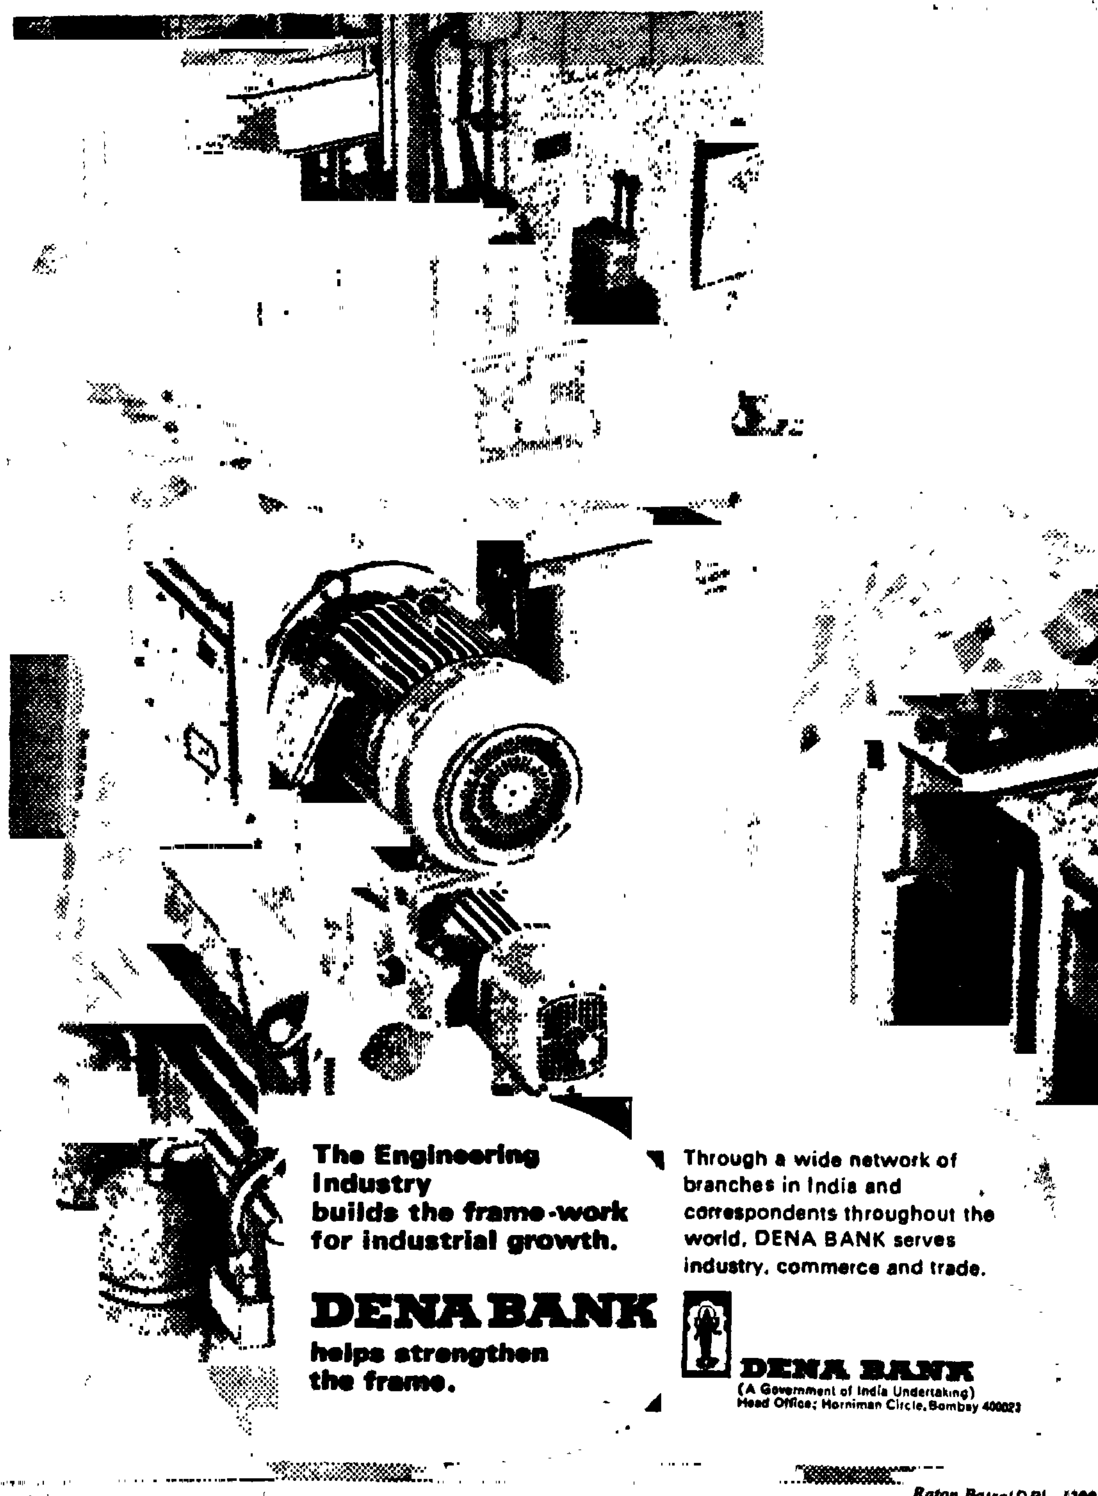
negotiated [illegible] the Parayars alone. The Pallis, on the other hand, stood by, or on occasions even sided with the employers, while at the same time reaping the rewards in the form of higher wages.

Nexus of Jati

Within the villages, jati as a factor appears to have weakened and grown stronger at the same time. The hegemony of dominant jatis over resources has come under question, ever since the Parayar acquired land. The patron-client relationship between the servicing jatis and the Mudaliyar big peasants has also been eclipsed. Finally, the emergence of factionalism among the latter and its spread among other jatis has also put an end to the Mudaliyar's control over irrigation water and temple lands.

While in 1916, the class-jati nexus was at the cross-roads, by 1976 new class relations had evolved, but jati remained at the cross-roads.

To illustrate this, let us first consider the case of Mudaliyars. By and large, they still observe ritual rules of purity and pollution with those whom they consider as being below them. During 1976, we witnessed an episode concerning the Mudaliyars persevering with jati endogamy under great odds: one of the Mudaliyar big peasants' boys had been having an affair with a young shepherdess from a medium peasant household. During the course of the affair the girl became pregnant and a dispute ensued, in which some powerful and wealthy underworld elements belonging to the shepherd jati demanded that the boy marry the girl. The Mudaliyars of the villages recruited the support of influential and affluent jati folk from several other villages, and successfully countered the demand of the powerful shepherds. In yet another case wherein a Mudaliyar boy ran way with a Chakkili (cobbler) girl and got married to her clandestinely, the boy was pursuaded to return. The marriage was declared to be null and void by both parents, since they both agreed that "a Mudaliyar could just not marry a Chakkili".



In the domain of purity and pollution, while the older generation of Mudaliyars still adhere to the rules, the younger ones do not seem to. For example, one of the Mudaliyar big peasant boys, whom we shall call LM, who is reputed to be a casanova, is known not to purify himself with a bath after sleeping with lower caste women. On one occasion when LM contracted influenza, SM (whom we mentioned earlier and who is in his 50s) told us: "It is not sleeping with them that is bad. But one must always have a bath. The ancient people did not make this rule for nothing. Look what has happened to LM." LM, and many other young boys of his jati, also inter-dine with lower jati people such as Idayar and Kanakupillai (accountant), which is another instance of transgression of rules associated with purity and pollution. Such transgression of rules by the younger Mudaliyar men seems to evoke both anger and protectiveness among senior Mudaliyars.

In general the jati situation is described by many Mudaliyars through common expressions such as "the times are bad". There also appears to be a growing cynicism about the individual jati member's responsibility for the transgression of others. The reaction of the Mudaliyars to the advent of pigs in the middle of the village characterises this (pigs are considered polluting and nobody except the Parayars, Chakkilis, and Oddars consume it). When the Oddar household set up its piggery in the heart of one of the villages, beside the Murugan temple, nothing seems to have been done to prevent them from doing so. However, every Mudaliyar household individually grumbles that "the others encourage the Oddars". The only collective action is one of collective hysteria on the part of Mudaliyars, each time the pigs stray towards the temple tank.

The Parayars, on the other hand, are undergoing a traumatic process of sanskritisation. Some of the earliest Parayars to come by land, switched over from the consumption of ragi to rice. Subsequently this expression of sanskritisation spread to every other household. This has led to physical debility amongst a large number of them, since rice is both poorer in nutrition and in calorific content.[48] In addition, a large number of these households have started observing upper caste rituals such as *amavasai* (new moon), and *kritikai* (the day of the star *kritika*). Our estimate of their consumption budgets suggests that in over 70 per cent of the households, the shift in cereal consumption and the observance of upper caste rituals has led to an additional 30 per cent to 40 per cent of consumption expenditure. Most strikingly, a demand for servicing households such as barbers and washermen has emerged. In the past the Parayars served each other as hair dressers, but now a barber comes from Chengalpattu town once in a fortnight to attend to their needs. Also in the past, the Parayars possessed very few pieces of clothing which they themselves washed. But now, one of the poorest households among them serves as a washerman, and many Parayar households do not have any commensal relationship with the latter.

This process of sanskritisation is a heavy burden on a large number of Parayars who are destitute coolies.[49] The feeling of jealousy towards the relatively well-to-do and the intense competition in the land-lease market amongst them, and the rivalry with each other for political patronage (details of this later) have resulted in a great deal of mistrust and bitterness. For instance, during 1976, one of the authors was trying to arrange for MFALA loans for 15 of them. During this process, the author had to take two or three of them to the BDO's office situated 14 kms away. He explained to them that he did not have enough money to pay for the busfare of all of them, and so only two may be chosen by them to go to the BDO's office. In the ensuing half an hour there was a sullen silence, and when the bus arrived everyone tried to board the bus. The author, once again, insisted on only two accompanying him. After curt exchange of words amongst each other, seven eventually boarded the bus with the author. Subsequently, each one of them explained that "the others were malicious fellows, who would deliberately sabotage other people's welfare".

Modern education adds to the embitterment, and alienates the embittered Parayars from the rest. D's son V studied three years in Madras, and returned after an unsuccessful attempt at the examinations. One of the authors' first meeting with V was bizarre: In the dilapidated *Paracheri*, one evening in 1976 he was accosted by a handsome young man in a beautifully cut double-breasted suit and exquisitely polished shoes. In broken English he said "how do you do, I, V. Good evening, sir. What are you doing?" After the author had explained the purpose of his visit, V said: "These idiot fellows, sir. All tell you lies. You come." He then took the author to a half constructed RCC structure and said, "My home. 25,000 rupees. My father not having money, so still building for two years". During the next half an hour,

he talked about his family, himself, and his frustrations. In broken English, despite attempts by the author to converse in Tamil, V spoke with terrifying venom about his father, and about "these idiot people". Subsequently we learnt from others about V's abortive attempts to buy a house in Mudaliyar's street, his forced seduction of several Parayar women and girls (in an attempt to emulate LM and other Mudaliyar boys), and his drunken violence. One of the Parayars who took pleasure in V's failure to purchase the house in the Mudaliyars' street said, with a malicious grin, "It does not matter how rich a Parayar you are. You cannot cease to be one. Where will you run? If you are rich, you build your palace in *paracheri*. This is your home".

When V's father D offered to contribute to the customary famine relief fund, during the bad crop of 1974-75, along with the Mudaliyars, the fund collecting Parayars scornfully turned down the offer.

In this situation of economic differentiation among the Parayars, of the decline of the *Padiyal-Sukhavasi* system, and in a situation of growing mutual bitterness and antagonism, the traditional jati leadership has collapsed. The *Pannaikarars* no longer command the respect from the well-to-do Parayar. They are no longer followed by the others who are impoverished, since they are no longer close to the patrons (since the patrons themselves are no longer what they were). There is a vacuum in leadership among them, which is conveniently utilised by the factions of the upper castes.

In this connection, it might be pointed out that there are two sides to the way Parayars feel towards Mudaliyars today. The bitterness which they feel over the lapse of the *Padiyal-sukhavasi* system is also focused against the Mudaliyar. Barring a small minority, the Parayars in general did not express either admiration or respect for any of the Mudaliyars in the village (excepting AJ, about whom more will be seen later) during their conversation with us. In fact, we were told "Mudaliyars these days do not behave like Mudaliyars". On one occasion, this bitterness even exploded into violence: LM's late father had a reputation of being a cruel and ruthless man among the Parayars. One day a Parayar boy, walking down the street where LM's father lived, whistled a film tune, at which LM's father promptly thrashed the Parayar youth. That evening a mob of Parayars surrounded LM's father's house and forced entry into the house. LM's father and two other Mudaliyar men who were in the house, escaped, and did not return for several days. The Parayars are said to have manhandled the women of the household, and then dispersed.

One immediate inference from this episode is that the Parayars would no longer take any nonsense from the Mudaliyars. To some extent this inference is validated by the fact that there was no retaliation from the latter. However, one of the persons who spearheaded the Parayar mob, said to us, "somebody had to teach him the proper manners of a Mudaliyar". Part of the anger of the Parayars was that LM's father dared to oppress without ever having conformed to the patron image which involved generosity, charity and kindness.

The destitution of the Parayars is the major reason why they still require patrons. Recently, one of the Parayars got converted to Christianity and was trying to convert several others too. He explained it thus: "Last year the padre gave so and so a thousand rupees to dig a well. If I convert enough people soon, I will also get some assistance".

Aside from sheer economic insecurity, the Parayars are also vulnerable *vis-a-vis* the forces of law. In their frequent disputes with Pallis (which will be seen shortly), they are often apprehended by the police. While the Pallis have influential persons in their jatis to help them out, the Parayars have none except the Mudaliyars. The ease with which a destitute individual can be "framed" on trumped up charges is to be seen to be believed. Therefore, it is likely that for a long time to come the Parayars themselves would seek to stay within the shadow of the Mudaliyars. That this has larger ramifications in the world of politics will be clear later.

Finally, about the Pallis. Perhaps, no where else is jati solidarity as intensely portrayed in Southern Chengalpattu as among them, although even this is on the decline. They are the only jati group in the two villages with a formal regional jati organisation, which is rigidly controlled by the jati leaders. Financial support to the jati organisation is provided by rich peasants and others among them. The leaders of the *nadu* council are elected by village leaders, who have the right of recall. The jati has several subordinate functionaries who are actually destitute persons permitted to beg from jati members. Some of these subordinates known as *naukars* are the bards of the jati who sing the praise of the jati during festivals. We were told by senior Palli peasants that the institution of beggars such as *paghal vesha karan* (a beggar who dresses in various costumes and comes begging for meal at midday) was meant to take care of the destitute within the jati. We were also told that in recent times with the population of the poor increasing and with lesser and lesser funds coming into the jati organisation from the well-to-do, the strength and solidarity of the jati organisation itself is on the decline. We saw two instances which indicate that while on the one hand there is a weakening of the jati solidarity (mainly due to competition for the fewer and fewer economic opportunities), there is also a compulsion to rely on the jati as the last resort. The first of these episodes concerns GN and HN, of whom the former was one of the caste elders. Both of them are masons, as many Pallis are. They had been competing with each other for a job which was going in the villages. GN was promised the contract. At the last minute, HN quoted a far lower price and was awarded the contract. On the day the construction was to begin, GN arrived on the scene not knowing that HN had already been awarded the contract. When the former learnt what had transpired, an argument ensued between them, at the end of which GN said, "I will see that you are punished in the *koottam*" (*koottam* is the jati council). HN retorted, "your *koottam* is not worth my pubic hair! Will they get me a job?"

The other episode pertained to a dispute between a Mudaliyar and a Palli, in which the Parayars were also involved. One of the Mudaliyar boys known to be a trouble-monger, was driving his bullock-cart along. When he came to a spot where the wife of a Palli had spread paddy on the road to dry (this is the way it is done in most of Tamil Nadu), he stopped the cart on top of the paddy. The Palli's wife told him that he should push along lest the bullocks urinate on the paddy. Before anything could be done, the bullocks urinated. In the quarrel that ensued blows were exchanged between the two. Soon her husband joined the fray. At the intervention of some others, the parties concerned traded abuses and departed. That evening a body of

Pallis, in a considerable state of intoxication, marched to the Mudaliyar's house. Anticipating trouble, the Mudaliyar boy waited in the street with a few Parayar share-croppers of his. The clash that ensued between the Pallis and Parayars was only verbal and after a while both the parties dispersed. The next day, father-in-law of the Palli woman said, "This fight is only a small issue. But it is a very serious problem. Mudaliyars own all the land and the Parayars do all the share-cropping. Unless we stand together, we are finished."

It is evident from the above two episodes that the economic insecurity among the Pallis has the dual effect of weakening and at the same time reinforcing their jati solidarity.

This leads us to the situation of confrontation which exists between the Pallis and Parayars. While the former have a sizeable number of wealthy and politically influential big peasants in Southern Chengalpattu, the majority of them are landless and petty peasants. It is the same situation at Asthapuram-Kanthapuram as well. Two of the hamlets adjacent to the two villages are single jati Palli settlements. Some of the Palli big peasant households in these hamlets, both of which come under the Asthapuram panchayat (as does Kanthapuram), are politically influential in the panchayat. At the same time, most of the Pallis of Asthapuram-Kanthapuram are landless or petty peasants, as has been noted earlier. A majority of them have to compete with an even larger number of Parayars for the limited amount of land available for share-cropping. In the last few decades, the 'liberation' of the Parayars compounded with population increase, has further intensified this competition.[50]

In Asthapuram-Kanthapuram the exit of Brahmin landowners and the continued dominance of Mudaliyar landowners, who prefer Parayar share-croppers to Pallis, has rendered the problem even more acute for the latter. Finally, the new tendency of the big peasants (since 1940s) to lease out less and less land, has considerably reduced the area of land available for lease from them. Simultaneously, the cost of petty-peasant cultivation has gone up, due to the compulsion by the landowners to use at least a minimum amount of fertilisers.[51] The petty peasants are aslo forced into a vicious circle of indebtedness and forced marketing of their output.[52]

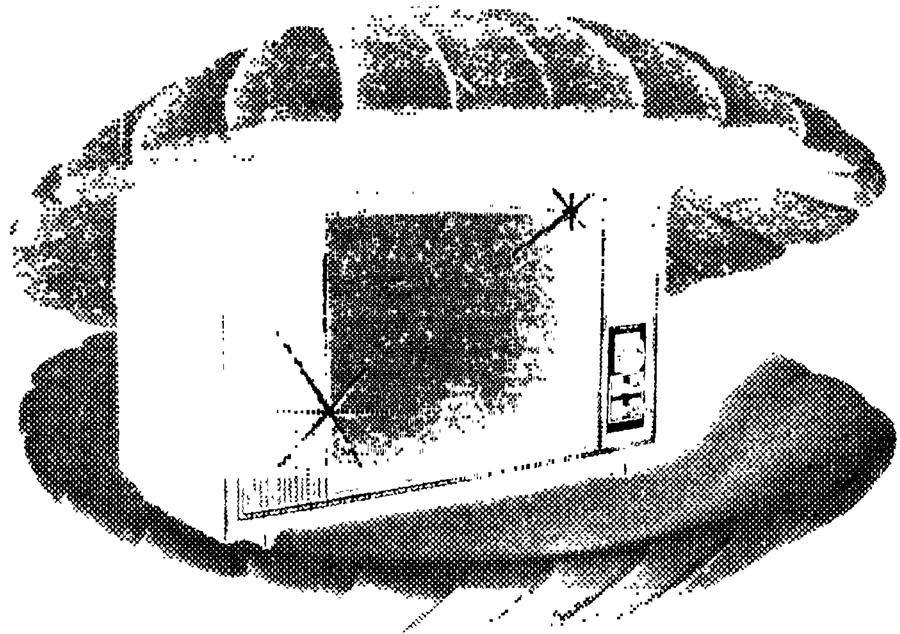
The situation of the landless peasants and the competition among them reveal a more or less similar picture. All these factors have rendered a sizeable proportion of the Pallis as destitute as the Parayars. As one of the Pallis said to us, "The Palli woman has to work shoulder to shoulder with a Parayar woman in the same field."

It appears that in a situation of competition and identical state of destitution, the loss of the opportunity to maintain even jati distance, seems to be the last straw. Aside from the need to (literally) rub shoulders with a Parayar there are other things which upset the Palli further. For example, the fact that some Parayars come to drink at the Palli-owned arrack shop, although the latter never visit the former's arrack shops, has added another edge to the Pallis' irritation (that the Parayars started arrack shops in competition was bad enough). Further, the permission given 20 years ago for the Parayar women to come to the irrigation tank during the fishing season (the Pallis stopped fishing in the tank immediately) meant an "unjust" deprivation. Lastly, the rapid sanskritisation of the Parayars threatened the Pallis with the possibility of an eventual loss of all claims for ritual superiority over the former. This complex set of factors has led to a continuous animosity between the two. As a reaction to the Pallis, the Parayars are getting increasingly militant. During one such conflict in 1978, the armed confrontation between the two had reached such proportions that members of neither jati felt safe along the Chengalpattu-Tirukazhukunram road for some weeks. There is no reason to believe that the conditions underlying the conflict between the two jatis will change in the near future. What we have seen so far seems to indicate that it may even heighten.[53]

In sum, we may conclude that while the proliferation of market seen earlier has engendered new production relations, it seems to have created the bases for new jati equations. Further, at least at the present stage, the forces unleashed by market seem to work in contrary directions. What patterns of group formations and linkages this leads to can be understood only by studying the world of politics.

World of Politics

It has been seen that in many respects the material bases for the older forms of jati-based dominance in the village no longer exists. It has also been seen, however, that jati equations themselves are in a process of realignment, and that there is no discernible emergence of class affiliations. The implication of these for the of politics is that there are elements of change as well as continuity as far as political alliances, factions, and patron-client strategies are concerned.



In what follows we shall discuss politics in the villages, the people's perception of the state, and modern political processes such as elections.

It was seen that around 1910 the dominant jati politics in the villages centred around control over temple lands. With the exit of Brahmins from the villages during the 1930s, the struggle for control over temple lands split the Mudaliyars into two factions.

With the advent of Panchayat Raj in the 50s, village politics acquired additional dimensions. Around that time, multi-caste factions appear to have emerged (the reasons for this have already been seen). By about the Mid-50s, the Palli big peasant from the neighbouring hamlet (whom we have already referred to) captured power as the Panchayat President. Around that time, the son-in-law of one of the Mudaliyar big peasants of Asthapuram-Kanthapuram villages also entered the political arena of the two villages. Until his arrival, the Congress Party held sway over the two villages, having as its members Mudaliyars as well as Pallis. The young son-in-law (whom we shall call AJ) brought the DMK to the village and with it the Tamil 'socialism' (populism?) of Annadurai and other leaders. AJ now has complete dominance in the two villages and is a parliamentary secretary to the AIADMK ministry at Madras.

The success story of AJ, reflects the dynamism and fluidity of multi-caste factionalism. It involves winning the Parayar support through patronage, egalitarian rhetoric and establishment of leaders amongst them. It also involves utilising the dissenters among the Pallis to win a sizeable backing from them. And finally, he has united the Mudaliyars in an informal anti-Palli faction. All these have involved an acute perception of the prevailing concepts of State, and the reorienting patronage-clientele on more personalised lines.

It would not be wrong to describe the prevailing awareness of State among the people of the two villages as one of the patron of patrons. Government is perceived as an abstract entity, doling out various favours and privileges and

meting out punishment. It is not seen as a body of people who (at least, hypothetically) are meant to execute popular aspirations. In this sense, there is the same awesomeness[34] about government as there is about a local deity. The difference of course is that petitioning for the favours of a deity involves merely a few relatively simple offerings such as betel leaves, coconuts, a chicken or a goat, or even hair, and at best a cow or two. The pujari is also a neutral person in the sense that as long as a few rules are followed, he cannot influence the god against you.

Petitioning the government on the other hand, involves, a complex set of obligations, generally consisting of being a member of an interest group, and keeping happy the patrons immediately above, whose tenure and whims are indeterminate. The interest groups to which a person attaches himself might vary. For instance, a person wears the mask of jati when it comes to benefits and privileges accruing to "Backward Classes" and "Scheduled Castes". He puts on the mask of a tenant or the small farmer when it comes to tenancy legislations or SFDA loans. He wears the mask of the poor when it comes to free medical, educational, and other assistance.

The patrons consist of a wide range of government functionaries, elected politicians, and other persons of influence such as a kinsman of an official, or the jati fellow of an official or politician. The fact that elected politicians have limited tenures makes them depend on established interest groups in the society, and keeping their requirements met.

Here jati acquires considerable significance. While on the one hand, the jati interest is a given factor which a politician cannot change within his limited tenure, he finds it necessary to reward jati interests for the longevity of his own tenure. An important factor constituting a reward is appointment, posting, and transfer of members of jati within the officialdom. Thus jati groups thrive over time.

The logical outcome of this process is the emergence of jati conglomerates at the regional level. This facet of the political process is contrary to another facet, wherein at the local level intra-caste factionalism leads to alliance groups of multi-jati nature. AJ's initial success, as we have already mentioned, was the forging together of an effective multi-conglomerate in the twin villages, to the detriment of the Palli jati based political groups. His subsequent success as an MLA was, however, based on large scale support of Pallis, who are numerically preponderant in the Southern Chengalpattu region as mentioned earlier.

AJ's present predicament is one of trying to reconcile his multi-jati approach with the need to meet the demands of Pallis. Already, many non-Palli residents of Asthapuram-Kanthapuram have begun complaining that AJ is partial to Pallis, and Pallis elsewhere claim that AJ is helping only Mudaliyars and is friendly only to the Parayars. This predicament illustrates the contradictory nature of the relationship between jati and politics at two different levels. What we have not discussed so far is the way in which the class factor is linked in the process. Most leaders of the dominant jatis in this region are either big peasants or well-to-do traders. Invariably, they are either themselves political leaders or important sponsors of the former. In the process of their role as vote-brokers, these individuals expect and receive a number of benefits beginning with government contracts, and ending with jobs or seats in prestigeful courses such as medicine and engineering. It is interesting to note that the big peasants' involvement in politics is on jati lines rather than on class lines, and such a political involvement is an important factor in their consolidation of their individual class position.

In recent times certain all Tamil Nadu "class based" organisations have emerged, such as the "Tamilnadu Vyavasayigal Sangam" which is said to be an organisation of the well-to-do peasants. To what extent such organisations reflect the emergence of "class" solidarity as an important force is difficult to say. It is, however, clear to us that such organisations cannot be free from jati ramifications at least for some time to come. For example the three representatives of this organisation in Southern Chengalpattu who met us in 1978 were all Pallis. A similar line of reasoning will be valid in the case of left parties' peasant organisations. We have been informed that jati is an important factor in both the setting up of village bases and in the party hierarchy itself. It might be interesting to enquire into the extent to which single-class-base areas of the leftist movement are also single jati areas.

Conclusions

To sum up, we have considered at some length the domains of the social and cognitive world at Asthapuram-Kanthapuram, namely those of class, jati and politics. Notwithstanding the evolution of class structure since 1916, and notwithstanding the drastic changes in production relations since the 18th century, we find that the cognitive world is not characterised by "class consciousness". The consciousness, if we may hazard the use of such a value-loaded term, is highly complex with elements of awareness of the consequences of the distribution of income, intermixed with a reinforced awareness of ritual distinctions pertaining to jati. This element of cognitive dualism manifests itself particularly strongly among the "have nots".

In the world of politics there is a dualism of strategy. Local level strategy takes the form of a patron-client relationship, the elements of which cut across jatis. At the regional level, however, jati conglomerates become far more significant. The dilemma of political mobility then is the need to balance these two. The class connotation of politics then is one of continued benefits to the well-to-do, only as long as the latter continue to occupy the leadership of their jatis.

Our discussion of class-jati nexus from the 18th century to 1976, and our conclusions raise some interesting questions. (1) Is it possible to think of jati as only an element of the "superstructure"? (2) Is it possible to think in terms of an all-India "mode of production", without taking into account the specific regional-historical significance of the class-jati nexus? (3) Is it meaningful or wise to raise the slogan "down with jati"? (4) Is there any rational manner in which the present day class-jati nexus can be linked to the centre-periphery theory of the world-capitalist order? (5) Given the nature of the class-jati nexus and given the structure of the State in India today, is there a possibility of anything more than "populism" emerging?

The difficulty of seeking answers to these questions leads us back to an equally complex question posed by a petty-peasant at Asthapuram-Kanthapuram. After a long night's discussion of the happenings in the Peoples' Republic of China, we stated, "Is there anything not possible for a people?" Our friend queried in return: "If the bullocks and the driver sit on the cart, will the cart run on its own? The driver is the leader, the leader is the upper jati. How do the Chinese manage

without jati?"

3 See for instance, Djurfeldt and Lindberg (1975). Also see S S Sivakumar (1979a).
4 For instance Epstein (1962) and Bailey (1957), have attempted to relate jati to changing economic conditions. However, even from these works we are unable to get a proper idea of the nature of the economic significance of jati, in the sense that economic relationships are not viewed in terms of class relations. Even more recent works such as that of Chakravarti (1975) suffer from the same lacuna.
5 Sivakumar (1978a) and (1978b).
6 Sivakumar (1978b).
7 Sivakumar (1977).
8 Official revenue records of the last quarter of the 18th century are full of references to paddy alone and not to any other crop. See "Chengalpattu District Records" (1785-1800).
9 See Sivakumar (1978b).
10 See Sivakumar (1977).

13 Place's Report, *op cit.* Also see "Chengalpattu District Records", vol 440, pp 118, 153-154, 408, and 415.
14 Sundararaja Iyengar, (1921).
15 For numerous illustrations see "Chengalpattu District Records", vols 440, 441, 442, 444, and 445. During 1976-77, we came across an ancient method of water distribution known as *vatta murai*, according to which irrigation priorities were allotted according to a person's place in the ritual hierarchy — for example, the temple, Brahmins, Mudaliyars, Chettiyars and so on, down the line.
16 See, for instance, numerous cases of dispute regarding management of temple lands in "Chengalpattu District Records", vols 440-445. For a more detailed analysis of this issue, see Baker and Washbrook (1975). Our own experience in Southern Chengalpattu during recent times shows us that temple lands which are the best lands have always been the bone of contention among lineage and jati groups, historically.
17 An *ulkudi* (a resident *payikarie*) could, with the support and permission of local *kaniyatchikarars*, become a *kaniyatchikarar* himself. See for instance, for an interesting dispute on this issue, "Chengalpattu District Records", vol 440, pp 118, 153-154, and 214.
18 The famous episode pertaining to Tirumazhisai (Trimashee) wherein such desertion "rights" were used by the *kaniyatchikarars* against the collector. See "Board of Revenue (consultations) Proceedings", vols 147, 148, 149 and 150. This dispute and its implications are the subject of a forthcoming paper of the authors, entitled "The Trimashee Dispute: A Note on Economy and Society in Eighteenth Century Tondaimandalam". A brief summary of the dispute is also provided in Sivakumar 1978 (b).
19 See, for instance, "Board of Revenue (Consultations) Proceedings", vol 149, p 3,390.
20 This was the way in which jati organisations were organised at the *nadu* level even in 1976. We were told by jati elders that this has been so from "times immemorial". Tamil literature of the Sangam period (2nd to 5th century AD) also has reference to a system of ballotting known as *kuda volai*, at local levels.
21 See note 15 above.
22 "Chengalpattu District Records", vol 441 (pp 31, 32, 89, 109, 110, 111, and 114) vol 442 (pp 158, 159).
23 We have no direct evidence on this for Tondaimandalam. However, in Cholamandalam, where also *kaniyatchi* prevailed, permission of leading members of dominant jatis was required even during the reign of powerful monarchs such as Raja Raja, Circa, 10th century. See, an interesting inscription presented in the Appendix to Bailey and Huddleston (1892).
24 "Chengalpattu District Records", vol 442, pp 229-31.
25 One such person known as Papa Iyer was owed more than one million star *pagodas* by the Nawabs of Arcot (around 1785, one *pagoda* equalled rupees 3.5). See the "Fifth Report of the Commissioners on the Private Creditors of the Late Nawabs of the Carnatic" (1810).
26 See note 18 above.
27 For numerous instances, see 'Chengalpattu District Records" vols 440-444.
28 Place's Report, *op cit.*
29 Sivakumar, (1978b).
30 *Ibid.*
31 On the extent of commercialisation, interesting details are available in Ratnam (1966).
32 For details see Irschick (1969).
33 Sivakumar (1978a).
34 Detailed analysis of this has been made in Sivakumar (1977).
35 See for instance, Slater (1918).
36 The term *sukhavasi* has been interpreted by older Parayar peasants of 1976 as people who were better-off in relation to *padiyals*. Interestingly enough, the term as it is used in present day urban Tamil also refers to people who do not have to perform drudgery for a living.
37 The *inam* of the servicing jatis was abolished by Acts II and III of 1892-93. Thus, although the potter's land was, out of habit, called his *inam*, in actual fact, he was a *ryotwari pattadar* like anyone else.
38 Interestingly enough, in 1976, only Pallis and Parayars were performing *koothu* or drama. Many Mudaliyar boys were interested in them, but they were afraid that actual participation might be infra-dig.
39 Sivakumar (1978a).
40 *Ibid.*
41 Sivakumar (1977).
42 *Ibid.*
43 *Ibid.*
44 The linkage between the widespread illicit arrack distilling and the class-jati nexus in Southern Chengalpattu is a complex and detailed one. A brief report on this by one of the authors appeared in *Point of View*. (September 1977). A more detailed study of this is currently being conducted by one of the authors. Even in the eighteenth century, daily quota of arrack and toddy constituted a part of the customary rewards of the Parayar *adimais*. See, for instance, "Board of Revenue (Consultations) Proceedings", vol 157, pp 5242-5245.
45 This is an aspect of the linkage between class-jati nexus and illicit arrack distilling referred to in note 44 above.
46 See Beteille (1965).
47 This was narrated to us by Palli and Brahmin landowners belonging to several villages in this region.
48 Sivakumar (1977).
49 *Ibid.*
50 During 1916-1976, the population of landless peasants increased by 107 per cent while the population of the villages themselves increased by only 86 per cent. (Source: census conducted by Sivakumar and Genealogical Tables.)
51 See Sivakumar (1978a).
52 *Ibid.*
53 Recent happenings, such as the "massacre of Harijans by upper castes" at Villupuram, must be seen in this light. Interestingly enough, our informants tell us that,
(i) The men-behind-the-scene in both parties at Villupuram were rivals in the thriving trade in contraband from Pondichery. Thus, occupational rivalry.
(ii) The mistress of the 'Harijan' over whom the trouble was sparked, was a Palli.
(iii) Palli-Parayar disputes are most frequent in that area.
All this portrays a scene very similar to the one at asthapuram-Kanthapuram.
54 For instance, one of the friends at Asthapuram asked one of the authors in 1976: "Have you seen Indira Gandhi? You are from Delhi. So you must be seeing her everyday!". The author asked him whether it mattered that he [the author] saw Indira Gandhi. The reply was: "Is she not the *arasu* (government)?" The author asked: "Does that matter?" Pat came the reply, "The government is everything. As far as Gods are concerned, you can take a vow and make an offering and keep them happy. What can you give to a government? Even your life is not enough offering to it!"

Di… Caste and Class Conflicts

Sharad Patil

The transition from the non-hereditary varna to the hereditary jati marks the transition from the early tribal slave societies to the feudal societies before India was colonised. This article traces that process in some detail. Jati or caste did then represent class defined in terms of relation to land, expropriation of its surplus, and military and bureaucratic sharing of wealth and power.

With colonial society, new class relations came into being. In the basically mercantile economy the urban bourgeoisie, big and small, merged with the rural class of rentier landlords as the creditor became de facto landlord and the debtor a permanent serf. Naturally, the rentier was a vehement protagonist of the varna jati dharma or ideology, ever to underpin the changing economic and political base.

It should be emphasised that the ruling classes of capitalists and landlords and their parties increasingly rely on caste and religious support in the race for parliamentary power.

Given the composition of Indian society, socialism cannot be achieved without peasant agrarian revolution. And it is in the rural areas that caste is the strongest. Mass organisations will have to devote as much energy to the struggle against caste as they devote to the struggle against economic exploitation on new class lines.

CASTE in Vedic times was not based on birth, but on initiation (Aryan: *upanayana;* non-Aryan: *abhisincana, upasampada*). The *Vratya-stoma* of Atharva-veda (XV) was composed for absorbing alien tribes or tribesmen into the tribal caste society. As for hierarchical ranking of castes, we see that during the epic period, through the higher three castes: Brahman, Kshatriya and Vaisya, of the rajaka (monarchical) tribal slave States had hypergamous inequality amongst them, they had equal rights in the administrative organs of these States, i e, in the sabha (tribal council) and the parishad (tribal assembly). In the a-rajaka (non-monorchical) tribal slave States or sangha-ganas — from which Mahavira and Buddha hailed — there was no Brahmin caste at all, the custodian of purity. (The Sudra-Dasas, though slaves during the whole epoch of the tribal slave society, were varna and not non-varna, and hence were not untouchables.)

Two Heritages

Phule's theory of the caste system was that it was created by the Aryan or Irani Bhats or Brahmans. His harking back to king Bali[1] meant that, before the coming of the Irani Brahmins, Indian society was a casteless (i e, classless) agricultural community. Thus, his race theory did not owe its origin exclusively to the European one but drew upon an age-old non-Brahman tradition.[2] The term 'bahu-jana samaj', meaning majority of society, is not of Marathi origin. Indeed, 'bahu-jana' was a term which Buddha usually used to denote the masses, while 'Brahmanetara' is a term which goes back to early Vedic times.

"Aitareya Brahmana" (II.19), the earliest treatise on Vedic ritualism, relates that the Vedic seer Kavasha Ailusha was denounced as 'a-Brahmin' by the Aryan priests, who were performing a sacrificial session on the banks of the river Saravaati; he was driven out in to the sandy waste to die of thirst and hunger. His 'Child of the Waters' *(Apo-naptriyam)* hymn (Rg X.30) was meant for performing the magic of 'controlled inundation' (*parisaraka*) of the riparian land. This means that he belonged to the riparian agricultural civilisation of the Indus era. Rks 20-24 of the Rg-Vedic hymn III.53, composed by the Aryan seer Visvamitra, are considered to be anti-Vasishtha. The former was patriarchal while the latter was matriarchal. Hence the struggle that commenced at this early period of Indian history was between two peoples — the one agricultural and hence matriarchal and matrilineal and the other pastoral and hence patriarchal. Karma, in his quarrel with Salya, derided the matrilineal Vahikas of Punjab as Dasamiyas and Vrshalas (slaves and slavelike).[3]

The grammarian Patanjali (BC 200), commenting on Panini's rule I.4.1, classified the countries of his time as '*a-Brahmanako desah*' (non-Brahmin countries) and 'a-Vrshalak desah' (Brahmin countries).[4] The struggle between these two social systems was bound to be fought out in the ideological field. Philosophies of India are not divided between materialistic and idealistic systems, but between a-Brahmin or *Nastika* (anti-transcendentalistic) and Brahmin or *Astika* (transcendentalistic). Shankhya (Later tradition classified this as Brahmanic), Lokayata (materialism), Jainism and Buddhism are a-Brahmin, while Purva-Mimamsa, Vedanta, Nyaya (Logic) and Vaiseshika are Brahmin. All these non-Brahmanic philosophies had their own monastic orders called *gana* or *sangha* (tribe) which were casteless (i e, classless). It is well known that these were against caste system and *karmakanda*. When two Bhikkhus called Yamelu and Tekula, hailing from the Brahmin caste, urged Buddha to permit them to render his teachings in Sanskrit, he forbade them and laid down that his teachings should be propagated exclusively in the languages spoken by the people.[5] The saint Jnanesvwra, who is supposed to have laid the foundation of the Bhakti movement in Maharashtra, was boycotted by the Brahmin caste council (Brahma-sabha), and hence, was constrained to embrace the non-Brahmanic Nath sect. The saint Cakradhara of the Mahanubhavas was Jnaneswara's predecessor. He was tortured to death by Hemadri, the Brahmin minister of the Yadavas of Deogiri. The Bhagawat dharma itself is considered to be non-Brahmanic.[6] Thus, Phule (1827-1890) had behind him a long non-Brahmin tradition.

The Brahmin or Astika philosophies and their Vedic and neo-Vedic religions were fierce protagonists of caste society and sexual inequality. The philosophy fashioned by priest-kings such as Pravahana Jaivali, Asvapati Kaikyea, and Janaka, of the rajaka tribal slave States was Brahmavada or Monist idealism, while the philosophy of the a-rajaka tribal slave States or *Sangha-ganas*, which arose out of the dissolution of these theocratic monarchies, was a form of Sankhya or dualistic pluralism.

Krishna, the leader of the first *sangha-gana* in India, was faced with the task of preserving his nascent oli-

garchy [illegible] the raj in States such as Magadha and Salva. He struck a historic compromise with a section of these rajaka States led by the Pandavas. The philosophy which he fashioned to justify this alliance came to be known as Advaita Brahmavada, a combination of the philosophies of these two types of slave States. Better known as Vedanta, it found its greatest exponent in modern times in Tilak who wrote his famous *"Gita-rahasya"* to expound it. Since then it has become the official philosophy of the Indian bourgeoisie who had reached a 'historical compromise' with landlordism right from the time of Phule and which has continued even after Independence.

Dange inherited this Astika tradition from Tilak. Bani Deshpande Dange's son-in-law, states in his "The Universe of Vedanta" that the Vedanta philosophy of Badarayana is the greatest philosophy of India[7] and proclaims " the Vedanta philosophers established their supremacy over every school of philosophy virtually wiping them out of existence from the soil of India "[8] Deshpande even claims that, what Marx did in fashioning his dialectical materialism was just to rediscover the Vedanta philosophy![9] Dange, in his foreword to this book, extolls the philosophy as "astounding cognition of the world process, its laws and philosophy" by the 'vedavadins'[10] This is the heritage of Vedavadin nationalists and communists!

Nagative Intellectual Legacy

B R Ambedkar attempted to prove that the Sudras originally constituted the solar Kshatriya caste of the Vedic Aryan society, but that since the Brahmins refused to perform *upanayana* for them they were pushed down to the fourth caste.[11] The non-Brahmins regarded not only the so-called Vedic religion, but all Vedic and Sanskrit literature, culture, and philosophy, to be products of the intellectual villainy of the Brahmins against the Sudra-Atisudras.[12]

Ambedkar's argument, however, can hardly stand the test of history. *Sangha-ganas* right from that of the Yadavas of the Mahabharata times (BC 850) to those of Buddha's time (BC 600) had no Brahmin caste. Their initiation *samskara* consisted in taking a ceremonial bath *(abhisincana) in their mangala pokkaranis* (lotus ponds). This negative attitude goes back to the time when the Nastika philosophies started their struggle against the Atika philosophies.

Though Buddha took the same attitude, he evolved his philosophy after a thorough exploration of the Astika and Nastika philosophies of his time, and in response to the need for a philosophy that could provide ideological leadership to the anti-slavery feudal revolution of his time. (Chapters XIV 'Sangha-gana', XV 'Philosophies of the Slave Era', and XVI 'Feudal Revolution', of my book *"Dasa-Sudra Slavery"*, being published by Allied Publishers, expound these philosophies sociologically.) That is why his school proved to be the longest (BC 600 to AD 700) and produced the greatest galaxy of philosophers from Nagasena and Nagarjuna to Dignaga and Dharmakirti. Buddhism is responsible for the greatest revolution in all fields of Indian history. But, though Buddhism was against caste system, it left it untouched. With its eclipse the non-Brahmin current lost its spirit of independent philosophical quest. The social, cultural and philosophical revolts, since then, were essentially readjustment within the feudal system, and were thus unable to go out of the caste and philosophical framework of Brahmanism.

Non-Brahmin thinkers of the colonial period though they broke through the caste framework, were unable to rise above this negative legacy. Their negative attitude towards the so-called Brahmanic Indian history, philosophy, and culture could not but have adverse effects on their intellectual achievements. That is why the non-Brahmins failed to develop their own scholarship.[13]

Dialectical Relation of Caste and Class

Phule identified caste with class. He visualised the struggle of the *bahujana samaj* as a class struggle of the Sudras and Ati-Sudras against the Shetjis and Bhatjis. It is worth noting that, up to the advent of the British raj in India, the main class division of all class societies in India was constituted in a communal manner. The rajaka tribal slave States of the epic period were constituted by the three ruling and exploiting castes: Brahman, Kshatriya and Vaisya, while the ruled and exploited caste was Sudra (in non-Brahmanical States: Dasa-karmakara). The Arab feudal class too, that ruled over non-Islamic subject peoples, comprised the conqueror Arab tribes.[14] Pre-Turkish Indian feudal society was made up of the military castes and the Brahmin caste as the ruling and exploiting castes, on the one hand, and the Sudra and Ati-Sudra castes (merchants, peasants and labourers), on the other. This will be best illustrated by what M G Ranade said in 1898 about the social transformation being brought about by the British:

> ...The country is in a transition stage, passing from semi-feudal patriarchal conditions of existence into a more settled and commercial order of things, from the laws of custom to the rule of competition.... In all countries, property, whether in land or in goods, must gravitate towards the class which has more intelligence and greater foresight, and practises abstinence, and must slip from the hands of those who are ignorant, improvident, and hopeless to stand on their own resources. This is a law of Providence and can never be wisely or safely ignored by practical statesmen for any fancied or sentimental considerations. As long as the differences in the habits and education of the saving few, represented by the Bania and the Brahmin classes, and the spending many who count by millions among the military and the cultivating classes remains good, property will gravitate from the one class to the other, notwithstanding all prohibitory legislation....[15]

Ranade, as is well known, was a social reformer, a liberal nationalist and one of our earliest bourgeois economists. What he says amounts to this: the feudal ruling castes of Brahmins and Marathas were being replaced by the capitalistic Brahmin and Bania castes. Phule used the more popular terms: Shetjis and Bhatjis, instead of Banias and Brahmins. Class in pre-colonial India was not made up of economically, politically and socially homogeneous group of persons, but of one or a cluster of castes which were analogous politically and socially. Class itself was a communal category.

But does this mean that there was no economic differentiation within castes? Many among the highest castes: Brahmin and Kshatriya, lived in penury even in ancient times. Angirasa, the Brahmin seer of the Rgvedic hymn X.117, cursing his affluent caste-brothers, says,

> No, the gods have not created hunger as the only way to death,
> Deaths (of various types) also await the satiated man.
> The riches of the donor do not get exhausted,
> And the miser finds no one to pity him.[16]

"Aitareya Brahmana" (VII.15) says that the Brahmin Ajigarta Sanyavasi, hard-pressed by hunger and destitution, sold off his middle son Sunahsepa for hundred cows to the Ikshuaku prince Rohita for sacrificing him in his stead to the god Varuna. The epics Ramayana and Mahabharata narrate tales of pauper Brahmins who lived by the *unche* way, i e, by gleaning grain from harvested fields and foodgathering. The captains of Alexander have recorded that numerous Kshatriyas hired out their services. This was the situation as far as the tribal slave society was concerned.

In feudalism, the ruled and exploited Sudra peasant castes had economic differentiations. Irfan Habib gives us a class break-up of a Punjab village surveyed in 1697-87 for the assessment of *jiziya* (poll tax on non-Muslims).[17]

'Where the mind is without fear and the head is held high;

Where knowledge is free;

Where the world has not been broken up into fragments by narrow domestic walls;

Where words come out from the depth of truth;

Where tireless striving stretches its arms towards perfection;

Where the clear stream of reason has not lost its way into the dreary desert sand of dead habit;

Where the mind is led forward by thee into ever-widening thought and action—

Into that heaven of freedom, my Father, let my country awake.'

Rabindranath Tagore

No	[illegible] of Persons	[illegible] Per Capita Valued at Rs	Economic Class	Caste
I	13	2,500	Zamindars; Moneylenders and grain merchants	Dominant military caste Vaisya castes
II	85	Over 52	Rich peasants and ordinary peasants and craftsmen	Sudra peasant castes, and artisan castes.
III	137	below 52		
IV	22(?)	—	Absolutely indigent	Ati-Sudra castes and tribes

TABLE 2

Taluka	Total Population	Agricultural Labourers	Agricultural Labourers Per Cent
Akrani	22,517	270	1.17
Akkalkuwa	58,516	3,433	5.86
Nawapur	99,360	18,022	18.13
Nandurbar	1,46,413	31,651	25.61
Taloda	79,686	22,515	28.13
Shahada	1,34,552	44,805	33.5

In the Gatha Sapta-sati of the Satavahana king Hala (AD 50) *gamani* (village chief) falls in category I, *gahavais* (Sanskrit: *graha-pati*, meaning householder) in II, and *halikas* in III. That is why the great scholast Vacaspati Misra (AD 900) said that a dusty-footed *halika* is not capable of philosophical cognition.[18]

But does this mean that economic differentiation had taken place in all castes? Data lifted from the census of 1951 is tabulated in Table 2 to help arrive at an approximate estimate as to the extent to which class differentiation had taken place in the six Adivasi taluks of the district Dhule in Maharashtra.

Class differentiation had taken place to the extent that land alienation due to usury and capitalistic agriculture had developed. We can infer from this that, in pre-colonial India, no economic differentiation could take place in the Adivasi tribes and the Ati-Sudra castes. In pre-colonial India, there were claims of shares in the agricultural product. This is not to be confused with private property in the means of production. Thus, in pre-colonial class societies of India, though economic differentiation could take place between the ruling and the peasant castes, it could not split any of these castes into classes. Caste hindered further class formation. Hence, class struggle in such a society could take place only through caste organisations. Class struggle took the form of caste (and communal) struggles.

Property and Caste

This conclusion is bound to lead to the formulation which Omvedt makes:

> ... Prior to colonial rule, in almost all cases, land was not a commodity but, in the words of Eric Wolf, an 'attribute of the community' to which the peasant belonged claimed by a community, a class, or tribe or lineage as a whole. In India, though the British asked the question 'who owned the land?', it was in fact the wrong question: no one owned it, rather, certain groups, from cultivators and artisans in villages up to feudal overlords, had a claim to shares of the produce on the basis of their performance of functions for the society. But colonial rule most typically established land as a market commodity ... .[19]

Sale and purchase of land is attested in Buddha's time itself by the purchase of the site for the Jeta-vana Vihara at Sravasti by the *trader* Anathapindika from the prince Jera of the non-tribal feudal Kosala kingdom. More regular transactions — sanctioned and regulated by law in Mauryan times — are evidenced by the chapter III.65 of the *"Arthasastra"* entitled 'Sale of Vastu' — *vastu* meaning house, land, etc.

This was possible because — with the advent of non-tribal feudal States such as Kosala, Magadha, Avanti, etc — instead of the clan, the joint family became the primary and most important unit of Society. Communal property was displaced by joint family property. According to *"Arthasastra"* (III.61) family and property became divisible in every fifth generation. Kautalya lays down that land can be sold or mortgaged [illegible] village, only, say by a [illegible] grantee to another grantee only. The seller had to ask his clansmen then his neighbours, then his creditor. Though it is argued that Kautalya had legislated only for the sale of a house, it is clear that he laid down a procedure by giving the rules for selling a vastu like a house.

R S Sharma's observation should be taken in this context. "It is only from the Gupta period onwards that the law books lay down provisions regarding partition, sale, mortgage, adverse possession and lease of land."[21] Irfan Habib proves indisputably that, during the Moghul period, peasant families owned their respective lands and they could alienate their lands subject to above-mentioned provisions.[22] Colonial rule removed all these restrictions on the alienation of landed property and opened the way for the formation of classes in every caste. Marx noted this new economic development and wrote in *New York Times*, August 8, 1853: "Modern industry will dissolve the hereditary division of labour, upon which rest the Indian castes, those decisive impediments to Indian progress and Indian power."[23]

According to Marx, caste was a product of pre-industrial class society. Hence he expected it to disappear during the development of modern industry and the class struggles generated by it. Dange, writing in *Socialist*, November 25, 1922, identified caste with class: "The fight of the Non-Brahmin classes to raise themselves to the status of the Brahmins began when the Hindu society divided itself into various castes or classes."[24] Thus, according to him, the struggle of the non-Brahmins was exclusively for sanskritisation, for raising themselves to the erstwhile ruling caste or castes. He went on to say that the non-Brahmin movement was dominated by petty bourgeois elements who wanted a share in the spoils. However, he admitted that there were also sincere but confused elements who wanted to do away with all classes. But, castes, he declared, were of no consequence; for they would vanish in the class struggle to give way to two classes only: "Proletarians and God Capital)!"[25] In order to prove his old thesis, he writes in his work of more mature age:

> The rise of the three Varnas (Brahman, Kshatriya and Vaisya) takes place simultaneously with the rise of slavery, the Sudra Varna. Why? Because slavery arises out of the same momentum that brought forth the Varnas — the variety and rising productivity of labour, exchange and private property ....[26]

That is why Prabhakar Vaidya remarks that class theory or class struggle was taken by these early communists to be the panacea for solving every problem![37]

Varna and Jati

Romila Thapar makes a distinction between varna and jati and thinks that varna was the theory and ritual ranking of castes, while jati was the actual status and functioning of castes.

> ... the functional aspect of caste appears to have been jati and not varna. Varna appears to have represented the theory of structure, and may best be translated by the word 'group'. Jati relationships represent the actual way in which society functioned, and this word is better translated as 'caste'. Varna became what sociologists have called the 'ritual rank', whereas jati was the indication of the actual status. The dharma-sastras, therefore, when speaking of varna, were referring to the theory of caste, each varna representing the ritual ranking of castes, and not necessarily the actual socio-economical status. Every jati was given a ritual rank so that its order in the hierarchy could be easily assigned...[28]

The rise and development of varna and jati are held by Thapar to be contemporaneous. The word jati does not occur in Vedic literature except in *"Nirukta"* (XII.13)[29] and *"Katyayana Srauta Sutra"*.[30] It means that jati is post-Vedic institution. Then what is varna? The Rgvedic hymn, I.179.6, says that the Kshatra Lopamudra and the Brahma Agastya nourished both the varnas by uniting in sacred marriage. According to A K Coomaraswamy, the sacred marriage (*deva-vivaha*) was performed in order to imitate the sacred marriage of the Sky and the Earth (*Dyava-Prithvi*) in rainy season through which the world was reproduced.[31] The Kasika commentary on Panini's rule, VI.2.131, tells us that the terms *paksha* and *varga* were applied to the parties or constituents of a tribe. These terms also mean half or the moieties of a tribe, which takes us to the original meaning of varna. The moieties of a tribe: Kshatra and Brahma, united to reproduce the tribe and the world. Aitareya Brahmana (IV.27) describes the sacred marriage of the Rashtri or Kshatra Vak and the Brahma Brhaspati. Rashtri is the only word for kingship in "Nighantu" (II.22.1), the oldest Vedic glossary. Thus, Rashtri was the designation of the queen of a matriarchal tribe. Rashtra means the communal land of a tribe. Vak also is called Rashtridevi by Atharva-veda (IV.30). Devi means one who distributes rashtra land by lots (aksha). The water of the river Sarasvati which was brought to consecrate a king in the Raja-suya sacrifice is called rashtra-da (rashtra-giving) by "Vajasaneyi Samhita" (X.2-4). Sarasvati, a tributary of the Indus, conferred such a kingship on the person elected by the tribe for kingship.

Thus, the matriarchal agricultural tribe of the Indus civilisation was constituted by two varnas, denoting its two sexes. The tribe was classless, but women being the rulers and men the ruled, there was social inequality between them. Thus, varna arose in a classless tribal society; but the society being matriarchal, it was a product of sexual or social inequality as well as division of labour. With the advent of the pre-Aryan rajaka tribal slave society, comprising of Kshatriya, Brahmin, and Dasa-Kamakara varnas, varna became the manifestation of social and economic inequalities and further division of labour in class society.

The word jati is used in the sense of caste for the first time by "Vinayapitaka".[32] It enumerates Candala, Vena, Nesada, Rathakara, and Pukkusa, as low jatis, and Khattiya and Brahmin as high jatis. We come across the jatis mentioned by "Vinayapitaka" only in the non-tribal feudal monarchies such as Kosala, Magadha, etc, that had arisen in Buddha's time. Hence, jati is a product of feudal society representing the multiplying and increasing division of labour and social and economic inequalities in that society.

Varna and Jati

But what is the difference between the social inequalities represented by these two institutions, and what is their relation with each other? Nobody could become a member of tribal society — classless or class — without being initiated with its *samsakara*. It was a puberty rite which entitled one to all the rights and privileges of that society. It was the ritual of rebirth.

Hence, Kshatriya and Brahmin varnas of the non-Brahman rajaka slave States were twice borns (*dvija*), while their communal slaves and labourers of the Dasa-Karmakara varna were once-borns. In the same manner, Brahmin, Kshatriya, and Vaisya varnas on the Brahmanic rajaka slave States were twice-borns, while their communal slaves and labourers of the Sudra varna were once-borns. Again, each of the twice-born varnas had a different kind of initiation ritual. The *sangha-ganas* that succeeded both types of the rajaka States had only two varnas: Kshatriya and Dasa-Karmakara. Thus, the main thing that distinguished the varna system was the initiation ritual.

The *sangha-gana*, or the highest form of tribal slave system, was displaced by the *samanta* or the non-tribal feudal system. Hence, initiation, a pre-eminently tribal ritual, lost its efficacy. It became an empty ritual. A person was now born in his jati, which is the literal meaning of the term. Kane gives the characteristic features of jati as follows:

> In most of the works on the castes in India a few features are pointed out as the characteristics common to all castes and sub-castes. They are: (1) heredity, i e, in theory a man is assigned to a particular caste by birth in that caste; (2) endogamy and exogamy, i e, restriction as to marrying in the same caste and not marrying certain relations or other persons, though of the same caste; (3) restrictions as to food (i e, what food or water may be taken or not taken and from whom); (4) occupation (i e, members of most castes follow certain occupations and no others); (5) graduation of castes, some being at the top in the social scale and others being deemed to be so low that they are untouchable ... (6) The caste council with the chief having in meeting assembled among other matter. The power to regulate the conduct of its members, to impose the penalties of fines or excommunication for lapses..."[33]

In the Buddhist canons, the word 'jati' is still used in the sense of tribe. The Sakya tribe is repeatedly referred to as jati,[34] Jatis evolved out of disintegrated or subjugated tribal States or tribes. The real disintegrator or subjugator of the tribal States or tribes was the new feudal means or mode of production. Jatis became parts of a non-tribal feudal class society, but regulated their internal affairs subject to the powers vested in the feudal State functionaries on a tribal model, as is evident from the above-mentioned characteristics. ***They took their place in the new non-tribal feudal society in the framework of the old varna system according to the new division of labour in a hierarchical manner.*** This is how the new varna-jati system came into existence.

Religion: New and Old

The religion of this new society is defined by the Dharmasastras as consisting of Srauta (Vedic) and Smarta (based on Smritis). Srauta was the varna-asrama and sacrificial (karma-kanda) religion of the old rajaka (priest-kingly) tribal slave society, and Smarta is the varna-jati religion of the new non-tribal feudal society. This composite religious code was systematised by

The Economic Times is your Knowledge Capsule

For the past 17 years, the Economic Times has been the leader in the field of economic journalism. Today more businessmen, more industrialists, more technocrats and more intellectuals read the Economic Times than any other economic paper.

The Economic Times has a well organised Research Bureau and a pool of trained journalists. They collect, decipher and analyse the developments in the fields of agriculture, trade, commerce, industry, banking, finance, shipping, transport, exports etc. It is their co-ordinated work that makes the Economic Times so meaningful and useful to its readers.

THE ECONOMIC TIMES

India's largest circulated economic daily.

Simultaneously published from Bombay, Delhi and Calcutta.

individual Brahmin priestly ministers of the feudal kings. But, though the religion of the rajaka tribal slave society was varna-asrama and karma-kanda, there never was any individual law-giver of the tribal slave society as a whole. The repositories of tribal religion were the tribal elders.

Yudhishthira, after becoming the priest-king (dharma-raja) of all the Kurus, sought instruction in dharma (which then covered everything, law, religion, philosophy, etc) from Bhishma, a Kshatriya tribal elder of the Kurus. Buddha says in the "Mahaparinibbana-sutta" that the repositors of the age-old religion of the Vajjis are their tribal elders. The religion of the sangha-gana oligarchies was again varna-asrama, though in a modified form, but minus karma-kanda.

The religion of each tribal State was in its own spoken language. The religion of the feudal society was now exclusively in sanskrit, which had long ceased to be a language spoken by the people. With the beginning of the Christian era, even the the non-Brahmanical Jainas and Buddhas adopted Sanskrit as their literary language. Sanskrit became a prerogative of the top feudal class. Not only Sudras and Ati-Sudras, but women as a class not excluding queens could speak only in Prakrit.

Brahmins now became the sole repositories of Vedas and Vedandas. In pre-feudal times, initiation was never the monopoly of the Brahmin varna. In that society, even when kingship became hereditary, every new king had to obtain the sanction of the tribal elders and he was consecrated to kingship by the tribal assembly. Only a Kshatriya could become a king. But now any powerful leader of a military tribe-cum-caste could seize power. That is why the Puranas say that, with the Sudra Nandas, Kshatriyas had ceased to exist. This military tribe-cum-caste had to be initiated to the Kshatriya caste. The job was now done by the Brahmin priesthood. The Brahmin caste became the sole dispenser of sanskritisation. In return, prominent priestly Brahmins received brahma-deya land grants. These grantees became a part of the class of zamindars — the Moghul term for feudal lords, equivalent to Deshmukhs or Desais. That is why Ranade said that the military caste and the Brahmin caste were the rulers of the feudal society.

Army of Prayer

Patil or mugaddam, and desai-deshmukh or chaudhari, were usually of the dominant military caste. Kulakarni-deshpande or patwari, and sir-deshpande or ganugo, were invariably Brahmins or to a lesser extent Kayasthas. What was their charge on the revenue collected? Irfan Habib informs us:

> ...It appears that from Mirat ... that there was a five per cent charge on the revenue which was equally divided between the mugaddam and the desai (chaudhari) just as there was another charge, known as sad-doi, or 'two per cent', which was equally divided between the patwari and the ganugo (Ain I, p 2000).[35]

What was the share of the village priest in the 'surplus product' of the peasant in a village? We get the following information from South India.

> .. According to Benjamin Heyne, who studied the situation in South India in the first decade of the last century, the tax equalled 35 per cent of the crop, the remuneration for the administration and armed men (of the zamindar?) accounted for 12.5 per cent, for members of the clergy over 2.5 per cent, and for servants (not engaged in agriculture) and artisans 2.5 per cent. Thus, only about half of the total crop (in an average year) was retained by the working part of the rural population (ryots, pariahs, servants and artisans).[36]

As for the tax-free land allotted to Brahmins and Cazees, we get the following information from Gujarat given by James Forbes in 1856.

> ...Some particular fields, called pysita and vajeeso lands, are set apart in each village for public purposes ..., in most, the produce of these lands is appropriated to the maintenance of the Brahmins, the cazees, washermen, smith, barber, and the lame, blind and helpless, as also to the support of a few vertunnes, or armed men who are kept for the defence of the village.
>
> In the tax report of June 10, 1815, prepared by Forbes, we find a more accurate description of *pysita* as a land allotment provided 'for the maintenance of various descriptions of artificers in each village'. It was also allotted to members of the clergy, communal servants and administrative staff of the district. The total areas of these lands in the district are 36,563 bighas, of which only 5,190 bighas were owned by 'village artificees, such as carpenters, blacksmiths, potters, tailors, washermen, barbers, shoemakers and tanners'. An estimated 14,380, bighas were owned by communal servants (bhils, jains, etc), while the rest of this land (16,993 bighas) belonged to the administration personnel and priests staffing the temples and mosques. In other words, this part of the land was in effect feudal tax-exempt property. ...[37]

Religious land grants to Brahmins in the pre-Turkish feudal regimes in Maharashtra are described by R S Sharma as follows:

> In the Rastrakuta kingdom, far more villages were held by temples and Brahmanas than in the Pala and Pratihara dominions taken together. Apart from grants of villages made singly, the Rastrakuta records speak of the regrant of 400 villages by one ruler, and the grant by another ruler of 1,400 villages, 600 agraharas and 800 villages to temples (devakulas). Thus under the Rastrakutas, priestly institutions rather than priests themselves seem to have emerged as important intermediaries in land ... This development seems to have taken place in Maharashtra under the influence of the South where temples possessed more landed property than individual priests.[38]

Even under the bureaucratic feudalism of the imperial Mauryas rtvik (priest), acarya (teacher), mantri (minister) and purohita (royal chaplain) — all Brahmins — were paid a salary of 38,000 panas per year, equivalent to what was paid to senapati (army chief), yuvaraj (crown prince), rajmata (king's mother), and mahishi (chief queen) (V.91). The military caste and the Brahmin caste were equal partners in the feudal rule in every respect, the need being mutual. That is why the Moghul emperor Jahangir called the priesthood *'lashkar-i-dua'*.

> ...The State had its own interest in maintaining this class. Jahangir called it the 'Army of Prayer', and he is reported to have said that this army was as important for the empire as the real army....[39]

R S Sharma notes that, in India, there was no 'struggle between the Papacy and the State' (which later developed into the ideological struggle that prepared the ground for the industrial revolution) which characterised the history of medieval Europe, but that the ruling dynasties of pre-Turkish times 'vied with one another in making religious grants'.[40]

Sankaracharya (AD 788-820), considered to be the greatest idealist philosopher of India, established the organised Hindu church in India, which was the ideological and religious bulwark of Indian feudalism. The leaders of the Indian bourgeoisie did not unfurl the banner of materialism as their counterparts in Europe did a few centuries earlier, but took over the saffron flag of Vedanta from the Hindu church through Tilak. The only Marxist scholars of Indian philosophy of note: Rahul Sankrityayana, Deviprasad Chattopadhyaya, and K Damodaran — excepting the first — owe allegiance to the Vedantin Dange's political party. Damodaran could not withstand the spell of Vedanta.[41] Marxist philosophy is yet to wage a serious struggle against this philosophy of the Hindu church.

Struggle against Class-Caste

Omvedt says that, with colonial society, new class relations came into being.

> With the basically mercantile economy that dominated rural as well as urban colonial areas, the commercial bourgeoisie, big and little, was not simply an urban class but merged into the rural class of rentier landlords as the creditor became a *de facto* landlord and the debtor a permanent serf.[42]

The high caste Hindu rentier landlords were naturally vehement protagonists of the varna-jati dharma.[43] And though the political and economic base changed, the caste system survived.[44] With Independence,

> ... The Maharashtrian Brahmin intelligentsia, though still dominant in educational and cultural institutions, has been swept from political power by a rich peasant non-Brahmin elite with strong roots in the villages and with an institutional basis in rural co-operatives and educational societies. The existence of a class elite in almost every caste group, including untouchables, has meant a significant degree of opening up of the society and a dispersal of castes along the economic ladder. Yet caste traditions, including the relegation of untouchables to separate living areas, remain strong in the villages and religious practices which the Satyashodhak Samaj opposed, including reliance on Brahmin priests, remain in existence ...[45]

It should be added that the ruling classes of capitalists and landlords and their ruling party, as they turn away from 'Western' democracy, are increasingly relying on religious and caste support. (There was only Congress then. Now there is also Janata, the mass powerful and cohesive constituent of which is Jan Sangh.) Muslim and Christian communities in India are themselves caste ridden. Development of an elite class in every caste, community and tribe (increasing organised militancy in the tribal communities has forced the government to pour far greater funds for their 'uplift') has broadened and strengthened the social base of this class-cum-caste rule. The struggle for revolutionary social transformation in India has thus become more difficult, complex, and protracted. The warning that Ambedkar gave to Indian socialists and communists in 1936 has hardly lost its force today.

> ... That the social order prevalent in India is a matter which a Socialist must deal with, that unless he does so he cannot achieve his revolution, and that if he does achieve it as a result of good fortune he will have to grapple with it if he wishes to realise his ideal, is a proposition which in my opinion is incontrovertible. He will be compelled to take account of caste after revolution if he does not take account of it before revolution ...[46]

Socialism cannot be achieved in India without 'peasant (agrarian) revolution'. And it is in the rural areas that the caste system is the strongest and the Left movement the weakest — practically non-existent in large areas. As far as Maharashtra is concerned, Leftist parties have tended to become urbanised and elitised. Marxism is becoming increasingly attractive, but it is unable to bring Marxist persons, groups and parties closer in order to form a Marxist-Leninist party capable of organising and leading the revolution.

But there is increasing realisation, on the other hand, that an organised struggle against the caste system and oppression of women should accompany the class and mass movements. It is this realisation that has given rise to a controversy that in order to conduct such a struggle separate organisations of scheduled castes and tribes should be formed. Separate organisations of women of various Left parties are already in the field, though mainly led by elite urban women. There is no propriety in establishing new organisations of scheduled castes and tribes. Mass organisations of the agricultural labourers and industrial workers must devote as much energy to the struggle against the caste system as they devote to the struggle against the class system.

Will castes disappear along with classes? Marx said that, though economic classes will disappear in socialism, the old ideology, sexual inequality, inequality between intellectual and manual labour, disparity between urban and rural areas, and other vestiges of thousands of years of class rule will persist. The first castes arose out of the sexual or social inequality in the classless matriarchal society. Hence, caste being basically a manifestation of even pre-class social inequality, vestiges of caste will remain even after the disappearance of classes. Out of the fire of the final fight against these vestiges of caste-class system will emerge a new man, the builder of communism in India. All our energies, therefore, must be bent in conducting the present revolutionary movement against the class-caste rule with this final goal in view.

Caste and Class: An Interlinked View

Ajit Roy

In the face of growing attempts to substitute the concept of caste for that of class in the revolutionary strategy for India, this paper, unabashedly, seeks to uphold the essence of the traditional strategy of the historical communist movement in India.

First, contrary to the widespread view that the caste is a uniquely Indian phenomenon, the origin of varna *is shown as basically a form of class differentiation.*

Secondly, caste, with many significant variations no doubt, is traced in the social developments in other parts of the world.

Thirdly, the historical attempts made by Gandhi, Ambedkar and Lohia to solve the caste problem are briefly examined and their limitations revealed.

Next, the spontaneous movements within the caste-class dichotomy in India are briefly studied.

Finally, the class essence of the presently accentuated caste tensions is brought out.

CASTE, or more precisely, *varna*, for which the former, a Portuguese synonym, has come into wide use in comparatively recent years, has been an invariable dimension of the social evolution in India during the last 3,500 years. While the general connotation of the concept — as a hierarchical stratification of society — has remained unchanged, the specifics of the *varna* order have undergone a few changes, along with changes in the socio-economic environment.

Contrary to the naive view that the four-fold *varna* division, along with the accompanying residue of 'outcaste', was a readymade scheme of social order, of divine or semi-divine origin, and that it has been an inseparable component of the so-called Hindu *dharma*, most vedic scholars are in agreement that the concept of *varna* had undergone changes even in the vedic phase of history itself.

The earliest of the vedas, the Rigveda, uses the term *varna* to distinguish the Arya *varna* from the dasa *varna*. *Varna* means colour and "it was in this sense that the word seems to have been employed in contrasting the Arya and the dasa, referring to their fair and dark colours respectively."[1] During the Rigvedic phase itself, the Aryan community had started splitting into classes. The Rigveda frequently mentions three strata among the Aryans: Brahma, Kshatra and Vis, the first being the priestly literati, the second, the warriors and the last comprising the common people. "It is only in one of the later hymns, the celebrated Purushasukta, that a reference has been made to four orders of society as emanating from the sacrifice of the Primeval Being. The names of these four orders are given there as Brahmana, Rajanya, Vaisya and Sudra..."[2] Some scholars have, however, expressed doubt about the authenticity of this hymn's claim to Rigvedic origin; they believe it to be a later interpolation.

According to one opinion, "the emergence of a distinct class structure" among the Aryans coincided with the formation of the four *varnas* or what we have now come to identify as castes. "The earlier division into three social groups or *varnas* represented division of labour and division of social product and not division into classes. The first class-caste division occurred between the Aryans and the dasas who were major local enemies of the Aryans. New relations of production were introduced when the conquered dasas were transformed into a servile class and made the helots or servants of the tribe as a whole. The dasas who were absorbed into the Aryan fold as the shudra caste, became the main producers of the social surplus."[3]

It is true that that the first class division on the world scale was the division between master and slave, the latter procured from captives of alien tribes. It is also true that the pre-Aryan tribes absorbed into the Aryan fold as helots were turned into the base of the social pyramid and designated as the fourth, Shudra, *varna*. But the intra-Aryan division among the three original *varnas* was itself a class division, prior to the absorption of the pre-Aryans. The Vis or the Vaisya of the original three-fold *varna* division formed the pedestal of the Aryan society till the assimilation of the non-Aryan tribes in the form of the Shudras. "The Aitaraya Brahmana describes him [the Vaisya] as tributary to another" and "to be suppressed at will ."[4]

Indeed, the formation of the three original *varnas* signified the separation of the manual and mental labour. The Vis or the Vaisyas were condemned to manual labour in order to create and yield surplus produce for the maintenance of the two higher *varnas*.

The fact that the Kshatriya had been differentiated as a separate warrior stratum signified the advance of the process of dissolution of the primitive-communal system, in which wars — both defensive as well as offensive — were the common responsibility of all the able-bodied members of the clan. This separation representing the creation of a coercive force distinct from the collective as a whole signified a class division; the monopoly of the coercive powers in the hands of the upper stratum in turn contributed to a further consolidation of the division.

Division of labour simultaneously representing division of social product is nothing but a class division,

> because the *division of labour* implies the possibility, nay the fact that intellectual and material activity — enjoyment and labour, production and consumption — devolve on different individuals...
>
> With the division of labour, in which all these contradictions are implicit, which in its turn is based on the natural division in the family and the separation of society into individual families opposed to one another, is given simultaneously the *distribution*, and indeed the *unequal distribution*, both quantitative and qualitative, of labour and its products, hence property ..[5]

The differentiation between the Brahmana and the Kshatriya represented a division of mental and material labour within the ruling class, "so that within this class one part appears as the thinkers of the class (its active, conceptive ideologists, who make the perfecting of the illusion of the class about itself their chief source of livelihood), while the others' attitude to these ideas and illusions is more passive and receptive, because they are in reality the active members of this class and have less time to make up illusions and ideas about themselves. Within this class this cleavage can even develop

into a certain opposition and hostility between the two parts..."[6]

But on the whole it was, at least in the early phase, a functional division within the ruling class with opportunity of horizontal mobility. Vedic scholars cite many instances of such mobility in the early vedic phase. For example, one commentator says:

> Many members of the ruling families, finding court life unpleasant, due to succession disputes, intrigues and revolutions, adopted [the] lucrative and influential occupation of priesthood. Ikshaku Mandhatri's fourth and fifth descendants, Vishnu Vriddhas and Haritas, adopted priesthood... When Navaga's kingdom was destroyed, his fourth descendant, Rathithara became ... [a] priest. Haihaya Vitihavya being defeated by Pratardhana of Kasi became a ... priest. We owe the second Mandala of Rigveda to his son ... Kausika Gathina Visvaratha became a priest when his Kanyakubja kingdom was devastated by Haihaya inroads, and he assumed the name of Visvamitra and founded a priestly gotra of his own. The third Mandala of the Rigveda is mostly the composition of the Visvamitras... Bhargava Jamadagni (a Brahmana) became a warrior. His son, Parasu Ram, was a renowned fighter. Drona, an Angirasa (one of the four original Brahmana clans) was a teacher of the Pandavas in archery and he by his prowess acquired the South Panchala kingdom. Not only there were intermarriages between the Kshatriyas and Brahmanas, but professions were adopted and interchanged as circumstances demanded. The social organisation was in a fluidic condition.[7]

The two functions of the ruling class — physical coercion and intellectual coercion — were indeed collateral in nature. There are many instances in history when there two functions have been performed by one and the same stratum of the ruling class. For instance, in the opinion of Antonio Gramsci, "The Prussian *Junkers* resemble a priestly-military caste".[8]

Referring to the picture of the Aryan life as revealed in the Rigveda, Max Muller says:

> We see the Aryan tribes taking possession of the land and under the guidance of such warlike gods as Indra and Maruts, defending their new home against the assaults of the black-skinned aborigines as well as [illegible] inroads of later Aryan [illegible] but the period of war soon [illegible] end and when the great [illegible] people had once settled [illegible] their homesteads, the military and political duties seem to have been monopolised by what we call a *caste*, that is a small aristocracy.[9]

In a note on the word 'caste', Max Muller adds:

> During times of conquest and migration, such as represented to us in the hymns of the Rigveda, the system of castes, as it is described, for instance, in the Laws of Manu, would have been a simple impossibility... On the other hand, even during that early period, there must have been a division of labour, and hence we expect to find and do find in the gramas of the Five Nations, *warriors*, sometimes called nobles, leaders, kings, *counsellors*, sometimes called priests, prophets, judges; and *working men* whether ploughers or builders or roadmakers. These three divisions we find clearly even in the early hymns of the Rigveda.[10]

At a much later period, the *varna* division was further extended to include a fourth stratum — the Shudras. According to a source quoted earlier,

> Chudes, a mixed tribe of Austroloids and Negroides, and whose settlements extended from Baltic Esthonia through eastern slopes of Urals, western spars of the Altai up to the western parts of Siberia, on the banks of Yenissi and whose ancient sites show that they were skilled in metal-making, fruit-raising, irrigation-works and raising of swine, have been known as Shudras... They were employed not only for grazing the cattle, tilling the soil, doing domestic work of drudgery, but also skilled in crafts so that they might be useful to their masters.[11]

Besides the Chudes, even if one accepts the above theory, the Shudra *varna* must have over the centuries absorbed the impoverished Vaisyas, the mixed descents from early Aryans and the indigenous pre-Aryan tribes, and other elements of pre-Aryan indigenous population absorbed in the lowest rung of the Aryan society. The original social divisions, based on divisions of economic and political powers, buttressed by ethnic, particularly colour, differentiation over the centuries crystallised into rigid caste divisions.

The masses of the indigenous pre-Aryan population, particularly dark in complexion, who refused to be absorbed in the lowest rung of the Aryan order, or were refused absorption, after the Aryans had consolidated their four-fold *varna* divisions, gradually came to be regarded as 'untouchables', the outcastes or the fifth *varna*.

Even after it had established its decisive sway and had even given rise to a reaction against its rigidity, in the form of Buddhism/Jainism, *varna* division had not, however, become fully hereditary in all the Aryan settlements. In his dialogue with Assalayana, a Brahmana youth, came to argue with Gotama Buddha, against the latter's teachings on *varna divisions*, Gotama is reported to have said:

"Have you heard that in some of the adjacent districts there are only two castes — masters and slaves — and that [a member of] the master [caste] can become a [member of] the slave [caste] and vice versa?"

To this, Assalayana replied: "yes, sir, I have heard that..."[12]

The evidence of the Rigvedic texts indirectly proves the existence of a class division of the contemporary Aryan society although slavery or induction of pre-Aryan clans as helots in the service of the Aryans was yet to emerge as a significant phenomenon. Without a part of the society having been relieved from the responsibility for material production, those beautiful hymns would never have been composed. Max Muller pays a glowing tribute to "the ancient literature of India, the literature dominated by the Vedic and Buddhistic religions" and says:

> That literature opens to us a chapter in what has been called the Education of the Human Race, to which we can find no parallel anywhere else. Whoever cares for the historical growth of our language, that is, of our thoughts whoever cares for the first intelligible development of religion and mythology however cares for the first foundation of what we in later times call the sciences of astronomy, metronomy, grammar and etymology, whoever cares for the first intimations of philosophical thought, for the first attempt at regulating family life, village life, and state life [illegible]founded on religion, ceremonial, tradition and contract (*sama*[illegible]) must pay the same attention [illegible] literature of the Vedic period [illegible] the literature of Greece [illegible] Rome and Germany.[13]

As to how this [illegible] intellectual achievement of the Vedic Aryans had been possible, Max Muller suggests two factors by way of explanation, one psychological and the other geophysical. In India, he says, "we find the Aryan man, whom we know in his various characters, as Greek, Roman, German, Celt and Slav, *in an entirely new character*. Whereas in his migration northward, his active and political energies are called out and brought to their highest perfection, we find the other side of the human character, *the passive and meditative*, carried to its fullest growth in India".[14]

Further, "in the northern climates, where life is and always must be a struggle, and a hard struggle too ... the European climate with long cold winters, in many places also the difficulties of cultivating the soil... We work till we can work no longer, our highest ideal of life is a fighting life". By contrast, in the East, particularly India, life is, or at all events was, not very

vere struggle, where climate was mild, soil fertile, where vegetable food small quantities sufficed to keep body health and strength, where the mplest hut or cave in a forest was all e shelter required ... was it not, I , natural there, or if you like, was not *intended* there, that another side human nature should be developed - not the active, the combative and quisitive, but the passive, the medita- ve and reflective?"[15]

Max Muller certainly has a point ere. The mild climate and fertile soil id play a significant part in the evolu- on of the early Vedic society in India. hey combined to enable a *part* of the ociety to produce the basic needs of he whole community and thus free the *ther part* to indulge in passive medita- ion and reflection. Because of these wo distinctive features of the Vedic abitat, namely, fewer needs and lighter abour needed to meet them even on he basis of quite primitive technology, xtraction of surplus produce was ossible even before slavery in one or nother form had made its appearance n India.

The differences in geophysical en- vironments may have in course of a historical span contributed to a process of psychological differentiation between the northern and southern Aryans, but there could hardly have any major psychological divide between the two branches of the Aryans, so recently parted.

Moreover, the high level of medita- tion and reflection expressed in the Vedic literature was far from the uni- versal level of the Vedic society. It was the reverse side of the intellectual retardation of, originally, the Vaisya commoners, and then the shudra labour- ers who were condemned to a life of hard physical labour and subsequently debarred from access to superior knowledge.

Finally, as Max Muller himself men- tions, but without fully realising its significance, conscious attempts were made by the emerging power elite — the passive meditators — to perpetuate this iniquitous social division by "at- tempts at regulating family life, village life and state life, as founded on reli- gion, ceremonial, tradition and contract".

Thus the *varna* division from its original beginning in the Rigvedic phase was essentially a reflection of class differentiation, sustained by the ideological and political domination of the ruling strata.

Just as the ruling class was functio- nally, differentiated into collateral Kshatriyas and Brahmanas, similarly also with the growth of productive forces and consequent separation of handicrafts and agriculture, there came to develop functional differentiation among the practitioners of various crafts. In the course of time and under the conditions prevailing, transmission of hereditary skill played an important part in the maintenance and develop- ment of crafts and services. Therefore, the growth of sub-castes and their petrifaction into hereditary formations followed as a matter of course.

Over the centuries, as new crafts and skills developed and new elements from the aboriginal clans became absorbed within the wider social frame, dominat- ed by the Aryans, the number of sub- castes went on proliferating. And under the over-powering influence of the Brahmanical ideology of hierarchical social order, these sub-castes became embroiled in struggles for relative superiority *vis-a-vis* the other, originally collateral, sub-castes.

The practice of untouchability is a much later development and its origin is still somewhat a matter of specula- tion. Ghurye, for instance, offers the following explanation of the origin of this practice:

> Special rights for higher classes and disabilities on the lower ones was almost a universal feature of class-society; and the Brahmanic theory of four castes with their rights and disabilities does not call for any special explanation. Only the practice of untouchability is peculiar to the Hindu system. It will have been clear from the history of this factor of caste ... that the ideas of untouchability and unapproach- ability arose out of the ideas of ceremonial purity, first applied to the aboriginal Shudras in connection with the sacrificial ritual and ex- panded and extended to other groups because of the theoretical impurity of certain occupations.[16]

This explanation is far from satis- factory. First of all, untouchability is not so particularly an Indian pheno- menon. As Ghurye himself says else- where: "In Japan during her military age — twelfth century to the middle of the nineteenth century AD — society was divided into five distinct groups... The fifth class was formed by two groups called the Eta and Hinin, who were the Pariahs and outcastes of the community".[17]

Ancient Iran also had a four-fold social division and a very important place for the priests and rituals;[18] but this had not led to the practice of un- touchability and unapproachability. The explanation of the emergence of this obnoxious phenomenon probably lies mainly in the sharp ethnic difference between the fair-skinned Aryans who formed the ruling elite and the jet- black aborigines of this subcontinent. When the Aryans realised that a point has been reached in the process of absorption of the dark-skinned pre- Aryans at the base of the social pyramid, beyond which, they could not hope to retain even the already somewhat diluted purity of their race, they im- posed sharp, and strict restrictions on mutual contacts between the Aryan so- ciety and the pre-Aryan aborigines.

The Iranian branch of the Aryans had no such problems as they did not have to encounter a large mass of dark-skinned population. The theory of unclean jobs, willy-nilly performed by the fifth *varna*, would hardly explain the phenomenon of untouchability. In their primitive community, the Aryans themselves had to take care of the so- called 'unclean' jobs. They "had their own medicine men as [well as] their own carpenters who made the chariots, their own leather tanners who made leather for their war and domestic needs... [these jobs] required special training and technical knowledge. Every tribe had them and prized them".[19]

The importance of the pigmentation of the skin as a factor governing the accommodation of population groups within the caste system is proved by the fact that even after the *varna* order had been rigidly established, there was no difficulty for the established order in absorbing the fair-skinned fresh arrivals through the north-west at a relatively high rung of society.

From this brief and admittedly schematic sketch of the evolution of the *varna*/caste division of the Indian society, it should be clear that, Krsna's emphatic declaration in the *Bhagvad- geeta* ("The four-caste division has been created by Me") notwithstanding, the phenomenon is a product of historical evolution, conditioned by socio-econo- mic-ethnic factors. Not only that the *Bhagvadgeeta* is an *ex poste* rationalisa- tion of an existing social reality, but religion *in general* is so. Many enthu- siastic crusaders against the obnoxious caste system in India are unaware of this *real* interrelation between the Indian social evolution and the evolu- tion of the Hindu religion. Further, ignorant of the fact that Marx had built up his world outlook, at least chrono- logically speaking, by *first* revealing his basic truth — of the derivation of religion from the social reality — they accuse Marx of having 'failed Hindu

India'[20] by failing to make 'caste' the central key to the understanding of its problems. This accusation is entirely baseless as Marx had begun his social enquiry on his finding that:

> *Man makes religion*, religion does not make man... This state, this society, produce religion, an *inverted world consciousness*, because they are an *inverted world*. Religion is the general theory of that world, its encyclopaedic compendium, its logic in a popular form, its spiritualistic *point d'honneur*, its enthusiasm, its moral sanction, its solemn complement, its universal source of consolation, and justification...[21]

Hence, by providing an insight into the process of the stratification of the Indian society and the evolution of religion as its superstructure, Marx's writings help to understand and fight caste divisions.

II

Just as Indian *varna*/caste divisions have for their essence the class stratification of society, class differences elsewhere also under certain circumstances have assumed features of caste distinctions.

Not only had the ancient Egyptians and Iranians and the medieval Japanese evolved well-developed caste orders, only did the Prussian Junkers reveal many caste-like traits, many other social formations also have displayed features of castes: "castelike or quasi-caste systems have occurred in various societies whenever social strata have tended to evolve into closed, endogamous groups".[22]

Superficially viewed, the feudal division of medieval Europe closely resembled the three-fold stratification of the original Rigvedic *varnas*. "The nobility (counterpart of Kshatriya) was a military aristocracy charged with the defence of the country and the exercise of judicial power. The clergy (counterpart of Brahmana), an ecclesiastical and intellectual elite not only ministered to the spiritual needs of the population, but, as the literate stratum in the early medieval period, also performed important administrative functions. The peasantry's (the counterpart of the early Vaisya) principal social obligation was to labour for the support of the nobility and the clergy, who dominated the feudal oligarchy".[23]

Soon the two upper divisions developed into closed groups with identical interests as lords of huge landed estates and with close family connections. "After the twelfth century, entrance into the nobility could be obtained only through heredity or royal grace: henceforth the king alone could elevate a person of non-noble birth to the closed ranks of the nobility. During the height of the Middle Ages, kings made but sparing use of this power."[24] The "higher clerical offices were increasingly pre-empted by the younger sons of the noble families until the upper ranks of the church hierarchy became almost closed to any but those of noble blood".[25]

Just as the Indian *varna* division was later sought to be sanctified with the myth about the divine origin of the precise hierarchical order — that the Brahmana, Kshatriya Vaisya and Shudra were created out of the mouth, arm, thigh and feet respectively of Brahma, the Creater — so also was the medieval European hierarchy projected as a divine dispensation. R H Tawney quotes a medieval theologist: "The Church is divided in these three parts, preachers, and defenders, and...labourers ...As she is our mother, so she is a body, and health of this body stands in this, that one part of her answer to another, after the same measure that Jesus Christ has ordained it... Kindly man's hand helps his head, and his eye helps his foot, and his foot his dody... and thus should it be in parts of the Church... As diverse parts of man served unkindly to man if one took the service of another and left his own proper work, so diverse part of the Church have proper works to serve God..."[26]

All this, however, is not to deny the particularly petrified character that the caste system came to assume in India and the most obnoxious nature of the practice of untouchability with few historical parallels. While the roots of the practice of untouchability have already been touched upon, the petrifaction and the seeming unchangeability of the caste regime have to be traced in the very long period of historical stagnation of the Indian society. As Kosambi has rightly concluded:

> When the profound ignorance, generally complete illiteracy, of the UP Brahmins of the period (i e, late 19th century) is taken into account, this shows that the degenerate caste system had long outlived its usefulness to society — even at the very centre of Hindu sanctity, Banaras. However, due to historical inertia, the institution could be abolished only by fundamental alteration of the productive mechanism — industrialisation. Transient economic pressure could accomplish little.[27]

III

The explicitly religious reform movements and regional/local struggles apart, India has seen since the twenties three major streams of national campaigns for the eradication of caste iniquities in general and the curse of untouchability in particular, led by Ambedkar, Gandhi and Lohia, according to the chronological order of their initiation. Ambedkar started as the spokesman, of a particular sub-caste, Mahar, in the erstwhile Bombay province, but later emerged as the foremost leader of the 'untouchables' of the whole country. His lifelong struggles against the caste oppression were, however, constrained within the boundaries of constitutionalism on the one hand and religious reforms on the other. The limits of the first dimension were reached when as the chairman of the Constitution drafting committee, he successfully piloted in the Constitutional Assembly the republican Constitution of the Independent India — a Constitution which, true to the ideals of bourgeois democracy, proclaimed an end to all forms of *formal* inequalities among Indian citizens[28] (except for preferential treatment for the depressed sections of the population — a unique addition to the treasury of bourgeois democratic ideals) and further provided for legislation making the practice of untouchability a criminal and cognisable offence.

The other limiting dimension of his approach persuaded him to part way with Hinduism as a religion and to lead, shortly before his death in mid-1957, a mass conversion of the 'untouchables' to Buddhism at a ceremony in Nagpur in October 1956.

Although earlier Ambedkar had organised a Labour Party primarily with his caste followers and modelled on the British Labour Party, and, just prior to his death, he evinced a certain interest in establishing some sort of liaison with the Socialist Party led by Lohia, his entire outlook was firmly rooted in the Westminster type of democracy. Lohia's colleagues who acted as go-between in the negotiations with Ambedkar reported to Lohia: "He was very sympathetic, cordial and eager to understand our viewpoint in detail. He explained the democratic practice in England, at some length, of choosing a candidate, and it seems is a very great believer in democracy".[29] Lohia confirmed this aspect of Ambedkar's mental make-up when he wrote back: "With Dr Ambedkar, the greatest difficulty has always been his ideological affiliation with the Atlantic camp. I do not think that this affiliation is anything but ideological... You might continue a little ideological dis-

cussion with him through your common friends."

While Ambedkar's lifelong efforts including his part in the making of the Constitution have made some important contributions towards bettering the lot of the 'untouchables', they have been far from successful in liberating the latter. His religious excursion, leading him and his followers into the fold of Buddhism, has produced hardly better results. indeed in so far as the eradication of the inequality of the 'untouchables' is concerned, this has been as unproductive as the earlier conversions of the 'untouchables' to Christianity.

This was inevitable for two reasons: first, the superficial changes, represented by the legal-constitutional measures as well as the change of religion on the part of the oppressed *masses* had *no* structural changes in the bases of the social system as their counterpart; second and more important, as long as the wider Hindu society stuck to its traditional moorings, the overwhelming impact of its massive presence would successfully nullify the effects of any superficial and/or peripheral changes.

Gandhi's commitment to the eradication of untouchability was total. A firm believer in the Hindu religion and hence an ardent aspirant for *moksha*, from the twenties onward, he "declared, times without number, from various public platforms that it is the prayer of my heart that if I should fail to obtain *moksha* in this very birth, I might be born a *bhangi* in my next. ... if there is a rebirth in store for me, I wish to be born a *pariah* in the midst of pariahs, because thereby I would be able to render more effective service to them and also be in a better position to plead with other communities on their behalf".[31]

But as in other social spheres, Gandhi sought to achieve his objective in the sphere of caste relations also without destroying, even seriously disturbing, the existing order. He sought to tackle his task through an idealised and utopian interpretation of the *varna* division. This should be clear from the following exposition of his views given in 1932:

> The varna system is ethical as well as economic. It recognises the influence of previous lives and of heredity. All are not born with equal powers and similar tendencies. Neither the parents nor the State can measure the intelligence. But there would be no difficulty if each child is prepared for the profession indicated by heredity, environment and the influence of former lives; no time would be lost in fruitless experimentation, there would be no soul-killing competition, a spirit of contentment would pervade society and there would be no struggle for existence.[32]

However, to do justice to Gandhi, it should be mentioned that his advocacy of the *continuation of the varna* divisions was based on the utopian expection that all work would be regarded in equal esteem and would be equally rewarded.

Gandhi's approach was one of accommodation, instead of challenge. This will be clear from the practice he introduced in the Satyagraha Ashram, about which he writes:

> The Ashram does not believe in subcastes. There are no restrictions on interdining and all Ashramites sit to dinner in the same line. But no propaganda in favour of interdining is carried on outside the Ashram, as it is unnecessary for the removal of untouchability, which implies the lifting of bans imposed on Harijans in public institutions and discarding the superstition that a man is polluted by the touch of certain persons by reason of their birth in a particular caste. This disability can also be removed by legislation. Interdining and intermarriage are reforms of a different type which cannot be promoted by legislation or social pressure. The Ashramites therefore feel free to take permitted food with everyone else but do not carry on any such propaganda.[33]

It will be be seen from the above that like Ambedkar, Gandhi also depended substantially on legal-constitutional, that is, superstructural changes for achieving the desired reforms in social practice. In other words, he had no consciousness about the need for demolishing the social reality which had given rise to and continued to sustain the obnoxious practice of untouchability. This was the fundamental limitation of his 'Harijan' campaign ever since he had launched on it after his fast in the Yervada jail in 1932. His main weapon in combating this evil was his re-interpretation of the Hindu scriptures. He wrote in *Harijan*

> I have, indeed, said that the verses produced by the Sanatanists in support of untouchability as they describe it are wholly inconsistent with the fundamental principles of Hinduism. Therefore, under the canons of interpretation laid down in the Shastras themselves, such verses must be repudiated as devoid of authority.[34]

He made it clear repeatedly that *vis-a-vis* the question of untouchability, his aim was reforms within the framework of the Hindu religion. As he says:

> ...I have no doubt that, if Hindus cling to untouchability, Hinduism and Hindus will be swept out of existence. I cling to Hinduism because it gives me all the solace I need, and because I have found in it no warrant for untouchability as we know it today.[35]

Gandhi sought to avoid any confrontation of the 'untouchables' with their oppressors on either economic or social issues. For their economic amelioration, he would depend on welfare measures undertaken by reformists; at the social level he would depend on the enlightened caste Hindus for slowly persuading the conservative majority to eschew untouchability. To a correspondent who wanted to know if the Harijan labourers should be advised to retaliate against harassment by the landlords, Gandhi replied:

> No one can be compelled to slave for another. Hence, those Harijans who are oppressed should learn to quit the oppressors' lands. The question naturally arises: Where should they go after quitting these lands? It is the duty of a Harijan *sevak* to find some work or other for such helpless Harijans.[36]

To another question: "Rather than do constructive work among Harijans, will it not be better to create intense dissatisfaction amongst them with their condition and thus promote such self-help as they can generate among themselves? It is no use your trying to convert the *savarnas*", Gandhi replied:

> The question betrays ignorance of the whole scope of the movement. To create dissatifaction among the Harijans can bring no immetiate relief to them and can only perpetuate a vicious division amongst Hindus . the movement is one of repentance and reparation. Hence it is confined, on the one hand, to constructive work among Harijans, and, on the other, to conversion of *savarnas* by persuasion, arguments and, above all, by correct conduct on the part of the reformers.[37]

Gandhi was, it will be seen from the above, against any militant activism on the part of the Harijans.

Religious reform movements, of course, have played and can play significant roles in bringing about historical progress under certain conditions. But they can do so only if they reflect the urges and efforts, even if indirectly, for effecting the needed structural changes in society. Since Gandhi left the entire question of structural changes out of his terms of reference, his ceaseless campaigns on behalf of the 'untouchables' for a quarter of century were hardly more effective than, say, the efforts of missionaries to eradicate the evils of alcoholism or prostitution.

That the 'Harijan' work was the least successful among Gandhi's multifarious undertakings is proved by the fact that none of the 113 contributions from the

world and Indian statesmen and thinkers to a volume[38] brought out in his honour — a tome of 459 pages — makes any mention of this part of his activities; only the editor of the volume, S Radhakrishnan, devotes half a dozen lines to this in his editorial introduction.

Although he felt a measure of spiritual affinity with Gandhi, particularly on the question of "non-violent, peaceful means of propaganda, organisation and struggles", and later on developed a lot of respect for Ambedkar, Lohia advanced the struggle against untouchability considerably beyond the limits imposed by the two earlier exponents of the struggle against this practice. As against Gandhi's advice to the 'untouchables' to eschew active resistance against caste oppressions and his efforts to solve the problem within the framework of *varna* divisions, Lohia advocated militant struggles by the 'untouchables' themselves, though, rightly, in alliance with elements from the upper castes, for the total abolition of the caste system. While Ambedkar's activities were mainly limited to the 'untouchables' themselves — in Lohia's words, he (Ambedkar) "refused to become a leader of non-Harijans" — Lohia's conception of struggle envisaged a common front against the caste institutions embracing forward-looking elements from all parts of society.

If the collection of his articles, speeches and notes, published under the title "The Caste System" in 1964 is any guide, then it may be concluded that before 1953, Lohia had not paid any particular attention to this problem. In the ten years between 1953 and 1963, he seems to have developed a comprehensive approach to this question.

Though he claims that "the Socialist Party [that is, after he had split away from the PSP to form a separate party of which he was the undisputed leader] is the first political party in India which has understood the caste system ...",[39] his exposition of the problem was extrem[illegible]ppy and superficial. His [illegible] the subject, referred to [illegible] not even try to look into [illegible] social and historical origin of the [illegible] or its evolution overtime. His passionate zeal and crusading spirit notwithstanding, Lohia's outpourings on the [illegible]ject of caste are marked by sim[illegible] exposition, if not self-contradictions, as may be seen from the following analysis of his writings and speeches on the subject.

Lohia gives a correct estimate of the traditional strength of the caste [illegible] the objective reasons for it. He says:

> Caste is presumably world's largest insurance for which one does not pay a formal or regular premium. The solidarity is always there, when everything else fails. In fact, there are few occasions for other things being tried out. Men just tend to make friends within the caste, their family most certainly. Such a close solidarity at child-bearing, funeral obsequies, weddings and other rituals must necessarily have its consequences on other aspects of life including the political. It must, in fact, influence and determine the mind and its basic thought. The political aspects are easily influenced. When a continual get-together takes place on all major and personal events of life, it must be somewhat bizarre if political events took place outside that framework. When men are puzzled at a caste voting more or less alike, they behave as though they had come from another planet.[40]

Even if one makes allowance for the fact that with the progress of urbanisation and modernisation and the advance of intra-caste class differentiation and inter-caste class solidarity, there have been some modifications, the picture drawn above is still largely true in so far as the backward and less dynamic rural areas of the country are concerned.

He reveals correctly how different lower castes have successfully challenged Brahmin supremacy in various regions only to claim the same privileges for themselves *vis-a-vis* the other oppressed castes. "Again and again," he says, "the revolt of the down-graded castes has been misused to upgrade one or another caste rather than to destroy the entire edifice of castes".[41]

He repeatedly — and rightly — stresses that only a miniscule section of the high caste population form the ruling elite because of their economic power, professional excellence and intellectual accomplishments. The rest of the so-called high caste population are duped into supporting this elite out of a false consciousness of caste affinity.[42]

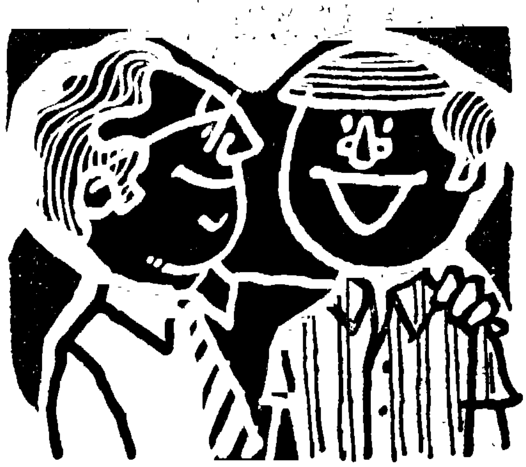
Alongside this analysis, Lohia formulates the following programme for destroying the caste institution:

(i) "Studies, debates, seminars and all other types of meetings and discussions [to] lay bare such elements of India's culture, thought and life, as have produced stagnation and caste";

(ii) actions "to purify religion and its practices of the taints of caste, which shall, while believing that intermarriage alone ultimately dissolves castes and propagating for it through scientific studies and the creative arts, concentrate on the immediately attainable aims of common and festival meals";

(iii) "demand the securing of sixty per cent of the leadership posts in government, political parties, business and armed services, by law or by convention, to the backward castes and groups .. taking care to see that one or two numerically powerful backward groups do not usurp the right of the immensely more massive but splintered totality of the lower castes...";

(iv) not to "act electorally but may, through appropriate decision and if requisite strength is reached, affiliate with an existing political party of its choice or turn itself into one..."[43]



The above programme was drawn up by Lohia for the Association for Study and Destruction of Caste some time in 1960. In 'A Note on Caste', presented at the special conference of the Socialist Party at Gorakhpur in June 1963 — the note in which he claims that "The Socialist Party is the first political party in India, which has understood the caste system and has launched a policy of abolition of castes" — Lohia says:

> The attack on caste has till now been from one and a half sides — from the religious side and partly from social movements. Now simultaneously with the economic approach, the attack has to be launched from the side of marriage relationship also, may it be verbal only, so that the social attack may be perfect. Adult franchise and the principle of preferential opportuni[illegible] constitute the political approach, while increased wages, abolition of taxes on uneconomic holdings, distribution of land, etc, would be the economic measures for abolishing caste. Such an all-round attack alone would render the destruction of caste possible at last.[44]

First of all, a little reflection would reveal that Lohia's analysis of the caste situation does not fully tally with his programme for its abolition. If the caste has acted, as it really has, as a sort of social insurance, then the caste institution cannot be overthrown unless an alternative system has emerged to substitute it. An alternative framework to replace caste can only be, in so far as the oppressed masses are concerned, organisations on class lines and fraternal ties among them. But the role of such class organisations and of class struggles for throwing up these organisations is totally absent in Lohia's scheme for struggles against caste.

He correctly reveals the dynamics of the caste struggles seen so far; one low caste or sub-caste seeking its own advancement, not only in isolation from but also at the cost of other low or

lower castes. But he does not seem to realise that this is inevitable as long as the movement is motivated by caste consciousness. He obviously does not accept the Marxist position that of all the social forces, it is only the working class which is objectively and historically compelled to emancipate all other oppressed and exploited segments along with its own emancipation. He clings to the utopian hope that a struggle inspired and limited by caste consciousness can rise above its *raison d'etre* and seek the liberation of the other segments of the oppressed population, beyond the circle of its own caste.

While Lohia is aware of the fact that the actually ruling or dominant force in the Indian society is not high castes as such, but a very small fraction of it, yet he does not accept that it is class struggle and class struggle only that can dispel the false (caste) consciousness that ties the depressed masses of the high castes to their affluent 'brethren' within the common castes.

The specific programme suggested by Lohia cannot basically alter the social reality that has arisen in the course of 3,500 years of history. For instance, studies, seminars and symposia can contribute to altering the social reality only if they are related to revolutionary mass practice. Lohia's programme of struggle against caste is not interwoven with the class struggles of the working class and the toiling peasantry. In isolation from these struggles, studies and debates would be a sterile intellectual pastime, which within the existing socio-economic milieu can be indulged in only by the educated upper caste elements.

Inter-dining will be a symbolic act only without affecting the condition of actual social existence, and intermarriage, a rarity, as long as an economic and cultural gulf continues to divide the high and low castes. Inter-[illegible] between the high and low [illegible] cannot be the means, as Lohia [illegible], for achieving the dissolution [illegible]; it can only be the consummation of the process of the abolition of castes.

Lohia [illegible] 60 per cent of the [illegible] in government, busi- [illegible]vices, etc, for backward [illegible]oups. It is, to say the least, [illegible] unreal and utopian to expect that a major and decisive part of government and armed services leadership will be handed over within a class society to elements from the oppressed segments of the society. It may perhaps be conceivable in a highly developed country like the United Kingdom, wherein for historical reasons a large stratum of the working class has been won for collaboration with the economically and politically dominant class, so that the manning of formal leadership positions by elements from the working class will not jeopardise the *status quo*. But it is idle to expect such a development in a country like India, pregnant with explosive potentialities because of massive and growing deprivation of the vast majority of the population.

Indeed, by raising such a demand, Lohia has revealed the reformist character of his approach. He does not advocate a revolution — peaceful or otherwise — involving the overthrow and destruction of the existing order. He aims at its reform — conceivably major reform — but without endangering its foundation.

Lohia demands the same proportion of leadership posts in the political parties also for the backward castes and groups. Since he does not qualify or specify the parties, the implication is that all political parties, including the parties of the dominant social forces, are also covered by this demand. One fails to understand what leadership role can the elements from backward castes and groups play in the political parties, i e, political instruments, of the ruling classes/strata.

How and why should business which is run for private profit be persuaded and/or cajoled to recruit its leadership according to the Lohia formula? Due to competition among business establishments, the only criterion in their recruitment can and must be efficiency.

Finally, can a modern society be run by a leadership, 60 per cent of whose personnel would be chosen because of their backwardness? Or, maybe, what Lohia had in mind was advanced, i e, educated and skilled, elements from backward groups. If so, isn't there a real danger of these elements getting alienated from their own social base and absorbed as elements subservient to the vested interests within the existing structure?

Moreover, how can it be ensured that some particular castes, sub-castes or groups will not try to monopolise the benefits of Lohia's formula? Or, alternatively, how to draw up a formula which will do justice to and satisfy all the innumerable sub-castes and groups among the backward segment of the Indian population? Will not such a venture serve only to intensify and perpetuate the divisions and dissensions among the backward sections, instead of unifying the masses of the oppressed and exploited population?

Lohia suggests that the movement for the abolition of castes may in future opt for an existing political party or form a new one. But nowhere does he elaborate the nature of politics, appropriate for the basic objectives of the movement. Politics implies a comprehensive perspective of social development, not merely the pursuit of a single or partial objective.

Moreover, if the last excerpt from Lohia's writing, quoted earlier, is supposed to represent his ideas about the political frame of the movement visualised by him, then Lohia's politics is hardly distinguishable from, say, Indira Gandhi's. For, adult franchise and preferential opportunities have already been there for some time, taxes on uneconomic holdings were abolished by many a state government under Congress rule, distribution of land and some increases in wages have also been promised and partially implemented.

It will thus be seen that in conceptual terms, Lohia's programme was basically a moderate one, which did not challenge the class rule of a minority, monopolising the productive resources of the society. It is a progra[illegible] for bargaining for impro[illegible]hin the existing system. [illegible]ce [illegible]rent differences notwithsta[illegible], Lohia's programme is not a radical alternative to Ambedkar's and Gandhi's approaches, but merely a development thereof.

The basic homogeneity of all these strands is rooted in their non-historical and anti-Marxist approach. Moreover, Anti-Marxism is more explicit in Lohia's case than in the case of the other two.

Before we come to anti-Marxism, let us take a particular sample of Lohia's non-historicism.

The resolution "Towards destruction of caste", drafted by Lohia begins as follows:

> The Third National [illegible]ference of the Socialist Party [illegible] the caste system in India as the largest single cause of the present material and spiritual *degeneration* of the country.[45]

Lohia's talk of degeneration is historically untrue. Compared to any previous period of the Indian history, the present period represents considerable advancement in both material and spiritual terms, all the growth of crisis factors notwithstanding. Indeed, even the present accentuation of the caste tensions represents an advance of self-awareness — a relative growth of the critical self-consciousness — and an

upsurge of [illegible] on the part of the most downtrodden segments of the Indian masses. Instead of degeneration from any idealised, hypothetical milieu in the past, all social symptoms indicate powerful struggles for regeneration and upliftment, struggles which have been fed in varying measures by many streams, including those represented by Ambedkar, Gandhi and Lohia.

In proclaiming the superiority of his own recipe over Marxism, Lohia says:

> Karl Marx tried to destroy class, without being aware of its amazing capacity to change itself into caste, not necessarily the ironbound caste of India but immobile class any way.[46]

One is not fully clear about the real import of the above statement. If it is meant only to convey the idea that all social distinctions have not been entirely removed in the historically evolved socialist societies, Lohia can hardly claim greater prescience than Marx. For, more than a century ago, in his famous "Critique of the Gotha Programme", Marx not only foretold, but justified this. These "defects", he said, "are inevitable in the first phase of communist society as it is when it has just emerged after prolonged birth pangs from capitalist society".

It is only "In a higher phase of communist society, after the enslaving subordination of the individual to the division of labour, and therewith also the antithesis between mental and physical labour, has vanished; after labour has become not only a means of life but life's prime want; after the productive forces have also increased with the all-round development of the individual, and all the springs of co-operative wealth flow more abundantly",[47] — only then, existing social distinctions can fully disappear.

Moreover, Lohia is wrong in supposing that any class or caste, including the so-called ironclad caste in India can really be immobile. Humanity is moving ahead towards the ultimate abolition of class and caste distinction, however devious the road it may have to traverse, in all societies, including, as we shall see below, the Indian.

On a number of occasions, Lohia brackets the Indian communist movement with the Congress and Nehru as forces upholding the *status quo* in the sphere of the caste. But he provides the most irrefutable argument against his own contention when he says about the pre-split Communist Party:

> It has indeed achieved remarkable success in acquiring for itself the loyalty of the agricultural labourers, who are by and large the Harijan castes. This phenomenon of Harijan loyalty to the Communist Party prevails over all of South India.[48]

Flying in the face of his own finding, Lohia characterised the (pre-split) CPI in Andhra Pradesh as an instrument of the Kamma caste. He said: The Kammas of Andhra "have almost as an entire caste sought to revenge themselves on the Reddys [another dominant caste in Andhra Pradesh] through the instrument of the Communist Party".[49] In this, he was only repeating the opinion of the American author Selig Harrison.[50] How jaundiced this view is may be seen from the following comments by another American academic:

> Because many of the Communist leaders [in Andhra Pradesh] were Kammas, the party has often been considered a Kamma party. This analysis must be qualified, however. The Communist movement did not represent a continuation of the sentiments which first emerged in the caste hostel movement and continued in the Justice Party and self-respect movements. Its demand for greater participation of deprived groups were generalised beyond the specific experience of Kammas and non-Brahmins. With this demand it was able to mobilise persons from many castes, including many Brahmins among the founders of the party.... There were also several Reddis, including the brother and the brother-in-law of the then young Congress leader [present President of India] N Sanjiva Reddy. To these persons, youth and a desire for reform were more important than caste. The Kamma support given to the Communist Party does not represent a caste-wide solidarity which consciously opted for communism in order to oppose the Brahmin-dominated Congress. It was more an explosion into politics by a group of persons who were doing the same things at the same time, and the first generation of Kammas to be educated joined this trend.[51]

His passionate commitment to the cause of eradicating caste divisions notwithstanding, his anti-Marxism and anti-communism prevented Lohia from arriving at a correct understanding of the caste problem and the solution thereof.

IV

In discussing the caste situation in India today, it is possible for a superficial viewer to miss the wood for the trees. The barbarous atrocities on the 'Harijan' masses in certain pockets of the country and the recent re-emergence of caste alignments as important and sometimes even apparently determining factor in the institutional politics tend to suggest that the so-called 'ironbound' caste dimensions of Indian social situation have not only continued to remain as strong as ever, but even become stronger. The reality, however, is entirely different. The whole course of socio-economic and political developments, particularly since Independence, has considerably weakened the caste element in all its dimensions. While in a vast country that India is, there are naturally wide differences between one region and another, there is no doubt about the logic of the overall development. The following empirical data and analytical comments are intended to give only same broad indications of these developments.

An American sociologist writes about the changes on the caste front in a small town (population 3,886) in the Nellore district in Andhra Pradesh, which he calls by a pseudonym, Peddur:

> [The] character and organisation of caste in Peddur is undergoing many changes today. All the people can remember when Madiga and Mala [Harijan] children had to sit separately in school, if they were allowed to attend at all; when high caste children returning from school had to leave their clothes at the doors of their homes and bathe before entering; when low caste teachers were not allowed to touch high caste children and higher caste teachers would never touch lower caste children, even in discipline. Children now sit together in the schools, some low caste teachers are even asked to lead certain high caste children to school by the hand and few children of any caste would think of bathing before entering their homes after a day of study.
>
> Some years ago, low caste people were seldom called by their proper names, being summoned by a desultory word or a shortened form of their names instead. Today they are often called politely. Whereas they were once not permitted to appear well-dressed or to smoke in the presence of others, they now can often do so without the fear of a rebuke. They can now legally enter temples, handle the cloth they wish to buy before purchasing it in certain stores and sometimes hand the cloth they want made into garments to tailors without wetting it first.
>
> ... After the first two panchayat elections of the 1950s the Madiga member was not allowed to speak at meetings and was offered neither chair nor mat to sit on. Now he is permitted a chair and is sometimes asked to comment on issues which concern him and the people he represents.[52]
>
> At the other pole of the society,
>
> Not long ago, Brahmins, Razus, and Komtis [all 'twice-born' castes] would take purificatory baths and say mantras before taking a meal. Now, many of them would enter a hotel in a

PARAPEX from Incab

The world's most modern Power Cable

INCAB, in collaboration with BICC of U K, takes another giant step forward in cable technology in India with the introduction of their newest power cable—PARAPEX. Manufactured by the unique Tandem-Dual Extrusion Process, PARAPEX is the most modern and powerful XLPE (Cross-linked Polyethylene) power cable, designed for today's demanding electrical industry.

INCAB's innovative technological know how and uncompromising quality control at every stage, has made PARAPEX truly power-packed in every respect. Quality, strength and performance.

THE PARAPEX PLUS-POINTS

★ Higher transmission capacity ★ Higher overload capacity ★ Higher temperature rating ★ Superior mechanical strength ★ No drainage problems ★ Relatively low cost per installed KVA ★ Trouble-free service and longer life

PARAPEX carries more power with reliability

larger town and eat without hesitation though they cannot be sure who cooks for and serves them.[53]

Among the middle order castes also, the restrictions on social relations are breaking down.

> Twentyfive years ago, only the Reddis, Kammas and Balijas would eat together. Now the Gollas Gaondlas and Begamas will also eat and drink with these castes and all of them are beginning to attend the ceremonies that occur in the different castes.[54]

It would, however, be entirely wrong to suppose that caste is disappearing at Peddur. The "system of caste", the report underlines, "though it is undergoing many changes, is still of basic significance in the social organisation of Peddur."[55]

Various studies about the role of caste in the alignments of forces in different states reveal that apart from the dynamics of socio-economic developments, the imperatives of political contests in representative institutions based on universal adult suffrage were promoting a devaluation of caste exclusiveness. For instance, an observer of the Andhra Pradesh scene comments about the electoral contest in a particular constituency in 1962 that "It is a rivalry which is not based on intrinsic or historic sub-caste rivalry, but on differing political interests..."[56]

About the state level politics in Andhra Pradesh, the same author says:

> Since 1962 both the Congress factions have been led by Reddis.. Each man has mobilised factional support in most of the state's twenty districts, cutting across caste and regional lines for political interests. Since the 1967 election each group has recruited members from the important castes in the state. The ministry contains several Reddis, two Kammas, two members of other minor landed castes, one member of a lesser status agricultural caste, two Brahmins, one Muslim, one weaver, and two Scheduled Caste persons. The dissident group has almost exactly the same composition, for it has recruited the rival to each of these persons, usually one of the same caste group. Similarly the two wings of the Communist Party have mobilised persons from both dominant castes, both under the leadership of Reddis. As in the villages, so in the State, political conflict in Andhra Pradesh takes place within both the dominant castes which have assumed state leadership. And as one goes higher, the term "caste conflict' begins to lose its usual meaning.[57]

Almost the same process has been discerned in Bihar state politics by another social scientist who says:

> The fact that the upper castes contended among themselves for political power required that each contending caste group go beyond its own power and seek support from other caste groups. This necessarily widened the scope of political involvement and the caste groups which stood on the periphery of political universe were inducted into it.... At the time of their entry into politics, most of these caste groups functioned as appendages of the main contenders in the upper castes; leaders from the upper castes co-opted men from the lower castes to leadership positions. The latter were for a time satisfied with their role as political apprentices of the former but slowly they succeeded in building their own autonomous support structure and emerged as leaders in their own right. Thus a slow process of induction of the underprivileged caste groups has been in operation in Bihar. This process has, however, led to the emergence of the underprivileged caste groups as crucial forces to be reckoned with in any political calculation.[58]
>
> It is true [he continues], that the underprivileged caste groups have, more or less, succeeded in breaking through the social barriers and effecting an entry into the political realm thus overcoming many difficulties in their path of social mobility, but this is attributable, by and large, to the levelling effect of democratic politics and the compulsions that such politics creates in its wake....[59]

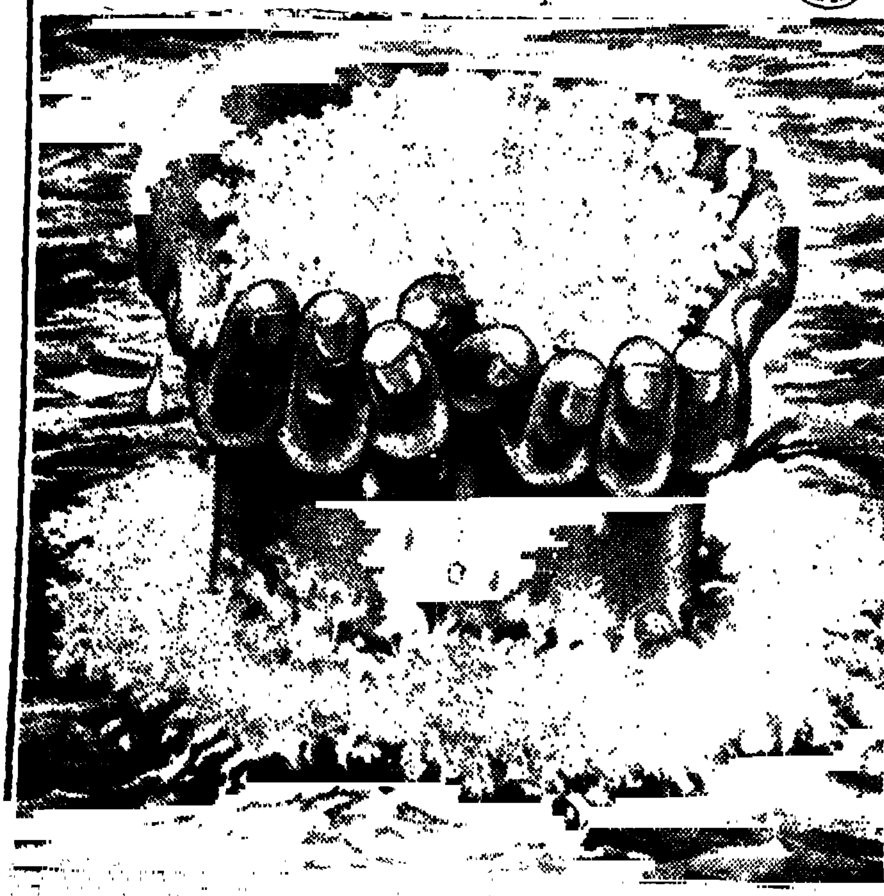
While the political process, analysed above, has led to a weakening of the caste-exclusiveness, it is still subject to caste determination. As Rajni Kothari rightly points out:

> The process of factionalism within the entrenched castes, a similar structuring of the ascendant castes, the system of co-optations and caste coalitions — all of these, though they brought about a fragmentation of the caste system, were in reality very much caste-oriented and sought their bases in caste identities, in the process of course, also generating politicised values and impulses for personal power.[60]

Kothari, however, fails to identify correctly the real source of 'politicised values', which he locates only in

> the impact of education, technology, changing status symbols, and urbanisation. New and more expanded networks of relationship come into being, new criteria of self-fulfilment are created, the craving for material benefits becomes all-pervasive and family and migration systems undergo drastic change. With these, the structure of particularistic loyalties gets overlaid by a more sophisticated system of social and political participation, with cross-cutting allegiances, a greater awareness of individual self-interest, and forms of involvement and alienation that are pre-eminently the products of modern education and the system of modern communication.[61]

With all his academic perspicacity, Kothari misses the essential and growingly powerful dissolvent of the antiquated social ties — the advancing process of class differentiation — the that castes are getting split into opposing classes and that elements from diverse castes are getting unified into confronting classes.



The volume, from which the above lines are quoted, itself gives some insight into this process of class differentiation. Relating to the developments within the Nadar community in Tamil Nadu, it is said:

> The very success of the Nadar community in its rise socially, economically and politically has eroded the unity of the community which had in fact made the uplift possible... The differences *within* the caste have become increasingly more significant than the differences between the individuals of different castes sharing similar social and economic backgrounds. The decline in the barriers of ritual purity have in the cities released the individual for the possibility of new interests and associations. The Nadar mill workers in Madurai are far more likely to vote communist along with the Thevar workers than they are to vote Congress despite the continuing charisma of Kamaraj... The increasing differentiation within the community and a concomitant decline in the elaboration of caste ranking has fundamentally affected the homogeneity of the caste community... they too provide the foundation for the emergence of a political culture characterised by the interests of economic class.[62]

To take another isolated and perhaps very much non-representative example today, in the village Thaiyur, 35 miles south of the Madras city, out of the 45 big farmer households, owning 9.75 acres or more each, 26 were 'Harijan' as against 19 non-'Harijan', while among the small farmer and landless labourer households, owning 0.00 to 1.49 acres each, there were 63 non-'Harijan' compared with 648 'Harijan'. The joint authors of the study conclude:

> The mainly Harijan rural proletariat continue to be exploited by the non-Harijan rich farmers, and we can predict that, as a result, the old caste ideology is likely to remain influential. But, in terms of absolute number, the class of big farmers consists of more Harijan households than non-Harijan ones. This implies that members of the same caste meet in relation of exploitation, and since this is at variance with caste ideology, we also expect changes in the ideological universe.[63]

Along with the economic stratification, social and cultural differentiations also are growing apace within the so-called scheduled caste communities. A study on the social background of the

Lok Sabha members shows that "The scheduled caste members with low levels of education were more in the third Lok Sabha and they were equally divided between high and low levels in the fourth Lok Sabha. In the fifth Lok Sabha, the highly, educated scheduled caste members formed a clear majority [among the scheduled caste members as a whole]".[64]

Since the educational level of the scheduled caste masses is significantly lower than the general educational level of the country, "The elite-mass gap in terms of levels of education was more among the scheduled castes than among general members". Between the third and the fifth Lok Sabhas, the representatives from business, industry and intellectual professions among the scheduled caste contingent registered a marked increase. The study also showed that the continuity in the membership of the Lok Sabha was higher among the scheduled caste MPs than among the other sections in the House.

The preferential opportunities offered to the scheduled castes since independence, however niggardly in terms of requirements for raising the vast masses of the historically deprived population, have nevertheless helped the emergence of a significant stratum of the scheduled caste elite. As a Bihar study shows, the differences between the privileged top of the scheduled castes and the basic masses thereof have become wide enough. It says:

> By and large, however, large numbers of the elite in both towns and villages have taken little interest in bettering the lot of their less fortunate brethren. They feel alienated from their own base and have betrayed an incapacity to apply themselves to the task of reshaping the larger society into egalitarian structures. Their major preoccupation is to satisfy the needs of their immediate family and kin.
>
> Some of the elite who have risen high in the social hierarchy have snapped their ties with their bleak past. They are largely out of tune with the mass of the community and seek a realignment with status and power groups in the wider society. This is more common with the public servants as social workers and legislators have to maintain a double face, one for the wider community with whom they interact in closest possible terms for furthering their own interest and the other for their own community whose support they have to seek at the time of the election.[65]

While the vast masses of the 'low caste' and 'outcaste' population continue to suffer in 'a twilight world of prejudice and persecution' under the double burden of economic and social deprivations,[66] one reinforcing the other, economic and social differentiations within these castes are progressively eroding the capacity of caste bonds to unify them into a militant force for resistance and social transformation. Besides, as stated earlier, the common denomination of the 'scheduled castes' conceals the multiplicity of sub-divisions encompassed within it, generally ranged against one another and often indulging in the same obnoxious practice of untouchability and discrimination among themselves as are practised against them collectively by the so-called high castes.

All this renders the choice of caste struggle, that is, choosing the concept of caste as the key instrument of revolutionary mobilisation totally unsuitable for bringing about such changes in the structure and superstructure of the Indian society as would lead to the emancipation of the most downtrodden and forcibly degraded masses of the so-called untouchables.

V

While the historically inherited prejudices still persist in shaping the psychology and conduct of the upper castes' relation with the 'untouchables', what has aggravated their aggressiveness in the recent years is the sharpening of the class contradictions in the countryside. The demand of the 'Harijans' for the implementation of the declared policy of giving preference to them in the distribution of land at the disposal of the states, their refusal to render *begar* (unpaid labour), and attempts to end the discriminatory lower wages, usually offered to 'Harijan' labourers, along with their growing assertion of human dignity and equality, have provoked the landowning classes, a great majority of whom belong to the higher castes, to launch on aggressive actions against the 'Harijans' on a mass scale.

The relatively recent growth of the kulak stratum and its emergence as a major political factor in certain parts of the country particularly following the Lok Sabha elections in March 1977 have contributed to an intensification of the kulak counter-offensive against the landless agricultural labourers and small peasants in the northern states. The fact that a majority of kulaks have sprung up from the intermediate landowning castes and the 'Harijan' small peasants and landless labourers have been chosen by them as the immediate target of attack because of the latter's vulnerability has lent this sharpening class struggle in the countryside an appearance of caste struggle. But revolutionary practice has to take cognisance of the essence of the phenomenon, instead of being guided by the appearance.

The above should not be construed to mean that class struggle *alone* can lead to the eradication of caste oppression. Caste discriminations have to be directly fought on their own grounds, but subordinated to the overall confrontation on the class lines. The point at issue is not the caste dimension of social struggles but its exact place and role in the overall revolutionary strategy.

Indeed, it should be the bounded duty and constant responsibility of the advanced elements among the toiling people in fields and factories, who belong to the so-called higher castes, to spearhead the attacks against caste prejudices and persecutions in social spheres; the advanced elements among the 'untouchables', while fighting against caste oppression and discrimination should generally emphasis among their community the class solidarity irrespective of castes. Out of this differentiated but co-ordinated attack only can emerge a real fighting front of struggle for human emancipation from both class and caste dimensions of oppression and exploitation.

A basic precondition of the emergence of this front is that advanced social thinkers and activists should learn to take a comprehensive and interlinked view of caste and class — a view that does not neglect the caste dimension of the class, or the class dimension of the caste. A lot of imprecise, unscientific and even confused thinking has emerged in this vital sector of contemporary politics which can seriously disorient the revolutionary practice, notwithstanding the honest and well-meaning intentions of the proponents of these views. It is therefore necessary that a wide discussion takes place among the exponents of the contending viewpoints as that a unity of will and action is forged for the resolution of the longstanding controversy within the Left in India.

Notes

1 G S Ghurye, "Caste and Classes in India", Popular Book Depot, Bombay, 1957, p 46., Many scholars cite this division between the Arya *varna* and Dasa *varna* as evidence of differentiation *within* the early Rigvedic, Aryan society. The above conclusion is unjustifiable. During the period under reference, according to many hymns of the Rigveda, the Dasa or Dasyu *varna* was regarded by the Aryans

as elements outside the pale of humanity, not to mention the Aryan social order. There are numerous invocations to Indra to kill and destroy the alien, despicable Dasas. Hence, these *varna* specifications refer to the division *between* the mutually exclusive and hostile Aryan and pre-Aryan populations, and not to any differentiation within the Aryan social order.

12 Ananda K Coomaraswamy and I B Horner, "The Living Thoughts of Gotama the Buddha", Cassell and Co, London, 1948, p 125, Kosambi gives a somewhat different version of the above dialogue and comments on the basis of internal evidence in his citation that "this passage could not have been written before Alexander's conquest of the Persian empire. The Buddha does not refer to the Rigvedic two-*varna* system, for the Arya could not become a Dasa. ", but he also agrees that "it sufficed to refute the theory that the four castes were in some way a law of nature". (D D Kosambi, "Introduction to the Study of Indian History", Popular Prakashan, Bombay, 1975, p 169.)

Kosambi, however, rejects the view that the Iranians also had a rudimentary caste system. The division, [illegible] into "four classes. the [illegible] charioteer, the tiller and [illegible] has nothing to do [illegible] endogamy is no-[illegible] ... all four classes seem [illegible] ..." (*op cit*, pp 108-41). It is difficult to accept Kosambi's view that even after the division of mental and manual labour, all classes were in reality equally honoured. If not, then, whatever the formal [illegible], the union between priest and tiller

families would be quite unusual.

Caste in Class Politics

Georges Kristoffel Lieten

Despite progressive intentions and legal provisions, fortified by the socialistic rhetoric of the ruling class parties, Indian political, social and economic life by and large has not become more egalitarian or less fragmented. As elsewhere in the world, there is no dearth of contradictions. A correct evaluation of the nature of these contradictions is of utmost importance in the assessment of the political issues the country is confronted with.

It is necessary to separate class contradictions from non-class contradictions, to separate real contradictions from false contradictions, and to reduce various kinds of contradictions to the basic one.

The problem is highly complex. It is related to the nature of the socio-economic formation, to the dialectic relationship between base and superstructure, to the historic role caste associations have played and to the political perspective the left political parties have written down in their programmes.

The former two aspects should theoretically reveal the extent to which caste has been transcended by class, both economically and socially. The latter two aspects should throw some light on how caste and class organisations relate to each other in practice.

INDIAN SOCIETY, spread out over a large sub-continent, has been fragmented throughout its history. Even during the so-called golden age of the Guptas, no political unity had come about. Social and economic unity were totally absent. Marx's condemnation of the idyllic village community which restrained the human being within the smallest possible compass and enslaved it under traditional rules of superstition and distinctions of caste[1] is echoed descriptively by A R Desai:

> the caste system socially disintegrated the Hindus into an ever increasing number of groups and sub-groups. The caste system was undemocratic and authoritarian in the extreme, each caste being considered inferior to those above it and superior to those below it. It prevents the growth of a nationality and the development of a democratic state.[2]

The British conquest brought more than half the Indian territory under a united political rule and introduced new economic activities. It thereby created a working class, a new middle class and a national bourgeoisie which lauched the nationalist movement leading up to the establishment of an independent, multinational Indian state, including the princely states but excluding Pakistan.

Thirty years after the establishment of that state one can rightly ask the question whether the fragmentation, separation and obscurantism of the past have been overcome and what has been the actual role of caste and class organisations. We know that the political leaders of the young Indian nation introduced constitutional clauses forbidding any form of caste or religious discrimination and declaring India a secular state The new India moreover introduced a system of progressive discrimination in favour of the depressed castes and tribal population,[3] and established a parliamentary system with universal franchise.

Despite the progressive intentions and legal provisions, fortified by the socialistic rhetoric of the ruling class parties, Indian political, social and economic life by and large has not become more egalitarian or less fragmented As elsewhere in the world there is no dearth of contradictions A correct evaluation of the nature of these contradictions is of utmost importance in the assessment of the political issues the country is confronted with It is necessary to separate class contradictions from non-class contradictions to separate real contradictions from false contradictions, and to reduce various kinds of contradictions to the basic one. Against this background we want to analyse caste struggle and class struggle.

Among the various groups within Indian society that are in opposition to one another, the following opposites can be classified.

- Hindu-Muslim
- Hindi - non-Hindi
- Sunni-Shia
- tribal-non-tribal
- caste-harijan
- male-female
- urban-rural
- agricultural-industrial
- employed-unemployed
- Worker-capitalist
- landless labourer-rich peasant
- sharecropper-landlord

At a first glance it is obvious that some of these contradictions reflect an unequal relationship between two groups which actually originates from the far more relevant, antagonistic contradictions existing within the two unequal groups. It is clear for example that although there exists an "urban bias in Indian planning" in fact the tendency of capital to concentrate in certain pockets and extract surplus from agriculture), the contradiction between monopoly capital and industrial labour within the urban centres is more serious, in fact antagonistic, than the differences existing between monopoly capital and the capitalist-landlord nexus. As a matter of fact in the Indian socio-economic formation the latter groups represent an uneasy marriage, disturbed by conflicts, crises and unequal participation in profits and gains but kept alive because of class interests separate from the classes below them.

It is also clear for example that most women do suffer from a triple handicap: the exploitation by moneylenders, landlords, black marketeers, corrupt bureaucrats, traders, small-scale capitalists, multinationals, etc, their often inferior position compared to men in public and private life, and the sole responsibility for householdwork. At the same time, however, it follows from the fact that since families are the units of production, consumption and reproduction, the more important contradiction, that between exploited and exploiting classes, is taken up jointly by grandparents, parents and children of male and female gender. As a consequence, without jointly fighting the bourgeois-landlord state, neither men nor women nor their children will be able to create conditions for the liberation of themselves and of others.[4]

In the recent past there has been an ongoing process initiated by Western academicians and development-aid organisations to give more importance to some of these contradictions — women, rural areas, slum dwellers — in order to deflect the Indian people from their

struggle against the real sources of their repression and exploitation.

A far more probable deflection to take place, however, is caused by another set of contradictions which are deeply rooted in Indian consciousness and, unlike the former, do not have apparent economic roots. The conflicts seem to function within the realm of ideas and cultural patterns. Closer investigation, however, reveals that behind the apparent religious, regional and linguistic differences, economic causes are the determining factor.

The Sunni-Shia conflict is a clear example of this type of contradiction. While the Shia Muslims, who do not believe in the first three caliph successors to the prophet Mohammed and venerate only the fourth successor, Hazrat Ali, were the feudal lords dominating social life in the Oudh region, their Sunni counterparts, who accept all four caliphs as true successors, were poor peasants and artisans. A combination of the gradual decline of the Shia nawabs during the recent decades and ascent of a considerable number of Sunnis in trade and business with the continuing miserable existence of the great bulk of Sunnis and ruinous developments for a section of Shias, gave rise to a conflict situation: the richer Sunnis, long-suffering under the cultural and political subjugation by Shias, and helped by their downtrodden co-religionists, now take recourse to a doctrinal dispute in order to assert their newly won status.[5]

It is clear that in the Shia-Sunni example, upper class sections within a community make use of fanatic crowds, adhering for their safety and survival to their religious symbols, in order to settle intra-class scores and in order to divert the poor masses from their own political struggle against the common enemy.

As it happens, equally between Muslims and Hindus, Nirankaris and Akalis, Maharashtrians and South Indians and between the different linguistic communities (Tamil-Hindi, Assamese - Bengali Gujarati - Marathi, Hindi-Urdu, etc) it can be easily demonstrated that vested interests are fanning the flames of religious, communal, *linguistic*, regional susceptibilities *for their own partisan ends* and that the major task the democratic movement in India is confronted with is to quiet down the tension, restore harmony on these issues and to concentrate *the* attention on the burning economic and political demands.

A far more serious theoretical and particularly political problem emerges around the issue of caste conflicts, *especially when the depressed castes are involved.*

Throughout the history of independent India innumerable concerted attacks by caste Hindus on the lower castes have been recorded. The structural continuity of the Indian system which is not upset by changes in party dominance is also observable in the treatment of low caste Hindus. The last two years, since Janata came to power, have not been particularly awful. On the contrary, if one takes the trouble of aggregating the incidents in any year that Indira Gandhi was in power, one has to come to the conclusion that the performance under Janata has been quite normal.

Recent caste incidents, however, thanks to the hightened democratic consciousness in India, have received major publicity. After the upper caste rampages in Belchi, Pupri, Dharmapura, Kanjhawala, Agra, Villupuram, Marathwada, Kaila, etc, the question has been posed again as to whether the Indian left has been paying enough attention to "caste war" whether they have done enough to organise and come to the defence of the depressed castes.[6]

The problem is highly complex. It is related to the nature of the socio-economic formation, to the dialectic relationship between base and superstructure, to the historic role caste associations have played and to the political perspective the left political parties have written down in their programmes.

The former two aspects should theoretically reveal the extent to which caste has been transcended by class, both economically and socially. The *latter two aspects should throw some* light on how caste and class organisations relate to each other in practice.

Modes of Production and Ideology

The concept of modes of production with their internal contradictions, the discovery of levels in society, the basis and the superstructure, and the necessity to turn the class struggle into a political movement for the overthrow of the state are three of Karl Marx's most significant contributions to social sciences.

Unfortunately, these complex notions have been too often represented in a simplified form.[7] Part of the problematic of the co-existence of and contradiction between two modes of production in India is currently the target of discussion among historians and economists.[8] One part of the problematic, the analytical nature of caste and class in the past and present, remains somewhat left out from the investigations. The questions as to what was the class function of caste in the ancient mode of production and as to what extent changes in the economic structure have resulted in the disappearance of caste as an ideological and social institution have only been dealt with in a very generalised way.

Social stratification in India from presumably ten to five centuries BC onwards has been codified ideologically in the varna system as a rationalisation of the relations of productions prevalent at that time. Its major strength of resistence against change lay in the fact that the real structural unit of the system was not the varnas but the innumerable localised and proliferating jatis. Within the local limit social mobility of the jati groups provided the system with an answer to new production techniques and new economic activities:

> Its flexibility made it possible for it to adjust itself to the two revolutions which in Europe created slavery out of the ashes of primitive communism and feudalism out of the ashes of slavery.[9]

The Indian socio-economic formation in pre-colonial times was, moreover, characterised by a number of features which distinguish it from European feudalism, usually clubbed around the concept of Asiatic Mode of Production[10]: autarchic village economies with an integrated system of agriculture and industry, communal relations of production in the sense that the individuals through caste and jajmani system had an inseparable link with the community and an inalienable right to a share in the produce of the land and of the village industry. Although there was no real private property in land, it was the small ruling section of the community which co-shared the land and had it cultivated, commonly or privately, by clients, tenants, agricultural labourers or slaves.

Jati as the structural unit of the varna system functioned within this socio-economic system. Its eulogising protagonists described it as the most harmonious example of idyllic village republics in which the different jatis were juxtaposed to each other. According to the famous description of Wiser in 1936, each in turn was master, each in turn was slave.[11] This idealisation persists in the functionalist approach of

Western and Western-dominated anthropologists. Perhaps the most blatant apology for the system can be found in the writings of Ishwaran: "Practically no resentment is generated by the social system against itself, because it provides a rationalisation for all its structural and most of its detailed aspects."[12] Although each caste plays a vital role in political life "for the services they perform are practically indispensable", in the utopian village the "wishes of the people do not like the same rights for all individuals".[13]

Even the widely appreciated Srinivas toes this line. He complains that since many are speaking up for classless and casteless society, "most of us ... are bamboozled into agreeing with something merely because we are afraid to be mistaken for being 'reactionary'".[14] According to his view "caste is so tacitly and so completely accepted by all including those who are most vocal in condemning it, that it is everywhere the unit of social action".[15]

Louis Dumont, going one step further, described the caste system as "a relation of mutual and assymetrical dependence".[16] His opinion, however, that the reciprocity "assures subsistence to each caste proportionally to his status",[17] brings him back to Wiser's position of caste harmony and caste bargaining.

This structuralist-functionalist approach merely tries to analyse the visible structure of appearances without any attempt to come to terms with the deeper social structure, fails to go beyond the assumption that "hierarchy is rooted in religion", and remains within the premise that the ideational pattern constructed by the ruling classes is the only possible term of reference for research. As long as the tendency persists of assuming that the caste ideology of Indian society in the past was the expression of social harmony devoutly led by a divine Brahmanical caste,[18] no progress can be made in the direction of a discovery of inequality between classes, of exploitation and oppression and in the direction of the need for a progressive, class based alternative.

The historical treatment by Namboodiripad in his study on Kerala remains, nothwithstanding its briefness, a useful tool to work with. The division of society into the intellectual (Bhrahmana), soldier (Kshatriya), businessman (Vaisya) and finally all manual workers who owed their labour to the previous three categories (Sudra) was *in essence* a class division: "unlike in Europe where primitive communism was replaced by a system which divided society into two classes — masters and slaves — the primitive communist society of India was replaced by a system which divided society into castes".[19]

The exact nature of the class categorisation in Indian society in the past has recently been analysed by Claude Meillassoux. He distinguishes sharply between class relation and patron-client relations, and calls the latter type of relationship "offshoots from the class relations" since the group of clients who specialised in specific activities, far from necessarily being exploited, on the contrary profited, through mediation of the patron who maintained them, from the exploitation of the labouring classes (slaves, serfs, agricultural workers, etc). The client relationship, as his schematic view clearly illustrates, was only a derived, secondary relationship whose functioning depended on the class relations that fed them.[20]

Unfortunately the patron-client relationship represented by the jajmani system has too often been confused with the totality of social relations in medieval India, as a consequence of which the class relations became even more concealed than they already were due to the peculiarities of the caste system. Despite the lack of much detailed research in this regard, one can safely assume that in the past a considerable percentage of the Indian population was drawn into neat class relations.[21]

In pre-capitalist modes of production, however, the economic classes did not come to full ideological and political articulation. In this type of society infrastructure and superstructure cannot be dissimilated into two separate structures: "kinship relations function as relations of production, political relations and as current ideologies. Here, kinship is therefore both infrastructure and superstructure".[22]

Kinship tribes which according to Marx were present in their most rigid form in the institution of caste,[23] functioned as elements of the relations of production and as the elements of the political, ideological and legal reflection of this material basis. This integrated structure made the institution of caste so deeprooted that it could maintain itself throughout the various pre-capitalist economic formations in India. The original tribal kinship society gave way successively to slavery, feudalism and even the emerging capitalist mode of production in which the tribal kinship groupings, proliferating into castes and sub-castes, acted as pillars in the changing relations of production. Considered as such, traditional Indian society combined relations of production characteristic of the ancient classless society with the modes of production of a class society.

With the introduction, however, of commodity production under the impact of the colonial capitalist economy, the kinship based modes of production came under severe stress. The forces of production had outgrown the pre-capitalist mode of production, and could develop further only outside this structure, as happened in Europe. Within emerging capitalism the forces of production took such huge strides that it took hardly one century for the European mercantile companies to conquer India, which had been till that time at least equally developed, economically and politically.

Changes introduced by the British colonial power, both at its infrastructural and at its superstructural level, penetrated deep into the Indian system. The various characteristics of caste were considered logically to be broken down swiftly by the revolutionary changes. The new land system, which made land a freely marketable commodity available for purchase by persons of any caste and which discarded the hereditary rights in the produce of the client castes as no longer economically rational; the steady de-industrialisation of household industry and the gradual increase of factory production in industrial areas; a modern transport network and expanded trade which interconnected locally isolated villages and castes; a new political system with British administrative, juridical and educational institutions; a new land revenue system leading to rising indebtedness and pauperisation; and other changes undermined the vocational basis of caste, its economic rationality its interactional restrictions and its spatial and political isolation.[24]

In his famous journalistic article "The Future of British Rule in India", Karl Marx understood the British mission in India as both destructive and regenerative. He observed that the East Indian Company had already broken up the self sufficient inertia of the villages by uprooting the native industry, but that while the work of regeneration had hardly begun the dissolution of society in stagnant, disconnected units had survived their vitality. Marx, however, anticipated this to happen, and to sound the death knell of the caste system: "Modern Industry, resulting from the railway

system, will dissolve the hereditary division of Indian labour, upon which rests the Indian castes, those decisive impediments to Indian progress and Indian power".[26]

The prediction did not come about in the short run and only partially in the long run because of three factors Marx did not take sufficiently into account in his journalistic propositions: the sharply decreased transforming potential of capitalism, the peculiar articulation of basis and superstructure, and the reactionary use made of obsolete ideologies and institutions by the ruling classes. The structure of class formation in modern India is related to the impact of these three factors.

TABLE: OCCUPATIONAL LEVELS BY CASTE

(Per Cent)

Occupational Levels	Caste						
	Harijans	Low Castes	Lower-Middle	Middle	Other High Castes	Rajputs	Brahmins
Agricultural and other unskilled labourers	42	23	10	9	2	7	2
Farm tenants, semi-skilled workers, washermen, barbers, shoemakers, potters, construction workers, etc	14	10	15	6	7	5	8
Small independent occupations — small farm-owners, small retailers, etc	33	43	43	49	25	52	34
Skilled occupations — policeman, drivers, mechanics, low status *white collar*, etc	8	9	15	19	9	20	17
Big land-holders, top level professional and managerial occupations, big business-men, etc	3	15	17	17	57	16	39
Total	100	100	100	100	100	100	100

STRUCTURAL RESTRAINTS ON CAPITALISM

The transforming potential of capitalism in the third world has turned out to be less than originally expected. Similar revolutionary developments as in Europe during the last three centuries would have led automatically to widespread industrialisation and to the concomitant remoulding of agriculture along capitalist lines. Experience has taught and recently more and more studies have come to the conclusion that the predicted development will be extremely tortuous, if it comes about at all, and that the only answer lies in the radical solution of the agrarian problem as a first step. Half a century ago, however during the period that the class party of the Indian working class was being formed, the theory of swift decolonisation, which implied the process of increasing industrialisation and the resulting solution of the agrarian problem by the mere pulling force of industrial capitalism, had taken hold of M N Roy and R P Dutt. Both had a foremost ideological influence on the early Communist Party of India. It followed from Dutt's premises that "if the future of India lies with large-scale industry, then the political future equally certainly lies with the industrial proletariat."[26]

Lenin's then already published study on imperialism, as the highest but moribund, decaying stage of capitalism implicitly questioned such a formational leap towards capitalist restructuring of the colonial world.

One of the reasons why capitalism in India could not transform the socio-economic formation more fundamentally has a clear bearing on the survival of caste practices as well. The revolution to be introduced by the colonial power, writes Namboodiripad, "had serious limitations in that it was carried out by a class which for its own survival as the ruling class in a foreign country had necessarily to seek political allies. Such allies they readily found in the representatives of those very classes and strata whose domination in society was to have been completely eliminated if the revolution was to be full and real."[27]

Other impediments created by the imperialist-feudalist combine are of course the drainage of potential capital accumulation, the strangling of small-scale industry and indegenous technology, the ruination of the home market, the immiseration and pauperisation of the great majority of the agricultural population, etc.

The phenomenon of class partnership between the most reactionary class of feudal (and capitalist) landlords and at the other extreme the monopoly bourgeoisie and imperialism, has continued *in independent India. Commodity* production and circulation have been introduced but pre-capitalist relations of production, the isolated position of villages and the extraction of surplus for mere consumptive purposes retain a structural dominance on agriculture.[28]

In this light one can see the evil practice of *caste oppression*, particularly untouchability and terrorisation of low castes and tribals, as the result of "the growth of feudal or semi-feudal landlordism and of the new rich on the same feudal, caste and social basis, and of their grip over the village economy and life".[29]

Nevertheless, despite this retarded development of capitalism and the integration of feudal and capitalist structures, caste barriers in economic life have been broken down and class differentiation within many jatis has developed sharply. While only a small percentage of people work in their own *caste profession*, members of many different castes are engaged in the same economic activity, whether it be in the agricultural, industrial, governmental or the so-called informal sector. This economic disintegration within the jati is not of recent origin, as is evidenced for example by the Census Reports around the turn of the century. Virtually all observers agree, moreover, that especially during the recent decades greater occupational mobility towards *caste-free professions* has taken place.[30]

In the early fifties Kathleen Gough observed the following, representative picture in a small village in Tanjore:

> Exactly half of Kumbapattai's adult Brahmins are now employed in town as government servants, school teachers or restaurant workers. Of the remainder some own up to 30 acres of land, others as little as three. One runs a grocery store and one a vegetarian restaurant. Among the non-Brahmins (most) have abandoned their traditional work. Today all the non-Brahmins except Potters, Village Temple Priests, Smiths, Washermen, and Barbers (who, in whole or in part, retain their traditional work) and the Koravas who are government

servants, are predominantly dependent on agriculture or horticulture. Irrespective of caste, however,[30] out of 56 men of these castes are now paddy traders, shop-keepers, or wage workers in a cigar factory in town. Among the 43 non-Brahmins who remain in agriculture, the mode of employment (owner-cultivator, contract labour, daily coolies, tenants) varies in a manner not determined by caste. The pallans have without exception remained in agricultural work.[31] The same class position is thus occupied by members of virtually all jatis. Anil Bhatt's data of caste-wide occupational level (see Table) show strikingly that caste status is not congruent with class status, although lower castes are naturally to be found mainly among the categories of agricultural labourers, unskilled labourers and tenants, and the higher caste groups are more concentrated in the occupational categories of landlords, entrepreneurs, professionals, etc. "Every caste, sub-caste and religious community contributed its own share (some more and some less) both to the bourgeois-landlord as well to the proletarian-semiproletarian peasant classes. Class society was thus emerging within the very framework of an essentially caste society."[32]

The role of caste has thus become a limiting rather than a determining factor. It remains limiting in the sense that it is very unusual to take up the traditional occupation of another caste, especially if it is ritually ranked lower, and in the sense that the entry into modern, caste-free occupations is predetermined as in all other class societies by the socio-economic status (wealth, education, connections, etc) of the individuals (not the jati) concerned. As everywhere else in the so-called free market economies, entrants into the so-called labour market are competitors; in economies with structural unemployment and ongoing immeseration, the competition within the class, stratified and divided by sectional interests, is bound to grow more vigorous. In India, therefore, certainly in the economically less expanding areas, a low class individual will be confronted with more serious resistance if he wants to take to land-ownership, teaching or entrepreneurship than if he decided to give up his traditional calling for coolie work. Similarly entrepreneurs are in a position to restrict employment opportunities for members of a specific group, for example their own caste or another caste, in exchange for political or pecuniary advantage.

The preceding picture indicates that although class position is not ascribed by caste and *individual* mobility along the class ladder in various occupational pursuits does occur as a rule, the restricted economic possibilities as a consequence of the stronghold of semi-feudal and imperialist elements on the economic structure help in confining the people within sectional, self-assuring ideological categories of the past. It is because of the enormous reserve army of unemployed people that the restrictive function of caste does not have a dysfunctional impact.[33]

Relative Autonomy of Superstructure

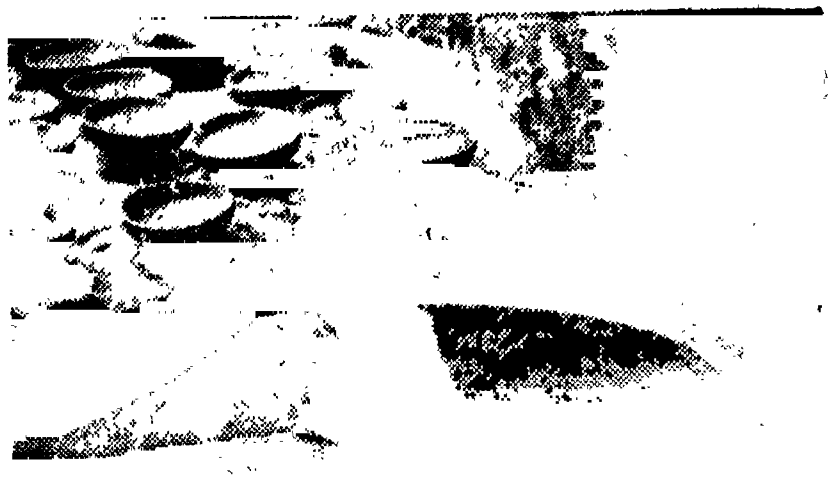
The second factor which has prevented a clear formation of classes of a capitalist society is the relative autonomy of the superstructure. In a previous section, it was pointed out that kinship systems, of which caste is a particular rigid example, are not actually ideological reflections thrown up in the superstructure but are the *units of the relations of production* themselves. This makes them extremely stubborn social institutions which, after their economic basis has been destroyed, may continue to persist in institutions and social consciousness.

In the analysis of classes and class consciousness one cannot but refer to the famous passage in the Preface to the "Critique of Political Economy", written in 1857: "In the social production of their life men enter into definite relations that are indispensable and independent of their will, relations of production that correspond to a definite stage of development of their material productive forces".[34]

The statement has often been interpreted as referring to unilateral economic determinism to the extent that classes are being determined at the economic level and reinforced at the superstructural level. This view arises out of an approach which substitutes "a one-sided, mechanical interpretation for Marx's complex dialectical model".[35]

The two founders of scientific socialism themselves were aware of this aberration. Since the social science discipline in those days was still almost exclusively of the idealistic variety, Marx and Engels in their half a century long argument with the idealist interpretation were bound to lay the main emphasis on the derivation of ideology and human behaviour from basic economic structures. Towards the end of his life in a letter to a German comrade, Engels wrote that this weakness had given adversaries

> a welcome opportunity for misunderstandings ... [It is not] that because we deny an independent historical development to the various ideological spheres which play a part in history we also deny them any *effect upon history*. The basis of this is the common undialectical conception of cause and effect as rigidly opposed poles, the total disregarding of interaction.[36]



In another letter, written some years earlier, he made the interconnection and non-homogeneity of the two structures even more explicit:

> According to the materialist conception of history, the *ultimate* determining element in history is the production and reproduction of real life. More than this neither Marx nor I have ever asserted. Hence if somebody twists this into saying that the economic element is the *only* determining one, he transforms that proposition into a meaningless, abstract, senseless phrase ... We make our history ourselves, but in the first place, under very definite assumptions and conditions. Among these the economic ones are ultimately decisive. But the political ones, etc, and indeed even the traditions which haunt human minds and also play a part, although not the decisive one.[37]

A "non-reductionist materialist analysis of politics",[38] asserting the relative autonomy of class struggle from economic class structure, provides us with a tool to explain the emergence of modern classes and the resilience of old stratification systems and values in traditional societies.

A "class in itself" (the economically constituted class) does not lead automatically to the class "for itself" (a self-conscious class). Although Marx has never rigorously defined the concepts of class for itself and class in itself, he has repeatedly stressed that the formation of classes depends to a considerable extent on class struggle: "The separate individuals form a class only in so far as they have to carry on a common battle against another class; otherwise they are on hostile terms with each other as competitors."[39] In other writings also the political preconditions for class formations were made abundantly clear.[40] In other words, the question of political organisation is crucial in the task of transcending the interests and consciousness of sectional groups towards class consciousness. The ideal type class, subsuming all individuals of the economic class is a distant ideal, but with organisational forms adequate to the socio-economic structure more and more sections can be drawn into the antagonistic classes, can be imbued with class consciousness and can even be transformed into a revolutionary class.

Two major consequences of this insight are, first, that political organisations shoulder important tasks in

the actual class formation or deformation, and, second, that class in a particular country is not an integral concept, various fractions can remain outside their own class until they are touched by class struggle and mobilised by their class organisation.

In the endeavour to construct "schematics of class relations" in his work "Terms of Trade and Class Relations" Ashok Mitra was confronted with the same dilemma, and came, presumably on the authority of Georg Lukacs, to the same conclusions. He asserts that notwithstanding the heterogeneities within the analytical categories with more or less similar economic interests, "elements from within the partly-formed mass — either on their own, or assisted by elements from outside — may nonetheless try to spark off a prior consciousness of interests for the yet-to-be-class. Provided such a consciousness is fostered at different levels, and on a sustained basis, the actual formation of the class may turn out to be a direct function of this endeavour itself".[41]

The resilience of caste in social and political life in many areas can therefore best be explained in the following terms caste practices continue because class practices have not yet become dominant at the political level.

Political movements in India are not only a reflection of the extent to which class has transcended caste but, at the operational level, have at the same time a major impact on caste or class polarisation and consciousness. This proposition actually leads us to the last but one argument in the light of which the programmatic understanding of the Left in India will be assessed: the role played by caste based movements in the struggle for independence, progress and democracy.

Caste-Based Movements

It has generally been argued that at least in the struggle for independence caste consciousness was weakened considerably, and that "the presence of foreign rule was a permanent stimulus to the Indian people to unite on a national basis".[42] Narrow caste, parochial, provincial and communal consciousness were reportedly undermined by the growth of the national movement. This claim cannot be rejected outright but should not be exaggerated either, as is usually the case in the glorification of the nationalist movement. Although this movement under the control of the emerging Indian national bourgeoisie had to take more and more resort to mass actions after the first world war, and although some of its finest leaders were secular throughout, most of the top leaders in the organisation and the second rank leaders were steeped in casteist and religious worldviews which had pernicious effects on the masses. Gandhi for example utilised (Hindu) religious traditions dear to the (Hindu) people in order to enhance their participation in the national movement. This approach, however, also enhanced the hold of religion and of religious, socially reactionary organisations.[43]

Indeed, political movements during the independence struggle were rather too often based on such unreliable grounds as religious fanaticism and sectarian anti-Brahmanism, that tragic consequences were bound to erupt.

Propaganda against British colonialism along Hindu as well as Muslim religious lines aroused tremendous hostilities which could and ultimately were diverted into a holocaust. It directly played into the hands of the colonial administration. Propaganda against the caste system by caste based movements on the other hand were often directly instigated or at least supported by the colonial power, basically as a weapon to break the united national movement Organisations which undertook to fight the caste system (Brahmo Samaj) or to reform it (Arya Samaj) as well as to oppose British colonialism were rather the exceptions.

By and large caste movements in the past have tended to oppose the main struggle of the people and collaborate with the main enemy in order to scope personal material advantages for the already advanced sections within the jati.

Hardgrave,[44] and in a similar way Rudolph and Rudolph,[45] have distinguished three types of political mobilisation along caste lines. While in the vertically integrated structure (parochial culture) the traditional ruling caste (or endogamous sub-caste) marshalled political support and economic subservience from the dependent client groups (lower castes or caste factions). in the integrated structures political cleavages were established between entire castes through direct ideological appeals against the vertical structures of traditional society. Caste movements at this stage of "integrated political culture" were often able to organise cohesion and solidarity within the caste grouping over a wide geographic area, and intensify the caste cleavages in the process. However, as Hardgrave argues:

> With upward mobility, the range of diversity within the caste increases and in so far as society begins to differentiate interactionally between various levels of the caste, elaboration in caste ranking will decline and caste solidarity will decrease. At the integrated stage, political solidarity is minimal, yet the very success of the community in fulfilling its aspirations accelerates internal differentiation and the formation of distinct class segments within the group.[46]

Thus, even within the functionalist-behaviouralist approach it is conceded that, as the traditional correspondence of caste status-class position is overtaken by the upward class mobility of a section of the ascriptive caste group, segments of caste communities start to distinguish interactionally between class segments of the caste and political support will get diffused: in the "differentiated political culture" class divisions assume increasing importance.

This behaviouralist pattern, of course, is not only influenced by the internal differentiation and degree of success, but also, and probably most decisively by the development of the basic movements of the Indian people: the nationalist movement, the democratic movement and the struggle of the working class and the peasantry. Leaders of the caste movements were able to mobilise vertical attachment as long as the basic movements remained weak or non-existent, as long as they did not become social forces drawing people into action and providing them with a new consciousness.

The objective fact, however, of depressed sections of the people fighting against the supposed causes of social oppression and economic misery pointed to a new kind of politics. Although national and class exploitation and repression remained concealed behind caste oppression, objectively the caste movement, even if fighting within the varna stratification, were not caste movements in the traditional sense any longer. They were simultaneously the expression of the class interests of a collaborating rich minority jockeying for a higher political and social status under the protective patronage of the colonial state power, and of the awakening discontent of the oppressed sections The natural social order as well as class organisation of the strata closest to the spoils of the colonial state were the endogamous caste groupings at the top of such widely ramified major castes as the Reddys, Nayars, Vokkaligas, Nadars, Vellalas, Jats, Ahirs, Kayasthas, Kurmis, etc. They provided the necessary ideological (casteist) and organisational leadership to the

endogamous lower class groupings of their own caste when it became necessary to involve these sections in action for the removal of social disabilities

Removal of the disabilities according to the Srinivas-ian upward mobility model in the form of sanskritisation was bound to fail in the case of low class-depressed caste category because of their economic dependence "their caste position allows the [upper caste] to command the ideological apparatus of the caste system"[47] Experience showed that this ideological apparatus was also used against the upper class-depressed caste category Even though the ritually defiled landlords and wealthy traders sanskritised their ways, they were frustrated in their attempts to win interactional recognition by the allied opposition of the high castes They had to turn from the "sacred" to the "secular", and create an instrument of the entire caste as an instrument of social and political mobilisation[48]

Examples of such fairly similar movements are the Satyashodhak Movement in Maharashtra, which recently was the subject of debate between B T Ranadive and Gail Omvedt[49] the caste associations in Kerala, and the non-Brahmin movement in Tamil Nadu

Evolution of Non Brahminism

During the latter half of the nineteenth century sections of the sudra castes in Madras Presidency (Vellalas, Kammas, Reddis, Nayars Balija Naidus, Chettis, Nadars etc) were clearly on the rise. Their further advance was partially blocked by the strong positions of authority small groups of Brahmins occupied in public life Brahmins tended to be quite strong also in the leadership of the nationalist movement in Madras, not as a corollary to their Brahminical status, but because their caste group included strata which objectified the contradiction of the Indian national bourgeoisie with the colonial order. At the same time, many of them were imbued with religious and obscurantist ideas. The latter character became extremely pronounced with the revivalism of Annie Besant and the Home Rule League.

[illegible]ve ample justification to non-[illegible] sections who started the Justice [illegible]916, in order to "oppose any [illegible]t would undermine British [illegible] in India who alone are able to hold the scales even between creed and class and develop a sense of unity between warring groups".[50]

Such declarations of loyalty to the government were the rule rather than the exception in the non-Brahmin movement, in the colonial as well as in the post-colonial time In return for its support, the elite expected to find its way into government services "to supplant the Brahmins while keeping the untouchables at a good economic, educational and political distance" [1]

Initially the caste association was a useful tool in the hands of the aspiring civil servants, traders and landowners Its function was not only to establish the respectability of their caste section but at the same time to convince the government that they had the backing of the whole community, and were therefore formidable political allies who should be rewarded The caste community whose needs were largely at variance with that of the self styled leaders, however, before long came under the spell of the nationalist movement By the end of the thirties the scales of support within many Tamilian non Brahmin castes had shifted to Congress, partially under the impact of Kamaraj and as a result the old Justice Party had become practically defunct

While the elitist anti/Brahmin associations were rendered obsolete in the era of mass politics, the Indian National Congress allied itself with the old feudal order, obscurantist ideas and Brahminical institutions and hence called forth a new reaction by Dravidian leaders who perceived the reactionary ideological structures and institutions and not the colonial yoke as the cause of poverty and injustice

"Periyar" Ramaswami Naicker, alienated from the conservative Congress leadership in the twenties therefore decided to leave the MPCC and start the Self Respect Movement, an anti-religious, pro British movement aimed at overthrowing the caste system altogether It insisted on equality between men and women, attracted the lower castes and classes, spread rationalist egalitarian thinking based on the idea that religion and caste institutions are the core of all evil For a brief spell he donned the cap of socialism He organised some meetings against the feudalist zamindari system but abandoned it definitely before long.[5-]

The leadership of the movement, which just before independence turned into the separatist Dravida Kazhagam and after independence into (Annadurai's) DMK, came largely from lower middle classes Gradually DMK and ADMK made their peace with God and gave up the fight against caste Since both parties were integrated into the dominant class structure (national bourgeoisie and landlordism), they were not interested in either realising or propagandising their original programme since it would necessarily entail an uncompromising attack on the economic structures According to B T Ranadive, the earlier form of anti-Brahminist opposition becomes its real content, resulting in compromises both with feudal relations and imperialism The new intelligentsia, the product of Western education nurtured among the non Brahmins, act as a bourgeois intelligentsia, give up the uncompromising principles of their heroes, merge in the ruling party to head its ministries, suppress the people and keep the castes intact[51]

As a matter of fact, the discrepancy between earlier ideology of the non Brahmin movement and the actual practice today is the expression of the iron laws of history while the vast majority of their kinsmen remained socially and economically oppressed, their further mobilisation by the advanced classes would only be along the lines of religious and particularistic sedatives This recourse to illusions in order to mobilise vertically stratified sub-groups of the horizontal classes reveals the potentially reactionary character of caste organisations

Caste Associations

Not all scholars take this view though, and some are even positively enthused by the contributions caste associations have played in the furtherance of democratic and egalitarian ideals in the country Since the Indian masses were politically illiterate write the Rudolphs, the caste associations have played a great role in the success of political democracy by helping India's mass electorate to participate meaningfully and effectively "Rather than providing the base for reaction, caste has absorbed and synthesised some of the new democratic values" According to this view, caste has not only survived but has also transformed and transvalued itself in the sense that it contributes to undermining the inequalities of the old order by helping to level its values and privileges

> By initiating, managing and encouraging the efforts of lower castes to become twice-born, to don the sacred thread symbolising high ritual rank and culture it in effect if not in intention drains the caste hierarchy of meaning by homogenising and democratising it When most men can wear the sacred thread or achieve power and status without it, it will have lost its capacity to divide and distance them from each other. And

by providing a structure for the pursuit of political power, social status, and economic interest, the paracommunity based in caste sentiment and interest makes secular concerns and representative democracy comprehensible and manageable to ordinary Indiains.[54]

Caste sentiment, not class sentiment, should thus provide the structure in which "ordinary Indians" would be marshalled into a position in which they could comprehend representative democracy. The members of the caste associations tend in the early phases to retain the more intense loyalties characteristic of ascriptive associations and to be, as a consequence "less subject to the crosscutting pressures that affect members of more strictly voluntary associations", while in the later phases "its rewards serves to sustain caste loyalty and identification".[55]

Indian politicians seem to have learnt a number of things from the advice by the respectable American political scientists. Many political parties taking part in "democratic politics" in their bid for securing a mass basis have turned to the existing jati structures and sentiments. In conditions of blocked economic development and the crying need for economic reforms it is of major importance for the bourgeois-landlord classes to prevent class consciousness from coming to clear formation. Caste consciousness helps the ruling classes both in diverting sections of the working classes towards a fight against each other and towards a fight for sectional demands, which in turn would consolidate the positions of power of corrupt politicians.

Howsoever casteist, communalist, parochialist, political parties behave for purposes of mobilisation and electioneering, it evolves under the domination of the ruling class forces. The contending ruling groups in general have to resort to group politics in their scramble for political power and economic survival in a crisis-ridden economy. At one time the UP ministry counted as many as 50 ministers. All of them, in their claim for a stake in office and corruption, had to bid for the support of a sizeable social base. The formal identification with specific casteist layers provided itself as a short-cut.

A propagandistic concern for democratic and socialist values seems to determine the interest the so-called backward caste politicians have developed in the machinery of caste reservation. One would have expected the gradual elimination of reservation as the difference between "forward" and "backward" castes narrows down and as the disparities between and within backward communities do not make for a unitary approach on caste lines only. The struggle between reservationists and anti-reservationists, by strengthening caste consciousness, by splitting the ranks of all the suffering people and by tying the masses to communal and corrupt leaders who, at the same time are staunchly entrenched and interested in the continuation of the present socio-economic structures, reinforces the reactionary character of caste politics.

However, the potentially reactionary character of caste politics has not always been able to manifest itself. Caste communities that are economically differentiated between a small wealthy layer at the top and a vast majority of working class, peasants and poor middle classes lose their capacity for independent mobilisation along caste lines, especially if, at the stage that the major civil rights have been attained, secular party politics has managed to come up as a powerful alternative.

For example, the caste associations of Nadars and Ezhavas in the South, embodying considerable educational, commercial and social interests, had to turn away from political organisations to purely social reform movements. Both the Nadar Mahajana Sangam (NMS) and the Ezhava SNDP Yogam as voluntary organisations claiming to represent all members of the ascriptive caste reservoir, could do so only if they withdraw from political involvement, lest the association split.

The NMS, once ardently compaigning for Justice Party and Dravida Kazhegam, in the 1952 elections could do no more than call for the election of a Nadar and from the 1957 elections onwards it had to refrain from issuing any electoral advice at all.[56] In the same way the SNDP was unable to influence the party affiliation of their members and was not in a position to join the communal forces in the struggle which led to the overthrow of the first communist ministry in the state.[57]

Some church organisations which till recently had pontificated among their harijan converts against communism were equally confronted with the dilemma of breaking up the church community altogether or abandoning their political role considerably. The sharp class cleavage in Kerala, for example, between Syrian Catholics, who have shown themselves by and large to be on the side of landlords, plantation owners, rich peasants, merchants, industrialists, etc, and the class interests of non-Syrian Christians and Catholics resulted in political desintegration.[58] A similar development occurred within the Nayar community led by the Nayar Service Society and within the Muslim community. The presence within these ethnic groups, of a large layer of middle classes, however, makes it still possible for the upper classes to maintain their grip over a section of the community along communal and casteist, conservative lines. Even radicalised leaders, like father Vadakkan of the Karshaka Tozhilali Party in Kerala and Shibu Shoren of the Jharkhand Morcha in Bihar under the force of events may, with their sectional-based following, move towards collaboration with leftist class parties but will, with all or part of their following, return to the fold of the ruling class party, as happened during the Emergency.

This experience poses for the leftist movement the problem of whether co-operation with caste or tribe organisations contributes to the undermining or consolidation of the grip of separatism on the peasantry, whether caste organisations can be diverted to class organisations.

In areas where the economic and political class formation has progressed not so far this dilemma does not exist. The reciprocal support of caste and class organisations in the struggle for structural reforms is absent here. Many harijan organisations have become a useful tool in the hands of the landlords to serve their interests under conditions of the desintegration of the jajmani system of contract labour and the rising agricultural tension when the agricultural labourers and small peasants are verging towards independent mobilisation. Although they are often officially patronised, financed and provided with an educated leadership from within the caste with the official aim of uplifting and emancipating the caste community, observers have rightly asked the question, whether the aim is not accommodation rather than emancipation. In a revealing description of one such (Gandhian) movement, the Halpati Seva Sangh, Jan Breman concludes: "The HSS is an organisation for the Halpatis, but not of them. The leadership is solidly in the hands of members of high castes... For [the Halpatis] it is an obscure body, affiliated with the government and representing external interests. It is therefore doubtful whether the HSS may be called an emancipation movement at all. Its aims and methods rather seem to prevent

mobilisation."[59]

LEFT AND DEMOCRATIC MOVEMENT

The most common allegation one hears about the communist movement in India is that it has not paid sufficient attention to caste oppression and that it was only concerned with class struggle, that it mistook the caste society for a class society and hence was bound to remain a foreign body within the Indian context. Catchy assessments of a theoretically bankrupt policy alternate with self-complacent observations about the nearly total impotence of the left.

Such an assessment seems difficult to maintain especially in view of the geo-political differences in India. If there are areas in India which are virtually untouched by communist influence, then this certainly is not due to a theoretically wrong interpretation of the caste factor, since this interpretation is common for the all-India level and has made possible the dominant position of left politics in a number of states and districts. As a matter of fact, it is solely the communist movement which has so profoundly understood the Indian context that in the areas where it is strong caste has lost its strength. It is possibly the greatest achievement of the communist parties that in these areas the caste system has been undermined to a considerable extent, both in its operational and functional aspects. It is by now common knowledge that Bengal and even more Kerala, which till recently represented the most rigid and extreme caste system, have made incomparable progress in this respect.[60]

This development has not been accidental. It has always been part and parcel of the aim of the movement towards social justice and strengthening of democracy. The programme of National Democracy of the Communist Party of India, for example, mentioned specifically:

> It will abolish social and economic oppression of one caste by another, as also all social and personal bans and prohibitions imposed by the so-called upper castes on lower castes, especially the scheduled castes, in the name of custom, tradition or religion. Such oppression shall be made punishable by law. It will pursue a policy of giving financial and other assistance for the educational and cultural advancement of the people belonging to scheduled and socially oppressed castes, to eradicate these inequalities.[61]

The realisation of this aim, according to the communist parties, can only come about as a consequence of the unremitting effort to organise the common fight of all oppressed people against the economic structures which are the direct cause of the continuing caste separatism. This common struggle, moreover, has to be fought within a particularly dangerous context:

> We are familiar in our country with the use of communal appeal to divide the people.... Thus the crisis-ridden bourgeois landlord classes are resorting to the whipping up of diverse divisive and reactionary agitations and movements.[62]

This point is worth bearing in mind when one evaluates the communist reticence towards caste movements. The cautionary approach is reinforced by two other factors. In the first place, it has been the experience that the communist movement on the micro-level has often been identified as a caste party as a result of the massive support it received from the agricultural labourers belonging to a particular caste. The CPI(M) in Thanjavur for example has been pigeon-holed by its enemies as a party of the pallans.[63]

In the second place, the struggle for status amelioration of a particular caste community is a potential danger for the status of the equivalent as well as the higher castes belonging to the same class spectrum. This is the case with the neo-Buddhist movement which shows a growing distance between the Mahar Buddhas and the non-converted Mahars and other harijans, who are making less progress and are hence antagonised. By a voluntary act on a mass scale, it has brought isolation upon itself:

> This isolation has created antagonism and tension and has made the problem of consolidation difficult. There is an alienation from the other Harijan communities. The Nav-Bouddhas have no involvement with the larger Harijan community or even with the problem of untouchability. Having made considerable progress, politically and educationally, they are now concerned with a breakthrough at the level of higher education, and with political alignments with other parties which would be advantageous to themselves. There is no evidence of any desire to take up leadership for the Harijan scheduled castes of the region, let alone the Harijans all over the country.[64]

In view of the three foregoing factors, the communist parties in India keep stressing the need to rescue the masses from the pernicious influence of caste movements. Another, possibly the most decisive factor which makes co-operation with caste agitation totally impossible, is the unwillingness on the side of the caste movements to co-operate with the leftist movement in a common anti-caste fight for democracy. Whether the different democratic movements can be drawn into a broad-based offensive depends not merely on whether the communist parties have attained the stage of absolute theoretical and practical clarity, but ultimately on whether the non-communist democratic currents allow themselves to be drawn into the alliance. Although it is a process of mutual approach,[65] one notices again and again, that all the blame is put on the organised left parties, even if in the particular area they are virtually absent.

The Marathwada riots are very illustrative of this tendency. Although the progressive movement supported the Dalits in their demand for renaming of the University after Ambedkar, the symbol of the pro-British, later pro-Congress, anti-communist revivalism of one of the harijan jatis, the dalit leadership at no time was prepared to look for alliances with the left and thereby fortify its positions against the provoked attack: "The catch is that caste gives them an identity today. They will have to risk losing that in order to work on a broader basis."[66]

Gail Omvedt obstinately refuses to take this into account in a recent article "Class Struggle or Caste War?". Although she mentions that the Dalit Panthers had a traditional suspicion of the left, focused on cultural and religious issues, provoked a split with the other sections and diverted the radical issues to continue their leadership, she puts all the blame on the non-dalits, and particularly on the various shades of communists who are alleged to be "theoretically disarmed [by] the Marxist denial of caste ... Having denied the reality of caste except as an illusory part of the superstructure, it is no wonder that communists have never initiated and led a democratic movement aimed specifically at abolition of caste discrimination".[67]

This, of course is totally at variance with the facts not only in areas where the communists are strong, but even in Marathwada itself. According to the observations of Omvedt herself:

> The left has not neglected Dalits. Communists in fact have stood by them under attack, defied social customs, broken down social barriers in their own lives and in the lives of others. Whether Dalit agricultural labourers have been organised on a village level in a way to give them the strength to really defy the economic and social oppression of the

village rulers, it has been by Communists ...[illegible]

Omvedt fully condones the anti-communist Dhale group which took full control of the movement and provoked a split within the Panthers who had a broadly class revolutionary vision and who wanted to form some kind of unity with all the oppressed. In her explanation of why the split occurred she lines up with the reactionary ideology that it was the "outsiders" who were the ource of Dalit alienation:

> The splits in the Panthers that did occur were stimulated at least to some degree by the intervention of outside political parties and by the heavy-handed way in which the Communists inside the Panthers pushed "class" — *for it became very easy for those still suspicious of Marxism* to believe that this theme was coming from "outside" and represented just another form by which upper caste leftists were *trying to* "use" them.[49]

The familiar story of outsiders, common to Rudolph-Omvedt and the ruling class circles, has been used again and again in order to prevent the more class conscious activists from penetrating into sections which were still imbued with sectional, corporatist consciousness. It overlooks the fact that for harijan labourers harijan entrepreneurs are also outsiders, who, if they start organising all the harijans, definitely have ulterior motives.

The spontaneist emergence of class consciousness has been refuted by history itself. The alleged pernicious influence exercised by 'outsiders' on the anti-caste movement in India has equally been refuted. The first push to the organisation of adivasis, girijans, paraiahs and sudras has been given by 'outside' elements. The crux of the matter, however, is that the 'outsiders' were successful in their anti-caste efforts to the extent that they were able to combine the anti-imperialist and anti-feudalist struggle with the struggle for day-to-day economic demands. The formation of class-conscious classes in the process is a direct function of class-based parties, and has, moreover, continuously been hampered by organisations who want to restrain the consciousness of the Indian people within the framework of caste. Economic development towards full-fledged capitalism alone will not cause the emergence of classes free from caste consciousness. The continuing hold of Christian Democratic Parties on the electorate in Europe shows that the social and political structure in India is not very different from that in Europe.

Caste Conflicts *vs* Growing Unity of Popular Democratic Forces

E M S Namboodiripad

Unlike in Europe where Slave Society succeeded barbarism, in India the ruin and disruption of pre-historic tribal society led to the creation of a society consisting of a large number of social groups or castes, each with its own sense of solidarity. In other words, the factor of class was covered by caste society, which in theory existed in 'age-old' idyllic and self-sufficient village communities.

The destruction of this 'age-old' village system and the development of new capitalist relations in all walks of life — begun by the British and continued since Independence in the midst of surviving pre-capitalist social formations — has led to two apparently contradictory features in Indian society and politics: the emergence of a working class and a growing unity among them as a class; and a disruption of the unity of the working class and the toiling people as evidenced in the increasing conflicts between 'backward' and 'forward' castes, in the intensified attacks on Harijans and other minorities, etc.

These divisions and tensions cannot be simply attributed to the 'casteism' and 'communalism': such divisions and tensions were built into the national movement itself whose leaders were primarily moved -- even when being, for all appearances, thoroughly scientific, modern and secular — by an unhistorical desire to revive the 'age-old' Indian civilisation and culture, based on the idyllic village communities at whose centre was the unalterable division of society into a hierarchy of castes. It is the refusal of millions of Indian people to be bound by the ideology of Varnashrama Dharma, and whose social and political activities, in howsoever distorted a manner, represent a revolt against the open and covert attempts to re-establish the 'age-old' village society that has contributed most to the present continuing 'caste' and 'communal' tensions in Indian society.

THE year 1978 which has just closed was characterised by two contradictory features in the development of Indian politics. On the one hand was the growing unity of the working class, symbolised by the coming together of the Central Trade Union organisations against the Bhoothalingam Report and against the Industrial Relations Bill. On the other hand was the disruption of popular unity, as seen in the conflicts between 'backward' and 'forward' castes; increasing attacks on Harijans in various parts of the country, communal riots, etc.

Indications are available that both these features are likely to continue not only in the present year, but also in the years to come. For, Indian society is going through a phase of its development in which the economy and polity of the capitalist system that has been making rapid progress in India have entered a deep and serious crisis, even while the crisis of the pre-capitalist social organisations has in fact been continuing, rather than getting resolved. The two crises have combined to give a peculiarly tragic character to the socio-cultural and political setup in the country.

For a proper understanding of the nature and depth of such an inter-penetration of the two crises, we should go into the historical roots of India's 'age-old' society. It should be recalled that the break-up of the pre-historic tribal society — what the founders of the Historical Materialism called 'Primitive Communist' society — ending in the formation of class society, took a form in India different from that in countries which developed capitalist society. We should be wary in appying to Indian conditions the formulation with which Marx and Engels opened the first Chapter of their Communist Manifesto: "The history of all hitherto existing society [i e, all written history] is the history of class struggles". What is meant in the above formulation was made clear in the following para:

> Freeman and slave, patrician and plebeian, lord and serf, guild-master and journeyman, in a word, oppressor and oppressed, stood in constant opposition to one another, carried on an uninterrupted, now hidden, now open fight, a fight that each time ended, either in a revolutionary re-constitution of society at large, or in the common ruin of the contending classes.

In place of such an open and clearly demarcated division of "the oppressor and the oppressed in constant opposition to one another" and carrying on an uninterrupted fight, etc emerged in India a society in which the division of and conflict between the oppressor and the oppressed was covered up by an apparent unity in the common organisation of the caste-based village community. Marx himself in his subsequent studies of the social organisation in India on the eve of the consolidation of British power had drawn attention to the "so-called *village system* which gave to each of these small units their independent organisation and distinct life". Quoting an old official report of the British House of Commons on Indian affairs, Marx went on:

> Under this simple form of municipal government, the inhabitants of the country have lived from time immemorial. The boundaries of the villages have been but seldom altered; and though the villages themselves have been sometimes injured, and even desolated by war, famine or disease, the same name, the same limits, the same interests, and even the same families, have continued for ages. The inhabitants gave themselves no trouble about the breaking up and divisions of Kingdoms; while the village remains entire, they care not to what power it is transferred, or to what sovereign it devolves; its internal economy remains unchanged. The potail [Patel] is still the head inhabitant, and still acts as the petty judge or magistrate and collector or rentier of the village.

To these quotations from official sources, Marx adds his own comment:

> These small stereotype forms of social organism have been to the

[illegible] part dissolved, and are dis[appe]aring, not so much through [the b]rutal interference of the British [tax-gathere]r and the British soldier, [as to] the working of English steam and English free trade. Those family-communities were based on domestic industry, in that peculiar combination of hand-weaving, hand-spinning and hand-tilling agriculture which gave them self-supporting power. English interference having placed the spinner and weaver, dissolved these small semi-barbarian, semi-civilised communities, by blowing up their economic basis, and thus produced the greatest, and to speak the truth, the only social revolution ever heard of in Asia.

Studies and researches by a host of scholars have subsequently shown that Marx's remarkable insight into the nature of Indian society and the change brought into it by the new British rulers had many gaps to be filled, many lags and short-comings in the picture that he painted. For, a literally "unchanging Indian society" was not entirely true. Changes, in fact, were imperceptibly creeping into the society — changes into whose details Marx was not then going or did not intend to go.

What Marx was trying to point out was — and here he was absolutely correct — that the type of "uninterrupted, now hidden, now open fight, a fight that each time ended, either in a revolutionary re-constitution of the society at large, or in the common ruin of the contending classes", which was characteristic of European countries, did not take place in India. The result is that, instead of a vigorous dynamic society that grew up in Europe through the open slave revolts in ancient times, serf uprisings in the medieval age, etc, India with its caste-based village system had inherited an apparently 'stable' (which means stagnant) society. It was this 'stability', or rather stagnation, [th]at the heaviest blow was struck by [the] British rulers. It is impossible to [disagr]ee with this basic analysis of the [evolu]tion of Indian society through [the] ages, without necessarily dotting [all] the 'i's and crossing all the 't's of [what] Marx wrote on pre-British Indian [society].

[It w]ill in this context be instructive to [recall] the profound analysis made by [Marx's] brilliant collaborator, Frederick [Enge]ls, of the role played by Slavery [in] the development of human civilisa[tion]. Slavery did, according to Engels, [become] the dominant form of produc[tion] among all the peoples who were developing beyond the old community but in the end was also one of the chief causes of their decay".

The "decay" of the Slave Society referred to by Engels however led to bitter conflicts which culminated in the replacement of Slave society by the Feudal society. In this latter too, bitter conflicts developed ending in the substitution of Feudal society by Bourgeois society.

> It was slavery that made first possible the division of labour between agriculture and industry on a larger scale and thereby also Hellenism, the flowering of the ancient world. Without slavery no Greek State, no Greek art and science; without slavery, no Roman empire. But without the basis laid by Grecian culture and the Roman empire, also no modern Europe. We should never forget that *our whole economic, political and intellectual development presupposes a state of things in which slavery was as necessary as it was universally recognised. In this sense we are entitled to say: Without Slavery of antiquity no modern socialism* (emphasis added).

The brilliant collaborator of Marx was careful to add:

> We are compelled to say — however contradictory and heretical it may sound — that the introduction of slavery under the conditions prevailing at that time was a great step forward. For, it is a fact that man sprang from the beasts, and had consequently used barbaric and almost bestial means to extricate himself from barbarism. *Where the ancient communities have continued to exist, they have for thousands of years formed the basis of the cruelest form of state, oriental despotism from India to Russia* (emphasis added).

In India too, it can be seen, pre-historic barbarian society was broken up. Here too man used "almost bestial means to extricate himself from barbarism". But as distinct from Europe where the "bestial means" took the form of Slavery, in India we witness the emergence of caste society.

The caste society of historical times was different from the pre-historic tribal society in that the technique and mode of production had become advanced. Enough was produced for a narrow upper stratum of society to be able to live at the expense of the overwhelming majority of the toiling people. The division of society into the three Varnas — the Kshatriya, the Brahmana, and the Vysia — and the rest consisting of the Sudras, was the first division of society into classes in India. But everyone of the four Varnas and the innumerable castes that took shape in the subsequent periods retained, at the level of the particular caste, the same consciousness and organisation which had kept the previous tribes together. The ruin and disruption of the pre-historic tribes, in other words, led to the creation of a society consisting of a large number of social groups or castes, each with its own sense of solidarity. The factor of class was thus covered up by caste society.

The great merit of Slave Society as analysed by Engels was that (a) it led to the flourishing of culture and civilisation; and (b) when the system gradually declined and decayed, the internal conflict within society — between the owners and the slaves, between lords and serfs and so on — led to the further development of culture and civilisation. The epoch of modern capitalism which gave birth to the bourgeois renaissance was the logical culmination of this never-ending process.

In India too, the establishment of Varnashrama society did lead to a flourishing of culture and civilisation. Ancient India could successfully compete with any civilised nation of that time, including Greece and Rome, in the richness of its contribution in the field of philosophy, sciences, arts, literature, etc. Unlike Greece and Rome, however, India did not witness the vigorous social conflicts out of which ancient Greece and Rome paved the way for the emergence of Modern Europe.

In other words, the decay of Slave Society in Europe did not lead to the decay of society as such; it was rather the decay of slavery against which there were powerful forces, and whose struggle ended in the reconstitution of society. In India, on the other hand, the decay of Varnashrama society led to the decay of society. The flourishing of culture and civilisation, which was the characteristic feature of the early Varna society, came to be disrupted and stagnated. The scientific spirit, the materialist outlook, the closeness to the working people — these were the characteristic features of the philosophers, scientists, technologists, etc, in ancient India. These however were forced into subjugation by the dominant classes or castes who came to occupy positions of power.

Reference may in this context be made to the conclusions arrived at by the eminent Marxist philosopher, Debi-

prasad Chhatopadhyaya, in his well-known works such as "The Lokayata", "What is Living and what is dead in Indian Philosophy", "Science and Society in Ancient India", and so on. We can see in these works not only ancient India's valuable contribution to world culture but also the impediments put in the way of its further development by the formation and consolidation of the caste-based society that took shape here. No other part of the world perhaps has had such a great promise for the future in ancient times, but such a miserable development in its subsequent days, as India, thanks to the formation and consolidation of the caste-based village community in India.

It is to this past that the bourgeois-led national movement has always appealed in its attempt to rally the masses. It may be noted that the most powerful and dynamic ideology with which the Indian bourgeoisie rallied the masses, the peasants in particular, was the revival of the 'age-old' Indian society based on the caste-based village system. Mahatma Gandhi who made the most significant contribution to the mobilisation of the Indian people (peasants in particular) against the British rulers worked out a complete scheme of rejecting the machine age and going back to the Charkha and other village industries. The anti-imperialist movement took this ideology of revivalism to its logical end — that of reviving the 'glories' of ancient (which means Hindu) civilisation.

How tight is the grip of this revivalist ideology on the people even in this last quarter of the present century, is seen in the fact that the Janata Prime Minister and the leaders of the two Congresses, along with such venerable leaders as Vinoba Bhave, Jayaprakash Narain and Acharya Kripalani, are united in giving top priority, among the social problems facing the country, to the implementation of two Hindu revivalist slogans — ban on cow slaughter and prohibition. To cap it all is the Prime Minister with his preaching of urine therapy!

Continuing his analysis of pre-British Indian society and its destructon at the hands of the British rulers, Marx goes on:

> Now, sickening as it must be to human feeling to witness those myriads of industrious patriarchal and inoffensive social organisations disorganised and dissolved into their units, thrown into a sea of woes, and their individual members losing at the same time their ancient form of civilisation, and their hereditary means of subsistence, we must not forget that these idyllic village communities, inoffensive though they may appear, had always been the solid foundation of Oriental despotism, that they restrained the human mind within the smallest possible compass, making it the unresisting tool of superstition, enslaving it beneath traditional rulers, depriving it of all grandeur and historical energies. We must not forget the barbarian egotism which, concentrating on some miserable patch of land, had quietly witnessed the ruin of empires, the perpetration of unspeakable cruelties, the massacre of the population of large towns, with no other consideration bestowed upon them than on natural events, itself the helpless prey of any aggressor who deigned to notice it at all. We must not forget that this undignified, stagnatory, and vegetative life, that this passive sort of existence evoked on the other part, in contradistinction, wild, aimless, unbounded forces of destruction and rendered murder itself a religious rite in Hindostan. We must not forget that these little communities were contaminated by distinctions of caste and by slavery, that they subjugated man to external circumstances, that they transformed a self-developing social state into never-changing natural destiny, and thus brought about a brutalising worship of nature, exhibiting its degradation in the fact that man, the sovereign of nature, fell down on his knees in adoration of Hanuman, the monkey, and Sabala, the cow.

Marx the revolutionary thus did not shed a single drop of tear for the destruction of the 'age-old' civilisation of India, while Marx the humanist had full sympathy for and sense of solidarity with the millions who lost their all at the hands of the British. Marx the revolutionary thinker had the perception to see that all the destruction, all the miseries, all the sufferings, all that myriads of men and women were the signals of a new civilisation which was to be ushered in. At the same time, he had the revolutionary vision to see that "the Indians will not reap the fruits of the new elements of society scattered among them by the British bourgeoisie, till in Great Britain itself the now ruling classes shall have been supplanted by the industrial proletariat, or till the Hindoos themselves shall have grown strong enough to throw off the English yoke altogether". He was thus waiting for the day when either a proletarian revolution in England itself, or the freedom struggle launched by the Indian people would create an entirely new socio-cultural, political and economic realignment in India, so that the 'age-old' Indian society would be replaced by a sovereign democratic modern India on par with any other civilised country.

The first of the two eventualities envisaged by Marx, a proletarian revolution in England, has not taken place. But the second eventuality — the Indian people themselves throwing the British yoke off their shoulders — has been realised. It is more than 31 years since India became an independent and sovereign nation, ruled by the elected representatives of the Indian people themselves. Nevertheless, the desirable outcome of such a change over in the political-administrative setup is not visible.

The process begun by the British rulers — the destruction of the 'age-old' village system and the development of new capitalist relations in all walks of social life — has of course been further accelerated. But the consciousness and organisational structure of society leading to conflicts, arising out of the caste-based village system, are still a major factor in the day-to-day life of millions of our people. The very political-administrative system which is apparently based on secularism and democracy is penetrated by the consciousness and loyalties of the caste-based village system. The caste-conflicts, the communal riots, etc, of recent years provide irrefutable proof of this fundamental reality.

It is necessary in this context to be cautious about the idea that is very common among political pundits and leaders – the idea that the influence of caste in socio-cultural life is increasing. On the other hand, caste is today far weaker in the day-to-day life of our people even in remote villages than, say, a generation ago. Inter-dining has become common, even inter-marriages are not so rare as they were a generation ago. 'Lower' castes are today much better off than a generation ago, though the majority of the scheduled castes, scheduled tribes and several other backward communities continue to suffer from their inferior status in society. They have in general acquired power to organise resistance and to stand up for their rights.

As a matter of fact, it is this capacity of the scheduled castes, scheduled tribes and other backward communities to resist oppression that acts as one of the

contributory factors giving rise to tensions and conflicts between 'higher' and 'lower' castes in the villages. The rural gentry, belonging mostly to the 'higher' castes, find that their writ runs no more unchallenged. This 'arrogance' on the part of the 'lower' castes so infuriate them that they decide to organise themselves, even to arm themselves, in order to protest their rapidly-losing grip over village society. The 'lower' castes for their part, either by themselves or in alliance with the poorer sections in the 'higher' castes, and with the assistance of secular democratic and left-minded parties and organisations, defend themselves and assert their rights This defence of the 'lower' castes becomes effective wherever they fight not merely as particular castes, but as part of a common mass movement embracing within its fold the radically-oriented sections belonging to all castes, communities, organisations and parties. On the other hand, wherever they are isolated from the common left and democratic movement, they fall and get crushed by the ruling gentry working in collaboration with the officialdom.

What is therefore significant from the long-range perspective is that the development of capitalism and its inevitable reflection in political life — the development of democratic political institutions — are uniting the mass of the Indian people regardless of the caste to which they belong, whether they belong to the 'high' or 'low' castes, the poor and down-trodden are coming together fighting for democracy and defending their class interests. Common organisations such as Trade Unions and Kisan Sabhas on the one hand and political parties fighting for democracy and national advance in a radical direction on the other are bringing the people together in joint struggles on economic, political as well as social-cultural issues cutting across all differences of castes, religious communities and other sectarian groups. Unity of the working class in action referred to earlier in this article is only one, though a very significant instance of this growing trend.

This however does not mean that the differences based on castes, religious communities, etc, have ceased to exist. On the other hand, while their role in socio-cultural life is gradually declining, their role in politics and administration is growing. Caste and other sectarian considerations are percolating into such secular organisations and movements as the Trade Unions and other mass organisations of the fighting people, as well as political parties which are considered to be above these sectarian considerations. It will not be too much of an exaggeration if one were to state that the role of the castes, religious communities and other sectarian factors in present-day social life is in inverse proportion to their role in political-administrative life of the country.

This is not surprising, considering the circumstances in which the secular democratic institutions and movements had their origin and development in our country. The various streams of the movement for modernising Indian society, beginning with the socio-cultural reform movement launched in the first half of the last century in Bengal, through its variants in other parts of the country, were all so many attempts at grafting the modern bourgeois culture on to the living plant of the 'age-old' Indian civilisation and culture. Even the most radical of these social reform movements made serious compromises with the essential elements of what they were supposed to destroy. They were not based on the recognition that 'age-old' Indian culture in which every Indian patriot is supposed to take pride was a culture of stagnation and decay; that no amount of mending it will lead the country towards genuine modernisation. The whole attempt therefore was to preserve as much of the old as could be preserved, while imbibing all those that appeared 'good' in the new.

This however was not confined to socio-cultural life but extended to politics and economy as well. The movements for modernising the polity and economy of the country initiated by the early nationalists, and carried forward by the subsequent generations headed by such outstanding leaders as Ranade, Naoroji, Tilak, Gandhi and Nehru were, in the final analysis, attempts to compromise with the national enemy — foreign rule — and with the outmoded pre-industrial economy. Nowhere was this more visible than in the philosophy and practice of Mahatma Gandhi based on non-violent, non-cooperation, restoration of the Charkha and the village industries, scrupulous adherence to moral values and loyalty to such moral principles as banning cow slaughter and prohibition. What Jawaharlal Nehru — the apparent rebel against but in reality the disciple of Mahatma Gandhi — did was to give a 'modernist', 'leftist' covering to his perceptor's programme of compromise with the alien rulers outside and with the outmoded socio-cultural institutions inside. The Gandhi-Nehru epoch, which is considered to be the most significant from the point of view of national mobilisation for all-round modernisation, was in short an epoch of compromise with those very forces against which the people were supposed to be fighting.

The natural consequence of this compromise made by the bourgeois leadership with the ideologies and institutions of pre-capitalist society was that, by the time the bourgeoisie took shape and organised itself as a class and proceeded to rally the nation behind it, found its own class unity broken. What are now known as the "fissiparous" tendencies such as casteism, communalism, etc, are the twin brothers and sisters of nationalism as it took shape in India. It is worth noting that within less than half a century of the birth of the Indian National Congress which aspired to become the representative of the entire nation, it had to face challenges from such rival organisations as the Muslim League; the Justice Party and other organisations of the non-Brahmins in the then composite provinces of Madras and Bombay; the organisations of the scheduled castes and other oppressed sections of Hindu society; etc.

The challenge thrown to the Indian nationalists by Lord Birkenhead, the then Secretary of State for India, in the mid 1920s to produce a united draft constitution for free India; the response to it by way of the all-Parties Committee which produced the Nehru report (of 1930); the bitter quarrels among those represented at the Round Table Conference and between most of them and the Indian National Congress culminating in the fiasco of the Conference; these are the most eloquent facts showing the basic weakness of the national freedom movement headed by the Indian bourgeoisie.

All this was conveniently blamed on the 'wily manouvres' of the British rulers and the 'lack of patriotism' on the part of the caste and communal leaders. Mahatma Gandhi made the heroic statement that, if only the British rulers left India to her fate, all the caste and communal problems would be solved immediately and automatically. The total unreality of this assertion was proved not only by the large-scale massacres that accompanied

the partition of India — massacres which are perhaps the most inhuman in the history of mankind — but by the fact that, after full 31 years of independence, India today is as politically divided as it was in the pre-independence days on caste and communal lines. Those nationalists who even today blame caste and communal organisations for all the evils that are overtaking our country should ponder over the question of why they (the caste and communal leaders) are able to release the worst kind of sentiments among the people for inciting the most inhuman atrocities on the scheduled castes, scheduled tribes and backward communities.

Lest it should be thought that this is an attempt to justify all that the British rulers did, let it be made clear that all the British statesmen, from Morley and Minto to Wavel and Mountbatten, deserve the most unreserved condemnation for resorting to the worst kind of manouvres against Indian's freedom movement. 'Divide and rule' was the classical strategy of the British rulers, as it has been the strategy of earlier imperialist rulers They did their utmost to set the various castes and communities against the growing aspirations of the Indian people for freedom, to disrupt the growing unity of the Indian people. Even in the immediate post-independence years, Governor-General Mountbatten and Commander-in-chief Auckinluck, as has now been revealed, made the utmost efforts to set India and Pakistan against each other. The question however remains: why were they able to do so? No genuine nationalist can evade this question.

The answer is implicit in what is stated in the early paras of this article. The national movement, as was sought to be built up by its bourgeois leaders, was primarily a movement for the 'revival' of the 'age-old' Indian civilisation and culture. This civilisation and culture, let us remind ourselves again, is based on the village community at whose centre is the division of society into a hierarchy of castes. Millions of people who had, out of sheer helplessness, borne the burden of this caste-based society, were for the first time able to see that they need no more be bound by the ideology of Varnashrama Dharma They started imbibing a part of the modern bourgeois ideology — freedom, equality and fraternity. They were not prepared to tolerate a movement which would culminate in the replacement of the then ruling British imperialism by the old Varnashrama society.

At the same time, the driving out of the British rulers was understood by the leaders of the Muslim community as the revival of the 'glorious Moghul empire'. Everyone — the Muslims, the Christians, the depressed classes, non-caste Hindus — raised the question: "What will happen to us when the British are thrown out and a democratic political system is set up?"

The demand for safeguards for the religious minorities, non-caste Hindus, etc, became part of the general political environment. Separate electorates for the minorities, reservation for backward communities and minorities in services — these became the slogans with which every caste and communal organisation challenged the right of the Indian National Congress to represent the whole nation Mahatma Gandhi, the idol of millions, came to be completely isolated in the Second Round Table Conference from where he had to return empty-handed, to land himself and his colleagues into prison.

Did the bourgeoisie learn any lesson from this? Did it not, on the other hand, persist in the same policy? Has

it not become a matter of practice for the most popular leaders of bourgeois political parties to pay obeisance to all that is outmoded and obscurantist in Indian society and culture — Sadhus, Babas, and so on? Have we not witnessed the shameful sight of naked Sadhus — naked not figuratively but literally — making a demonstration in the capital city of the country and one of them being invited to and attending a conference presided over by the then lady Prime Minister? Is it not against the background of such a general obeisance to obscurantism that the slogan of Hindu Rashtra has arisen and been made the rallying cry of a para-military organisation?

There are of course several bourgeois leaders who try to be secular, make honest attempts to act in a secular way It is not the intention of the present writer to underestimate the contribution made by such leaders to the development of the secular democratic movement. But it is one thing to attack some of the anti-secular practices of particular parties, organisations and individuals, *it is quite another to make* an all-sided attack on the very basis of anti-secularism. If one is to adopt the latter position, one has to abandon all ideas of paying tributes to the 'age-old' civilisation and culture of India. One has to realise that the rebuilding of India on modern democratic and secular lines requires an uncompromising struggle against the caste-based Hindu society and its culture. There is no question of secular democracy, not to speak of socialism, unless the very citadel of India's 'age-old' civilisation and culture — the division of society into a hierarchy of castes — is broken. In other words, the struggle for radical democracy and socialism cannot be separated from the struggle against caste society.

Radical nationalists should in other words have a second look at what they contemptuously call 'caste and communal organisations' and the slogans they raise. Like the Indian National Congress and other secular democratic movements led by the bourgeoisie, these caste and communal organisations too have played a positive as well as a negative role in the development of Indian politics. Their negative role is obvious in the fact that all of them objectively — and many of them even subjectively — sided with the British rulers against the Indian peoples' demand for freedom and democracy.

It would however be onesidedness to see this to the exclusion of the fact that they were (though in a distorted form) raising the banner of revolt against the Establishment in the 'age-old' Indian society. They were demanding that the holy of holies in society, politics and administration, should not continue to be the monopoly of the 'high caste' Hindus. They were in fact staking a claim for a share in the power which the 'high caste' Hindus were preserving for centuries.

However distorted in form, this was a demand for democracy. It became so irresistible that the very nationalist leaders who claimed to oppose all forms of casteism and communalism had to agree to reservation for the Scheduled castes and Scheduled tribes not only in Parliament and state Legislatures but also in government services and educational institutions. In some parts of the country where the non-Brahmin movements had come to be well organised and become strong — such as the present-day states of Kerala, Tamil Nadu, Andhra Pradesh, Karnataka and Maharashtra — reservation even for other *backward communities both in government* services and in educational institutions has been built into the political administrative system. The agitation that is now going on in Bihar, and to a lesser extent in UP, for reservation is in fact a demand for the extension to the northern states of what has been continuing in the above-mentioned southern states for almost half a century.

Mention should also be made of the fact that from the ranks of the caste organisations of the non-Brahmins has arisen what is known as the rationalist movement. The emergence of Ramaswamy Naicker, the leader of the left wing in the Justice Party, was the signal for similar movements in other parts of the country, particularly in South India Once they took shape however, they were not confined to particular castes. They embraced radical elements from all castes and communities. Many of them found it quite natural to join the Socialist and Communist movement.

It would thus be erroneous and unhistorical to divide the social and political organisations in the country as 'caste and communal' on the one hand and 'national' on the other — the former being 'black' and the latter 'white'. It would however be equally erroneous and unhistorical to look upon these caste and communal organisations as 'revolutionary'. They in fact are as compromising as the more 'national' organisations of the bourgeoisie, such as the Congress. Their compromising attitude towards British imperialism is obvious from the fact that they were used by the British rulers against the national demand for freedom raised by the Congress.

But their compromising trend is seen also in their attitude to the basic structure of Indian society. While fulminating against the caste system — some of them even against religion in the abstract — they failed to see the connection between the struggle against the Establishment (which they were supposedly waging) and the growing organisations of the working people. As a matter of fact, at the very time when they were raising the banner of revolt against the caste-based Establishment and even religion, the fighting organisations of the working people were rapidly growing and getting consolidated through class struggle. The significance of this for the final victory of their own *anti-Establishment struggle was not* seen by them. Hence the wide gulf between them and the left democratic political parties and mass organisations in the country.

The political implications of this may be seen in the fact that most of the present-day caste and communal organisations have put themselves outside the pale of the growing left and democratic movement They use the political leverage they have, the support of the particular caste and communities to which they cater, for making political bargains with this or that bourgeois political party. The leaders of the latter, in their turn, are making opportunist use of such caste and communal organisations, raising or opposing the particular slogans raised by these organisations not on the basis of any principle but for purely temporary political and electoral gains.

In such a situation where the bourgeoisie has failed to unite the nation and has landed the people into the utmost political chaos, it is necessary for the working class, as well as all forward-looking radical secular democratic forces, to make a completely objective assessment of the caste and communal situation as part of the overall national situation. They should realise that, in spite of all the distortion that are taking place and may repeat themselves in the future too, the

unity of all sections of the working people, all the forward-looking democratic forces in the country, for the total modernisation of the country in its socio-cultural, political and economic aspects is growing and is bound to grow. It should be the effort of every honest radical democrat to see that this unity is strengthened day by day.

It is at the same time necessary for them to realise that the struggle waged by the millions belonging to the hitherto-oppressed castes and communities is an integral part of the struggle for secular democracy. Unity of the radical and democratic forces within the 'forward' castes and communities with the 'backward' communities is an essential element both for safeguarding the interests of the 'backward' communities as well as for the advance of democracy in general.

Looked at from this point of view, the demand for reservation made by the backward communities will be found a just demand. It should however be noted that this just demand is being raised and pushed forward in a manner in which the working people belonging to the 'forward' communities are pitted against the 'backward' communities. Class unity on the basis of common slogans and demands for democracy is sacrificed for the sake of 'unity' between the exploiters and the exploited in particular 'backward' as well as 'forward' communities. This is a trend which can endanger democracy.

Before concluding, it may be useful to relate the personal experience of the present writer in dealing with the question of reservation for backward communities in his home state of Kerala.

As was noted above, the demand for reservation of backward communities had become part of the democratic movement in South India. In all the three parts of the present-day Kerala State — Malabar, Cochin and Travancore — this principle had thus come to be accepted both in the political programme of the radical nationalists and in the practices of the governments. The new state of Kerala which was formed in 1956 and of which the present writer happened to be the first Chief Minister therefore had the system of reservation for 'backward' communities' written into the administrative system.

However, there were [illegible] 'backward' communities (other than Scheduled castes and Scheduled tribes) from whose ranks had arisen small groups of well-to-do elements — landlords, business-men, upper layers of the professionals, top government officials, etc — though the bulk of the community suffered not only from poverty but also from the hang-over of the centuries-old caste oppression. At the same time, increasingly larger and larger sections from the 'forward' communities were becoming impoverished and forced to seek jobs and work under bosses many of whom belonged to 'backward' communities. It was not an uncommon sight to see that a driver, a peon or a domestic servant belonged to the 'forward' community and therefore did not enjoy the benefits of reservation, while their bosses belonged to the 'backward' communities and were therefore the beneficiaries of the benefits accruing from the reservation system.

It was under these circumstances that the first ministry in Kerala formed an Administrative Reforms Committee one of whose terms of reference was the question of reservation. The committee recommended that:

(a) Reservation for the Scheduled castes and Scheduled tribes should continue unchanged;

(b) In the case of other "backward" communities reservation should continue but its benefit should be denied to those who were above a particular limit of family income.

Ever since then, the question was hotly debated whether reservation should continue, and if it did, whether the reservation should be based on caste or economic status. The leaders of 'backward' communities naturally demanded that it should be based purely on castes; that the provision proposed by the Administrative Reforms Committee for exempting those having an income above a particular limit from the benefits of reservation should be abandoned. The leaders of the 'forward' communities, on the other hand, demanded that reservation should be purely on economic status. What is today being witnessed in Bihar was witnessed in Kerala almost two decades ago.

The proposal made originally by the Administrative Reforms Committee was not accepted by any political party and had therefore to be abandoned. It however was taken over by another committee appointed a decade later which submitted its report in the early 1970s. By this time the political temper in the state had changed so much that every political party — ruling and opposition — accepted it. The Achutha Menon government declared its acceptance and announced that steps were being taken to implement them.

Both the 'forward' and 'backward' communities however launched a tirade against it. And the present Ministry headed by Vasudevan Nair has, under political pressures exerted by the caste and communal leaders, announced its decision to reject the proposal and constitute a new committee to go into the whole question afresh. It is thus obvious that Kerala is going to witness once again what it has been witnessing for nearly quarter of a century and what the Northern states like Bihar are witnessing today.

MSFC

MAHARASHTRA STATE FINANCIAL CORPORATION (MSFC) has greatly increased its assistance for educated unemployed technicians — qualified and experienced, qualified but without experience and experienced but without qualifications. All these schemes were started in the last few years, the Young Technicians Assistance Scheme being less than one year old. According to Homi J H Taleyarkhan, chairman, 2,794 persons under this category have benefited from MSFC loans to the value of Rs 14.10 crores. In the first nine months of 1978-79, 405 persons have been assisted with loans aggregating Rs 2.44 crores. As many as 24 cases for seed capital have also been sanctioned for an aggregate of Rs 14.33 lakhs. In developmental finance for encouraging inventions or prototypes and in schemes for modernisation of machinery also, one dozen small units have been assisted with nearly Rs 10 lakhs in the first nine months of the current year. World Bank loans for import of machinery not available in India have been given to 285 units with aggregate sanctions of about Rs 20 crores. The number of units assisted in the first nine months of 1978-79 is 30 with sanctions of Rs 2.84 crores. Loans of Rs 18.44 crores for commercial vehicles on road and on water have been given to 4,193 units, including sanctions of Rs. 1.31 crores during April-December last.

Caste, Class and Property Relations

B T Ranadive

Nationalist tradition in India looked upon the struggle of the lower castes against the domination of the upper castes as a diversion from the general anti-imperialist struggle. The caste question was considered to be an internal affair of the Indians who, in spite of all the differences and inequalities among them, were expected to first fight for the freedom of the country, under the leadership of the bourgeoisie.

At the same time, there was another current which held that India was unfit for freedom till the people first overcame the inequalities of the caste system. This current was represented by certain social reformers coming from upper castes whose bourgeois democratic consciousness was appalled by the monstrous iniquities of the caste system and other obscenities of Hinduism.

In essence, both these traditions sought to de-link the anti-caste struggles from the contemporary democratic and class struggles; they sought to circumscribe the anti-caste struggle within the framework of the existing political and economic system.

The present article makes a broad survey of both these traditions and argues that while anti-caste struggles, even when they apparently take on the form of a demand for reservation of jobs, etc, should be supported, what is called for is a deeper struggle, embracing the oppressed of all castes, against the present socio-economic system which is based on certain property and production relations which sustain both caste and class oppression.

THE survival of the caste-system and prejudices today as well as the fight against it cannot be understood unless viewed in relation to the major political and economic developments in the country during the 19th and 20th centuries

The major political development was the rise of nationalist anti-imperialist consciousness and the rising anti-imperialist struggle accompanied by the struggles of workers and peasants which forced the British to withdraw from India.

Single Process

The anti-imperialist struggle, the growing sense of national unity, the anti-caste agitations and revolts, were all parts of a single process — the formation of a modern nation, with its different sections demanding equality and common status in a new polity. The process was gradual and slow with different castes and sub-castes expressing the urge in different ways in the beginning. Some directly addressed themselves to the fight against imperialist rule, others started awakening to their unequal status in Hindu society and embarked upon a struggle against caste inequality. At a later stage these various struggles merged to a great extent in the common struggle against imperialism, though some continued their separate existence till the end. In reality this was a process of the dissolution or, rather, undermining of the old Hindu order with its hereditary caste system. Marx underlined this process of undermining and dissolution. He said "All the civil wars, invasions, revolutions, conquests, famines, strangely complex, rapid and destructive as their successive action in Hindustan may appear, did not go deeper than its surface. England has broken down the whole framework of Indian society, without any symptoms of reconstruction yet appearing. This loss of his old world, with no gain of a new one imparts a particular kind of melancholy to the present misery of the Hindoo, and separates Hindustan, ruled by Britain from all its ancient traditions and from the whole of its past history". Marx was not sorry that this old world of the Hindoo was crumbling. He knew it was based on monstrous caste distinctions and slavery. "We must not forget that these little communities were contaminated by distinction of caste and by slavery, that they subjugated man of external circumstances instead of elevating man the sovereign of circumstances, that they transferred a self-developed social state into a natural destiny, and thus brought about a brutalising worship of nature exhibiting its degradation in the fact that man the sovereign of nature fell down on his knees in adoration before Hanuman, the monkey, and Sabala, the cow".[1]

It was not in the interests of the colonial rule to transform the Indian society. The process of changing the old society, its stratification and economic basis was slow and painful. The result was superimposition of minimum modern capitalist relations on the old feudal land relations which sustained the caste system. The exploitation interests of British colonialism required that a powerful indigenous bourgeoisie should not arise. It was interested in exploiting the Indian people on the basis of their backwardness, i e, keeping the rural land relations intact as far as possible, modifying them only to advance its own interests.

Two contradictory processes were therefore in action. The introduction of modern relations — railways, communication, telegraph, workshops and a few factories, growing commodity exchange, exports and imports — accentuated the tendency towards undermining the old structure, and with it the caste relations. Secondly, the vital interests of the colonial powers in maintaining the old land relations, in seeking political and economic support from the feudals, meant support to the fabric of caste institution.

Revivalism and Compromise

The leaders of the national movement, the new bourgeois intelligentsia coming from Hindu upper castes, were also interested in compromising with the caste system. One can imagine the backward economic conditions prevailing a hundred years ago. The intelligentsia just learning the alphabet of anti-imperialist struggle, without yet a solid foundation of support of the indigenous industrial bourgeoisie, stood in isolation from the downtrodden masses and was extremely afraid of hurting the religious susceptibilities of its immediate followers. Besides, the Indian nationalists, in their struggle against the British, harked back to India's past to draw sustenance for its claim to democracy and freedom. It led to revivalist thinking and ideology.

...se from the existing foul welter of decaying and corrupt meta-... from the broken relics of the ... village system, from the dead remains of court splendours of a vanished civilisation, they sought to fabricate and build up and reconstitute a golden dream of Hindu culture — a 'purified' Hindu culture — which they could hold up as an ideal and a guiding light. Against the overwhelming flood of British bourgeois culture and ideology, which they saw completely conquering the Indian bourgeisie and intelligentsia, they sought to hold forward the feeble shield of a reconstructed Hindu ideology which had no longer any natural basis for its existence in actual life conditions. All social and scientific development was condemned by the more extreme devotees of this gospel as the conquerors' culture; every form of antiquated tradition, even abuse, privilege and obscurantism, was treated with respect and veneration.[2]

The opposition to Western ways was of course combined with demands for democracy and industrial advance. The revivalist bases meant defence of the caste system, its maintenance and failure to fight it. Tilak expressed his opposition to any kind of social reform including the proposal to raise the age of marriage. Tilak believed in the caste-system and defended it. Even Gandhi who represented a different stage of the national movement equally relied on revivalism. During the first non-co-operation movement he carried on an open campaign against everything Western, including Western medicine, Western education and the railways. Gandhi once declared: "God limited man's locomotion power when he gave him two legs. But man became ambitious and built the railways". In these days he repeatedly harped upon bringing back Ram Raj to India. No doubt in subsequent years his appeal became less modern, more 'bourgeoisfied'; but notwithstanding his onslaught against untouchability, he remained a prisoner of revivalist outlook. As early as 1921 he declared himself to be a Sanatanic Hindu: "I call myself a Sanatanic Hindu, because (1) I believe in the Vedas, the Upanishads, the Puranas and all that goes by the name Hindu scriptures, and therefore in Avatars and rebirth. (2) I believe in Varnashrama Dharma, in a sense in my opinion strictly Vedic, but not in its present popular and crude sense. (3) I believe in the protection of the cow in its much larger sense than the popular. (4) I do not disbelieve in idol-worship".[3]

This was the ideology of the father of the nation who headed the Congress during the days of the national anti-imperialist struggle. In spite of this ideology he could move lakhs for the national struggle and make them momentarily forget their caste distinctions. It was he again who was able to bring lakhs of Muslims into the common struggle in 1920-21. But it was clear that with this revivalist outlook, with this delinking of the anti-caste struggle from the anti-imperialist struggle, caste distinctions would continue to survive. With this outlook of course it was not possible to eliminate the barriers between Hindus and Muslims.

Notwithstanding the advanced and secular views of Jawaharlal Nehru, the Gandhian outlook dominated the nationalist movement. Critics have wrongly understood this obscurantist outlook as only surrender to caste-pressures and considered it as being due only to the casteism of the upper caste national leaders. It was basically the surrender of the modern intelligentsia before the indigenous feudal land relations which sustained the caste system. Not that subjectively there was no caste-consciousness, for it was inevitable if you accepted the basically unjust agrarian structure.

Fear of Agrarian Revolution

Such was the double faced intelligentsia of the earlier years. Espousing the aims and interests of the rising bourgeoisie, proclaiming new democratic values, it attacked the imperialists but at the same time allied itself with the old feudal order and institutions and explained such alliance as concentrating fire on the foreign enemy first. In Maharashtra and elsewhere its opposition to anti-money-lender Bills was part of the class alliance and not just caste alliance. It defended the peasant only against government exactions and attacked land-tax and other measures, but till very late in the day it refused to maintain agrarian relations in its programme. Though subsequent generations of national leaders could not maintain exactly the same position and had to manoeuvre both against caste discontent and land-relations, their position essentially remained the same.

In 1920 the Congress expressed its partiality for the big landlords openly and chided the peasants for withholding the oppressive rent of the landlords. The February 12, 1922 Bardoli decision calling off the national campaign against British imperialism contained the following clauses. "The Working Committee advises Congress workers and organisations to inform the ryots that withholding of rent payments to zamindars is contrary to the Congress resolutions and injurious to the best interests of the country. The Working Committee assures the zamindars that the Congress movement is in no way interested to attack their legal rights, and that even when the ryots have grievances, the Committee decides that redress be sought by mutual consultation and arbitration". This was said at a time when huge peasant masses had started moving against the landlords in the United Provinces and elsewhere.

This crude defence of landlords was not repealed in the succeeding years when the peasant masses had to be appealed to by the leaders of the Congress. The Congress began to talk about doing justice to the tenants, etc, but the opposition to agrarian resolution, continued and the alliance with landlords remained. It was not for nothing that Gandhi once described the Princely States as "Indian India' and paid tributes to them and for years the Congress opposed widespread struggles in the Princely States.

This fear of agrarian revolution and alliance with indigenous obscurantist forces was not fortuitous. The weak industrial bourgeoisie without the confidence of meeting the challenge of imperialism had to rely on the established propertied classes from which also came a section of the intelligentsia. Besides in the twentieth century, in the decline of capitalism the bourgeoisie was unable to play a resolutely anti-feudal role. This was noted by Marxists. In fact Lenin, noting this development, declared that the democratic revolution in Russia could be led only by the working class and working class hegemony was essential for its success. Succeeding revolutions have shown that only under the leadership of the working class anti-imperialist revolutions including the agrarian revolution has been carried out, opening the way to socialism. China, Korea, Viet Nam are the recent instances. When the agrarian revolution could not be carried out, the anti-imperialist revolution got aborted, leading in some countries to fascism as in Indonesia. In the majority of underdeveloped countries where the bourgeois retained the hegemony, and sabotaged the agrarian revolution, pre-capitalist ideologies and

relations continued, leading to the overthrow of democracy. Pan Islamism, Islamic Republic, 'Guided Democracy' and many other reactionary feudal ideologies continue to dominate the minds of the people today because the soil from which they spring — the pre-capitalist or tribal relations — continues to remain fertile. Social reformers have not understood this link between the agrarian revolution in India and the retention of caste and communal inequalities, outlook and prejudices. For them casteism and communalism were just injustices unlinked with any production relation system, a prejudice to be removed by denouncing it, by asking those who practise it to reject it, and nothing more. The struggle was not to be linked with the present day social system — its pre-capitalist and capitalist basis, its source of class exploitation. It was not to be conducted as part of the general democratic movement or modern class struggle.

The Communist Party

The Communist Party was the only party which linked the struggle against untouchability and caste-system with agrarian revolution and end to imperialist domination. It alone saw in agrarian revolution and class struggle the key to overcome Hindu-Muslim separateness in practice The Platform of Action of the CPI, 1930, said:

> As a result of the rule of British imperialism in our country, there are still in existence millions of slaves, and tens of millions of socially outcaste working pariahs, who are deprived of all rights. British rule, the system of landlordism, the reactionary caste system, religious deception and all the slave and serf traditions of the past throttle the Indian people and stand in the way of its emancipation. They have led to the result that in India, in the twentieth century, there are still pariahs who have no right to meet with their fellowmen, drink from common wells, study in common schools, etc.
>
> Instead of putting an end once for all to this shameful blot on the Indian people, Gandhi and other Congress leaders call for the maintenance of the caste system which is the basis of and justification for the existence of that socially outcaste pariahs. Only the ruthless abolition of the caste system in its reformed, Gandhist variety, only the agrarian revolution and violent overthrow of British rule, will lead to the social, economic, cultural and legal emancipation of the working pariahs and slaves. The CP of India calls upon all the pariahs to join in the united revolutionary front — with all the workers of the country against British rule and landlordism.
>
> The CP of India calls on all the pariahs not to give in to the tricks of British and reactionary agents who try to split and set one against the other the toilers of our country.
>
> The CP of India fights for the complete abolition of slavery, the caste system and the caste inequality in all its forms (social, cultural etc). The CP of India fights for the complete and absolute equality of the working pariahs and all the toilers of our country.

The Communists knew that in a colonial country the slow process of industrial development does not lead so much to the proletarianisation of the peasantry as to its pauperisation. Even those driven into the urban factories do not lose their rural stamp easily — as in the earlier years they retained their connection with the land and retired to the village two months in a year. Besides their ranks being daily increased with arrivals from rural areas the formation of a firm class ideology was being repeatedly distorted. It was obvious that the blow had to be given in the rural areas to the pre-capitalist land relations.

> Owing to the interference of imperialism ... the drawing of the village into the sphere of monetary and trading economy is accompanied here by a process of pauperisation of the peasantry... On the other hand the delayed industrial development in the colonies has put sharp limits to the process of proletarianisation Capitalism, which has included that colonial village into its system of taxation and trade apparatus and which has converted pre-capitalist relations (for instance the destruction of the village commonness) does not thereby liberate the peasants from the yoke of pre-capitalist forces of bondage and exploitation, but only gives the latter motenary expression ... to the 'assistance' of the peasants in their miserable positions (e.g, in some localities of India and China) even creating a hereditary slavery based on their indebtedness.[4]

The CPI(M)'s memorandum on National Integration submitted in 1968 stated:

> Recently, Parliament and the whole country were rightly indignant with the ghastly burning alive of a Harijan farm-servant in open daylight in Kanchikacharla village in Andhra Pradesh. The press has been giving numerous incidents of atrocities that are being perpetrated on Scheduled Castes and Scheduled Tribes and on other backward communities. This phenomenon is not just some stray incidents confined to some particular areas or to particular states. It is a common practice, throughout the country — the legacy of the practice of untouchability and social oppression and brutality that persists in our rural areas, even after 20 years of indepenence and in spite of our laws and commissions for Scheduled Castes and Tribes! It is the result of the growth of feudal and semi-feudal landlordism and of the 'new rich' on the same feudal caste and social basis, and of their grip over the village economy and life! It is a reflection of the failure of the government to liquidate the medieval feudal economic base, of its failure to abolish landlordism, give land to the tiller and assure him land and employment, fair wages, and decent living conditions (house sites, education and medical services). It is a reflection of the growing domination of the village landlord vested interests, through the policies pursued by the Congress government in the name of community development, Panchayat Raj, Co-operatives, etc, all with the laudable objective of amelioration of rural masses, but which are designed to strengthen the old feudal and semi-feudal landlords developing into a new rich and their domination over the village life. The whole state machinery, and especially the police and courts, are turned to serve this purpose. Hence no wonder these *atrocities are increasing and a terrible* brutalisation of village life, negating all human values and decencies, is taking place. We need not be taken by surprise if these unfortunates, their patience exhausted, resort to desperate methods and caste riots break out on a large scale in the rural areas, which are already looming on the distant horizon. We will be having caste or race riots along with the present communal and language riots. It is only if the minimum economic living conditions are guaranteed, land and employment and social equality assured by eliminating the domination of the old-feudal and semi-feudal as well as of the new rich, this danger can be avoided. The democratic opinion and forces must assert and force the government to give up its present policy of using the state machinery in support of the village oppressor against the rural poor, against the Harijans and backward communities but use it, use its full strength, against the vested interests and bring about radical economic and social transformation in the rural side of our country.[5]

It will be seen that the Communists did not say that caste, untouchability or communal outlook would disappear without a revolutionary struggle against the antiquated land system and British rule; or that the struggle to eradicate the caste system can be fought in isola-

tion from the class struggle in the villages and the cities, by mere denunciation of the system. They knew that this class struggle was of a people who were not yet free from caste prejudices and who therefore had to be united in the course of the struggle to discover their common identity as exploited. Real and abiding unity was to be achieved during the course of the revolutionary struggle which is fought with no holds barred.

The Communists also saw that caste disintegration was taking place rapidly; in each caste differentiation was taking place between the haves and have-nots and that the process of pauperisation was affecting all castes. Almost all peasant castes have been the victims of this process. Thus a new common bond was being created between the lower sections of all castes — a bond which had to be stressed and consolidated during the course of the common struggle. It was therefore necessary to stress this common bond while fighting against caste inequalities. Here there is no question of replacing caste by class, refusing to recognise the caste distinctions and recognising only the class distinctions. It is a question of addressing yourself to the concrete reality which combined the growing formation of an exploited class with the existence of caste distinctions — the formation process of the class. Those who did not understand this double process landed themselves into reformism.

National Unity and Caste

The expansion of the national movement inevitably led to certain changes regarding the approach to caste and communal problems. In order to forge the minimum necessary unity behind it the national bourgeois leadership had to give up its former no-change outlook in regard to caste and inequality. The necessity of appealing to the peasantry and the rural masses composed of diverse castes of the lower order faced the bourgeois intelligentsia to take a more flexible outlook towards this question, and make it consistent with the democratic claims they were putting on behalf of the people. Equality of castes was preached without its abolition. Both the problems of caste in general and untouchability in particular had to be tackled by the national leadership. In consonance with its outlook of compromise with feudal land relations the bourgeois leadership adopted a policy, which though differing in words from the earlier policy, in content remained the same. Untouchability was declared a sin by Gandhi.

> To remove untouchability is a penance that caste Hindus owe to Hinduism and to themselves. The purification required is not of 'untouchables' but of the so-called superior castes. There is no vice that is special to the untouchables, not even dirt and insanitation. It is our arrogance which blinds us, superior Hindus, to our own blemishes and which magnifies those of our downtrodden brethren whom we have suppressed and keep under suppression. And I would be content to be torn to pieces rather than disown the suppressed classes. Hindus will certainly never deserve freedom, not get it if they allow their noble religion to be disfigured by the retention of the taint of untouchability. As I love Hinduism dearer than life itself the taint has become for me an intolerable burden. Let us not deny God by denying to a fifth of our race, the right of association on an equal footing.[6]

This passionate protest leaves nothing unsaid. But the equally passionate desire to keep the landlords and Hindu religion intact reduces the protest to a formal declaration only.

Unable to think of a basic liquidation of land relations the national bourgeoisie adopted social reforms as their watchword in the struggle for national unity. Education, social mixing, intercaste dinners, statement in public meetings that 'We are Indians first and last — beyond this the class alliance of the bourgeois leaders did not permit the national movement to go.

It will be seen here that the interests of the bourgeois class operated against the unleashing of a struggle against casteism. The outlook and compromise was strengthened because almost all leaders came from the better-off castes How is it, that despite these limitations, this blatantly reactionary class policy the Congress succeeded in getting the masses and forcing the British to retreat? How is it that the vast numbers from the peasantry, consisting of diverse lower castes, joined the Congress? The appeal of nationalism and anti-imperialism attracted the peasant who found no difficulty in identifying his misery with foreign rule. This was the new class reality — the unity forged by imperialist exploitation — which the Congress fully utilised, and those who pitted themselves against it were inevitably routed. The grafting of modern imperialist exploitation on the old feudal relations led to the emergence of a sense of national unity in the midst of a hierarchical caste structure.

The Imperialists

The British imperialists were not keeping quiet when the Congress leaders were making a bid to unite the diverse castes and communities under the national umbrella. The British countered the plan of the national bourgeoisie by offering separate electorates, reservation of jobs in government services, and educational facilities to the Muslims, backward classes and untouchables. Their aim was to raise hopes of advance in backward communities, to wean them away from the common struggle, split popular resistance and perpetuate separate caste and communal consciousness. The prevalent caste inequality, the monstrous oppression of the untouchables at the hands of the Hindus, and the communal barriers between Hindus and Muslims enabled them to play this game.

But the imperialists could not play this game for ever. They themselves firmly stood by the existing land relations, and therefore were unable to bring about any real change in the status of the untouchables or other downtrodden castes. Ambedkar himself had to warn:

> I am afraid that the British chose to advocate unfortunate conditions not with the object of removing them, but only because such a concern serves well as an excuse for retarding the political progress of India. So far as you are concerned, the British government has accepted the arrangement as it found them and has preserved them faithfully in the manner of the Chinese tailor who, when given an old coat as a pattern, produced with pride an exact replica, rents, patches and all... Nobody can remove your grievances as well as you can and you cannot remove them unless you get political power in your hands. No share of this political power can come to you so long as the British government remains as it is. It is only in a Swaraj Constitution that you stand of getting any political power into your own hands without which you cannot bring salvation to your people.[7]

It will be seen that three powerful class interests, the imperialists, the landlords and the bourgeois leadership, were acting as the defenders of the caste-system by protecting the landlords and pre-capitalist land relations.

Post-Independence Compromise

The story continues after independence. The use of the administrative

apparatus to offer a few concessions to the untouchables and others to raise illusory hopes is now continued by the new ruling classes. The Constitution has declared equality of all before the law, irrespective of caste; Parliament has declared untouchability a penal offence. But the basic structure of land relations overhauling of which would have given a blow to untouchability and caste-system, has not been changed. The new rulers therefore resort to the same subterfuges which the British had resorted to — reservation of jobs, reservation of seats in colleges, reservation of higher posts in government services, etc.

The land reforms Acts of the bourgeois landlord governments were intended only to adjust old relations to their immediate needs. Statutory landlordism was abolished but the basic structure and inequality has remained. And the Acts that were passed have also not been implemented with the surplus land legislation ending in a huge farce and land concentration increasing after the Congress enactments.

Once again the full weight of the administration and class rule supports the economic structure which keeps the castes and untouchability in being. The bourgeois landlord alliance which dominates the State is incapable of doing anything else, whatever may be its pretentious claims. The miserable results of the much advertised 20–Points Programme again prove the same truth.

In this situation it is but inevitable that the masses themselves should be victims of customs, the toilers should get divided on caste-basis and forget their common bond which is being daily created. It only means that the formation of a new class of proletarians is being delayed by the retention of land system and therefore the hold of earlier hierachical ideology continues. The dominant class interests have after independence worked for the retention of caste inequality, untouchability and communal outlook.

The Anti-Caste Current

What happened to the other current which launched a direct attack on the equality of the caste system, in some places even before the advent of the Congress? Why did all these protest movements which courageously condemned the monstrous caste system produce such pitiful results? The non-Brahmin movement which at one time appeared to sweep certain parts of the country has hardly succeeded anywhere in giving quietus to the caste system. The great struggles of the untouchables notwithstanding the fact that they were led by such an outstanding leader like Ambedkar, have failed to produce the desired result of abolition of untouchability. Atrocities against the untouchables continue. Neither these struggles nor the short cut of conversion to Buddhism have solved the problem. It is a great irony that the leaders of the neo-Buddhists have had to again demand that they should be treated as Scheduled Castes in the matter of reservation of seats, etc.

The so-called lower orders or castes of Hindu society actually form the majority; then why has not the majority succeeded in removing the stigma of caste-inequality and defeat the conspiracy of a few Brahmins or upper castes? The reality is that the poison of caste division has deeply infected its victims — the masses and the lower order who further are divided into several castes and sub-castes. Each recognises the injustice done to it but is not ready to remedy the injustice done to others by its own superior status. In Maharashtra you find that though the non-Brahmin movement was supposed to include all the lower orders and castes, in reality the untouchables were left to themselves. At one time Ambedkar had to say that the Marathas were bigger oppressors of the untouchables than the Brahmins.

In fact the National bourgeois leadership of the Congress could get away with its compromising policy on caste and revivalist appeal just because it could go down well among the masses.

The anti-caste leaders of the earlier days were totally different from the Congress leaders in this respect. It was inevitable that along with the rise of anti-imperialist national consciousness there should rise the democratic current attacking caste system and untouchability. The two were parts of the same process — the process of formation of a new nation in the midst of an ocean of pre-capitalist relations.

In attacking the inequalities of the caste system and caste consciousness the anti-caste non–Brahmin leaders were attacking the ideology and the superstrutcure of the earlier feudal age. The ideology and consciousness had to be attacked and the superstructure had to be exposed and undermined, if society were to change. It can be nobody's argument — let the economic situation gradually change, let new economic realities and new classes emerge and the caste-system and caste-consciousness will automatically be eliminated.

A reactionary ideology if not fought becomes an obstacle in the way of democratic and social advance, in the way of changing the economic reality. It acts as a brake on change. In India caste domination and caste-consciousness was acting as a brake and preventing the revolutionary unity of the masses. The earlier anti-caste leaders therefore did a splendid job in launching an attack against the caste system. This was all the more so because their nationalist contemporaries, coming from the upper castes, representing another section of the bourgeois intelligentsia, had not yet freed themselves from upper caste consciousness, and some of them, like Tilak, were strong defenders of the system. Tilak, it must be remembered, not only opposed the age of Consent Bill but a proposal for compulsory primary education also. It has already been pointed out that at the basis of this defence and, later on, compromise with the caste system lay the intelligentsia's compromise and alliance with the feudal relations. It will not be amiss in this context to treat in brief the evolution of the anti-caste movement in Maharashtra to understand the limitations and results produced by it.

Jyotiba's Movement

The origin of anti-caste movement in Maharashtra is associated with the giant figure of Jyotiba Phule: Jyotiba the great secular democrat, the friend of the poor and oppressed castes never wavered in his loyalty to the downtrodden in giving priority to their interests. Whether it was widow remarriage, education, liquor shops, caste exploitation, bureaucratic oppression or usury and land alienation, the economic loot of India, the building of a new market or decorations to greet a Viceroy at the expense of the people, or a dinner to a royal visitor, he defended the interests of the masses without prevarication and fears. His passion for the untouchables was unheard of and his sense of justice included every oppressed caste and he had absolutely no caste bias. He also demanded equal treatment for Muslims and Christians. No wonder the movement was originally named only as the *satyashadhak* movement — a movement against the untruth, injustice and hypocrisy of the Hindu social order dominated by Brahmin supremacy. He

carried on a crusade against the Brahmins and their ideology

A movement for equality, against caste-domination, was bound to have an anti-Brahmin edge at the time, the Brahmins being the supreme caste in the Hindu hierachy Certain other factors added to the situation Jyotiba's generation could not forget the nightmare of Peshwa rule under Bajirao II Keer, the biographer of Jyotiba, quotes *Loukahitwadi* on the conditions under Bajirao II as follows "If the farmers failed to pay him the desired amount even during a drought or famine he poured over their children boiling oil from the frying pan, flogging was perfected on their stooping backs, and then heads were bent over suffocating smoke Gunpowder was blown on their naval and ears". *Loukahitwadi* is again quoted as saying that when Bajirao was deposed by the British, women rejoiced and said "We are happy that there is now no more the rule of Bajirao The scoundrel has met the fate he deserved" The second factor was that despite the loss of political power, the Brahmins continued to dominate Hindu society treating the non-Brahmins as inferior beings Finally, the new intelligentsia under the British came mostly from the advanced Brahmin community, occupying strategic positions as officials professors, lower bureaucrats, writers and editors, creating the fear of the return of the old nightmare

Though Jyotiba inevitably directed the fire of his righteous indignation at the Brahmins, his vision was not a narrow sectarian one, but consistently democratic That is why he was the most uncompromising opponent of Brahminism. There could be no compromise between him and his opponents for he did not seek a place for any particular community in the Hindu hierarchy.

Jyotiba was part of the new intelligentsia. The intelligentsia and democratic trends were not arising only among the upper castes Down below also there was ferment Jyotiba represented the plebeian current — plebeian because he came straight from the lower order of Hindu society to which the peasant belonged. His political understanding was the same as that of the other sections of the intelligentsia. Where he sharply differed from the other sections was his uncompromising war on the Hindu social structure. *His championship of untouchables, his ruthless attack on Brahman domination, his exposure of the origin of castes, the Aryan doctrine, his demand for complete equality, his demand that Muslims and Chris- his demand for complete equality, his demand for education for the lowest, and his insistence on equality between men and women, constituted a thorough declaration of war on the old hierarchical order* This was a far more radical programme for equality and unity than the Lucknow Hindu Muslim Pact or the Gandhian National Unity Programme *Although the originator of the programme did not realise it, it could be achieved only by a revolutionary liquidation of the feudal land relations in India and colonial rule* He considered that the main instruments of realising the programme were the spread of education and enlightenment, the anti-caste consciousness and the fight against Brahmin domination and against the upper caste monopoly of advance under the British rule It was not accidental that the later day non-Brahmin leaders lost their fervour for the programme because further advance was possible only by attacking the land monopoly of the dominant castes and classes in the villages which included non-Brahmins also

Ideologically Jyotiba's programme was a consistent application of democratic values to Hindu society In other words, it was an uncompromising attack on the ancient and feudal superstructure based on feudal land relations Here was the big contrast between the upper-caste intelligentsia and Jyotiba — the former allied itself with indigenous reaction and its feudal base and superstructure while attacking the British the latter took an uncompromising stand against the superstructure and demanded its demolition In somewhat more favourable circumstances this would have led the latter to challenge the basic agrarian relations

Opportunism in Anti-Caste Movement

With the passing away of Jyotiba the movement lost its all-embracing character which was highlighted by the fact that it was now headed by the Maharaja of Kolhapur, a feudal prince His demand that he should be treated as a Kshatriya marked a new compromising stage of the movement Jyotiba died in 1896, and within ten years of his passing away the new leader started fighting for Vedokta rights (to be recognised as Kshatriya) for the Marathas and in another two decades the movement had turned full circle — only the Brahmins were to be replaced by the Kshatriyas. A new opportunism to seek a favourable place for his own community, especially the Maratha community, in the Hindu hierarchy and later on in the struggle for office and patronage under the British rule, now overwhelmed the movement [8]

With this change in outlook anti-Brahmin oratory became merely anti-Brahmin and did not represent anti-Brahminism It represented more an effort to secure positions in the new society for the new intelligentsia rising from the lower order This led to relying on the British for the anti-Brahmin struggle In reality this led to the non Brahmin leadership ranging itself against the first wave of anti-imperialist resistance of the 1920s The result was that when huge numbers in cities and villages were boiling with indignation over the Jallianwalla Bagh massacre, when the working class of Bombay was engaged in angry demonstrations against the visit of the Prince of Wales, the Maharaja of Kolhapur succeeded in drawing a large number of peasants to Poona to greet the British Prince of Wales, who was given the honour of laying the foundation stone of the Shivaji Memorial

But, obviously, this divorcement from the anti-imperialist struggle could not last long There was enough vitality in the movement to overcome this degradation, the more so that it was linked with the peasant mass and the peasant mass of India after 1920 was a different one from that in the previous years By 1930, when the new Congress movement began to reach the peasantry, the radical and fighting elements in the non Brahmin movement overcame their separation from the national movement, joined it, and the movement merged in the Congress

But though this was far better than waiting on the British, or remaining in opposition to the national movement led by the Congress, this was certainly not a fitting sequel to the all-round rebellion which Jyotiba tried to unleash His programme of a total annihilation of the Hindu hierarchical system could have been carried out only by combining it with a programme for the destruction of feudal and semi-feudal relations and for political power in the hands of the democratic masses, in short, a programme for the completion of the democratic revolution. Neither

the compromising leadership of the Congress, nor the new patriotic leadership of the non-Brahmin movement was capable of this, because both belonged to the same class. The result was a retreat on all fronts, helping the bourgeois leaders to gather the masses behind them. The hope of an independent revolutionary mobilisation of the people raised by the pioneer disappeared. A movement which could have independently mobilised the peasantry for a revolutionary onslaught went under the leadership of the bourgeoisie.

Landed Interests Again

What were the reasons for the non-Brahmin movement merging with the Congress? There were two reasons. One, the leadership connected with the peasantry felt the anti-imperialist national urge. It had to give up its earlier isolation from the national struggle with the peasant masses participating in it. Secondly, the movement could have struck on independent path only if it had dared attack the basic pre-capitalist land relations, the source of peasant exploitation and caste inequality. Like the Congress intelligentsia the non-Brahmin intelligentsia was not prepared to do it.

Here, the caste-distinction disappears The intelligentsia nurtured among the non-Brahmins, the product of Western education and bourgeois conditions, gives exact weight, acts as a compromising bourgeois intelligentsia, gives up the pioneer's uncompromising principles, merges inside the Congress later on to head its ministries, suppresses the people and keeps the castes in existence. Once again we see that whatever may be one's anti-caste pretensions, the bourgeois class outlook with its compromise with land interests vetoes any radical reform or eliminations. Post-independence experience shows that the ministries composed of mostly of non-Brahmin intelligentsia with a sprinking of untouchable leaders have kept the earlier Congress traditions and hardly done anything in the way of eradication of the caste system. The oppression, especially of the untouchables, is not less in Maharashtra and elsewhere.

When the anti-caste movement gets divorced from agrarian revolution, when it further gets divorced from the anti-imperialist movement, what happens to it can be seen from the life of the great anti-caste warrior, Periyar E V Ramaswamy.

Ramaswamy was first connected with the Congress and campaigned for independence. But he turned with revulsion against the Congress because of the caste prejudices of the leadership. Having lost his contact with the anti-imperialist struggle, he strayed far away from it, only momentarily coming to the fight against the agrarian relations and again relapsing into alliances and ways which were not to lead to the desired goal. In his review of Marguerite Ross Barnett's "The Politics of Cultural Nationalism in South India", N Ram sums up Periyar's quest for caste abolition as follows :

> As a youth boldly violating caste-based rules of social behaviour; as a young man who sought and failed to find the personal and social answers he was looking for in sanyasihood and religion; as an ardent Congressman who campaigned wholeheartedly for independence and social reform and spent a personal fortune as part of his commitment to the freedom movement and to social reform; as a Congressman alienated by the high-caste prejudice and social obscurantism of the Congress upholding the banner of social reform and, following a visit to the Soviet Union, Campaigning with short-lived enthusiasm in support of communism and organising conference against landlordism; as a leader of the Self-Respect League falling, tragically, into the trap of collaboration with the anti-national Justice Party; as the leader and publicist of a separatist movement demanding Dravida Nadu and campaigning against northern domination and the imposition of Hindi; as the leader of a Justice Party completely discredited among the people; as the founder leader of the Dravida Kazhagam collaborating with British imperialism against the freedom movement; as a tragic figure railing against the transfer of power, characterising Independence Day as a 'Day of Mourning' and demanding 'freedom from Brahamin Raj'; as a supporter of the newly formed Dravida Munnetra Kazhagam and an enemy of the Congress Ministry headed by C Rajagopalachari; as a supporter of the 'Kamaraj Congress' seen as representing the interests of 'real Tamilians'; as a supporter of the DMK in power; as an idol-breaker who, towards the end of his long life, polemicised against and rejected the Tamil language and Tamil culture set up as idols; as a militant propagandist of social reform divorced from class analysis and from a scientific theory of economic and political change...[9]

Periyar did succeed in creating a great feeling against caste, and did raise his voice to overcome untouchability. But for obvious reasons the task could not be achieved. The latest evidence has been the cruel Villupuram riots in which several untouchables have been killed. It may be mentioned here that it was under the DMK government that the rapacious Thanjavoor landlords' agents set fire to Harijan agricultural workers' houses and burnt alive more than 70 women and children. Those charged with this gruesome mass murder were acquitted.

Ambedkar

The monstrous atrocities against the untouchables under the present and the previous regimes reveal how the old tyrannies and injustices operated after three decades of freedom. In the earlier years Ambedkar, the most outstanding and tireless fighter on behalf of the untouchables exposed the upper caste hypocricies, lambasted the Congress and later on demanded land and separate colonies for the untouchables. This of course could not have been achieved without an agrarian revolution. But the idea of land distribution to all the untouchables to escape serf dependence on other castes was a very correct idea. It at the same time could have been achieved only through the common struggle of all the landless.

Later on he asked his followers to embrace Buddhism to escape the injustices of the Hindu society. But the grim social reality based on iniquitous land relations did not change because of change over to Buddhism. The quest for love and samata has not succeeded as recent atrocities have shown. The tragedy of the situation has been that the intelligentsia springing from the most oppressed communities also could not ideologically look beyond formal declaration of equality, more jobs, reservation of seats, education facilities, etc. Smashing the present socio-economic system was not part of its consciousness. The fight against land relations which also meant common fight along with others, escaped them. The intelligentsia from these communities sooner or later accepted the framework of bourgeois democracy and satisfied itself with a general declaration of democratic rights without touching the present property relations in land and industry.

No one directed more concentrated fire against the Congress leaders and their hypocrisy than Ambedkar. And yet he was one of the main architects of the Indian Constitution hailed by the Congress till recently as the last word in democracy, and under which the untouchables' houses are burnt, their houses are pillaged, their wives raped and they are murdered. No wonder Ambedkar felt himself cheated.

The rise of [illegible] trade union movement and the Communist propaganda against caste and communalism had minimal effect under the circumstances. The kisan movement headed by the Communists has been weak and is weak today compared with the requirements of an agrarian revolution. The basis for smashing caste distinctions, for developing caste equality can arise only in the course of widest and intense struggles against the common oppressor. Such unity was achieved on a wide scale during the armed Telangana struggle when the Harijan agricultural workers and caste peasants fought together. The Communist insistence on agrarian revolution is at the same time directed to storm the basis and fortress of casteism.

The working class which was still largely connected with land could not completely act as a modern class. It has been in the stage of formation. Nevertheless it showed great capacity to organise itself as a class in its daily struggles with all castes and communities, participating in strike. The class instinct has repeatedly foiled attempts to organise trade unions on caste or communal lines. The Communist propaganda both against caste and communalism since the earlier years has helped in this class solidarity.

Reformist Influence

Nonetheless caste and communal distinctions remain and are capable of being exploited for reactionary purposes.

Apart from this the slow progress in cities and among the workers has other reasons. A substantial, even a major part of the working class has been under the ideological influence of national bourgeoisie and their supporters. In carrying out strikes and struggles they take particular care to conceal the class relations in society, the class character of the State and the government and reduce the joint struggles to sheer economism. This together with total absence of all reference to the conditions of the peasants and the downtrodden castes obstructs the release of the working class from caste influence.

However it has to be admitted that there has been a certain neglect in the ideological *struggles against caste* and communalism and the CPI(M) for its part has decided in its recent Plenum to resume a widespread struggle against feudal and semi-feudal ideologies. The common consciousness generated through the economic struggle cannot be pushed forward without such strug- [illegible] the ideological struggle is not only to be linked with the necessity of changing the present social order *in toto* including the land relations; it cannot be successful unless the socio-economic role of Hindu religion, and religion in general, is properly put before the working class. The question of eliminating the caste system can no longer be presented as a question of Hindu social reform and in isolation from the main struggle of our times — the struggle for agrarian revolution, the struggle for ending the domination of monopolies and imperialist exploitation, the struggle for a state of People's Democracy leading to socialism.

All variants which sought to fight the anti-caste struggle in isolation from the main class struggles of our times have failed and produced pitiful results. It has been again proved that the anti-*caste struggle* cannot be fought in isolation, that it must be fought as part of the contemporary democratic and class struggle. The caste inequality and injustice have become an integral part of all modern class injustices. To remove them requires the common struggle of all the exploited strata to whichever caste they belong.

Initially this may appear difficult because the untouchable who is supposed to join hands with the non-untouchable poor peasant often faces him as an attacker on behalf of the landlord or his caste. Herein comes the vital role of the kisan movement which must put together the untouchable, the agricultural worker, the poor peasant against the common exploiters, the landlords, etc. The caste barriers have to be broken in the course of the struggle aided by anti-caste propaganda and education of the peasantry.

New Situation

The three decades of independence and Congress rule have created a new situation which openly announces the intensification of class struggle in the countryside which the landlords and their henchmen, and the bourgeois-landlord government seek to convert into struggle between the castes.

The three decades of independence *have, under the capitalist* path, seen an extreme deepening of poverty and unemployment in rural and urban areas alike. Irrespective of their caste-status millions are being pauperised while land and capital gets concentrated in a few hands. After 30 years of Congress land reforms and mass evictions there the untouchables. "According to Reserve Bank Data the concentration ratio assets (mainly agricultural land) owned by rural households was 0.65 in 1960-61 and increased to 0.66 in 1971-72. The poorest 10 per cent of the rural households owned only 0.1 per cent and the richest 10 per cent owned more than half of total assets in 1971-72 as well as in 1961-62".[10] This concentration has meant mass evictions of peasants of all castes apart from the loss of land to the tribals and untouchables wherever they had land.

The process of robbing the small people of their means of production which is the hallmark of capitalist path is again throwing thousands on the streets. "Less than full employment of the rural labour force is attributable to the progressive displacement of craftsmen and artisans by competitive modern industry. Urban unemployment, likewise, concerns not only workers laid off by declining industries, new entrants to the labour force and migrant workers from the surrounding rural areas, but a whole mass of self-employed persons and casual workers in the 'informal sector' eking out a precarious livelihood.... Attempts have been made to measure the extent of poverty in India, and depending on the terms used, the 40-60 per cent of the population is below the minimum acceptable standard. According to recent estimates using norms of caloric consumption, the percentage of population below the poverty line in 1977-78 may be projected at 48 per cent in rural areas and 41 per cent in urban areas. The total number of the poor, so defined would be about 290 million."[11]

In reality the total number of poor is much above the estimated figure, as the estimate is based on an arbitrary definition of poverty line. And finally unemployment in cities and rural areas has already reached staggering dimensions. The registered unemployment in cities has exceeded 10 million while the total unemployment is estimated to have reached more than 40 million. (Official figures try to underplay the extent of unemployment, and the Planning document estimates it as 4 million of wholly unemployed persons *in 1973. Taking into consideration those* who find casual employment it estimates the figure at 18.6 million.)

The concentration of land and capital is taking at one end; the concentration of economic poverty and unemployment is taking place at another end. This is the class reality that has deve-

[illegible] rapidly during the last three decades.

Notwithstanding the existence of social discrimination etc the problem of castes and sub-castes of untouchables and toilers is now inextricably connected with the problem of general landlessness and joblessness — the problem of growing expropriation of all sections under the capitalist path. This reality could not be understood in the earlier years. It is now becoming too palpable to be ignored.

The redistribution of land, the break up of the land monopoly of the landlords — most of them from the upper castes — is the common need of all landless and jobless.

Lagging Consciousness

The consciousness of the sufferers is however lagging behind this reality. Instead of a common struggle it appears as if the caste-struggles are reaching a new crescendo, castes appear to be pitted against each other as never before, and civil strife seems to be the order of the day. Witness the agitations leading to sabotage, burning of vehicles, uprooting of railway lines following reservation of jobs for backward class in Bihar and UP. These protests from certain upper castes reached their climax during the Samastipur election when the bureaucracy almost exclusively recruited from the upper caste not only helped the Congress (I) candidate (upper caste) but threatened to arrest a minister of the Janata government.

Official policies are definitely contributing towards diverting the common struggle into caste conflicts — the bourgeois landlord way of serving its class rule. The competition for land, for job, for official concessions, for loans and educational opportunities has immensely intensified leading to easy diversion into casteist channels. The problems of backward castes, of reservation of jobs for untouchables and tribals, of reservation of promotions and eliminating the backlog in promotions, are leading to inner conflicts among the toilers, enabling the vested interests to split their unity as an oppressed class.

[illegible] the landed and monopolist [illegible] the bourgeois-landlord government [illegible] seeks to divert the challenge of [illegible] and poverty by offering [illegible] measures of relief to sections of [illegible] castes — reservation of [illegible] government services, seats in [illegible], facilities for education, talk of reservation of promotion.

In the very nature of things these palliatives will neither solve the problem of poverty and unemployment, nor change the condition of untouchables and other downtrodden castes. They will certainly offer some relief, to individuals from these communities, enhance their confidence in their advance, but not change their status. For the ruling classes these concessions play an important role. In the first place in the general competition for jobs etc, they pit one section of toilers against another. Secondly they create an impression among some sections that government is their real friend and they should confine the struggle within the framework of the bourgeois system. Thus a basic challenge to the present socio-economic system from the most downtrodden sections is prevented.

Fight the Socio-Economic System

It is obvious that in the present situation when untouchables and certain other sections are openly discriminated against, the democratic and working class movement cannot object to reservations of jobs and other concessions. They have to be supported to cement the unity of the toilers.

At the same time all sections of toilers from all castes have to be educated that these palliatives do not solve a single problem, they neither alleviate the conditions of the downtrodden sections nor solve their job problem. They only serve to divert attention from the main enemy — the landlord and monopolists. The common class struggle in the present favourable situation can be waged only if the working class, the democratic movement and the kisan sabhas carry on an incessant ideological propaganda against caste domination and actively intervene on the question of caste oppression.

The class struggle is already unleashing itself in the rural areas. A large number of the attacks on untouchables originate because they refuse to work as former serfs, want to work as modern labourers on settled conditions about their work. The mobility of labour, higher wages, freedom to move and cultivate the land — these form the content of a number of disputes leading to atrocities against the untouchables. They reveal the real economic basis behind untouchability. These struggles constitute and integral part of the peasants struggle and have to be fought unitedly.

The advanced trade union movement will have to discharge its responsibility in overcoming its weakness on this question. It is being faced with a new problem regarding promotions and arrears of promotion. [illegible] it keeping the spirit of class solidarity intact.

The new situation calls for giving up the tradition of fighting caste battles in isolation from other toilers. It was inevitable that in the earlier years the movement of the downtrodden castes should be conducted on the basis of caste vs caste. It was all the more inevitable in the case of the untouchables who were denied human existence. This tradition has led to an exclusiveness which refuses to consider that there are toiling sections in the other castes who have to be detached from their caste leadership and to be brought face to face with the common oppressor. The vested and opportunist interests in some downtrodden castes seek to keep their followers away from the common struggle so that they can continue to have their hold on them. All this must change, and without lowering the banner against caste oppression, every effort should be made by them to join the common struggle for democracy and social advance.

For it has to be realised that the present socio-economic system is based on property relations which sustain both caste and class oppression. It is sheer deception to think of abolishing untouchability or caste with the landlords and monopolists dominating the economy and bourgeois landlord government in power. The caste problem is inevitably merged with the problem of ending the rule of bourgeois landlord class and moving forward to socialism.

The Emerging Situation

A Socio-Structural Analysis

A R Kamat

This paper attempts to examine the emerging situation in India in its social-structural context and to relate it to the structural changes that have taken place in the post-Independence period as a whole and in its latter half in particular.

First, we take a sort of an historical overview of the situation in 1947, and then outline the shifts that have occurred since then in the relative positions and strengths of the various economic and socio-political forces.

Later, we analyse the manner in which they are now operating in the developing situation and discuss the important issues involved.

I

Introduction

IT is now a well-recognised fact of recent history that by the mid-sixties India entered a period of socio-economic and political crisis. The ruling classes tried to stave off the crisis by adopting populist slogans like *garibi hatao*, on the one hand, and by unleashing a ferocious offensive, on the other, against its immediate opponents, the communists in West Bengal, and the Naxalite leadership of the incipient agrarian revolt in North Bengal and elsewhere. With the accentuation of crisis conditions, the repressive regime culminated into a total authoritarian rule of the nineteen-month Emergency against all opposition

The post-Emergency rule of the Janata combination which assumed power in March 1977 removed some of the glaring political trappings of authoritarianism; but the 'permanent' emergency, the crisis situation in the country, continues. The developments of the last two years, well-documented in the columns of the *EPW*, show that in many respects we are again back in the uncertain period 1974-75; in other respects the situation has worsened and thrown up altogether new features with serious forebodings.

This is clear, first, from the large number of atrocities the dominant sections of society have perpetrated during this period. It looks as though various vested interests, emboldened by the presence of their supporters in the motley combination which goes by the name of Janata party, are having it out against the weaker sections of population, *viz*, the scheduled castes, tribals, landless labour, unorganised labour, and the religious minority. Very often this is done with the connivance of the state apparatus. The Marathwada holocaust and the Aligharh riots are some of the worst instances, and not only in terms of the calculated brutalities. They, together with the Kanjawala affair, have added an altogether new dimension, in that, the dominant sections of society are now putting forward demands to annul the special privileges and other concessions granted to the relatively deprived sections — such as scholarships, reservations of seats and grants of common fallow lands. The organised workers too are experiencing similar attacks — as in Kanpur last year — and the black Bill is already on the legislative anvil to deal a crippling blow to the entire trade union movement.

Portentous developments are taking place in the political field as well. Ambitious politicians are conjuring up, under the cover of organising the kisans in general, a solid phalange of rich peasants to buttress their political claims. And, overwhelmed by the massive turn-out, other leaders both in the ruling party and the opposition are looking askance or paying obeisance to the emerging oracle of the so-called peasant power. This has added to the already manifest political uncertainties where possibilities of destabilisation and re-alignment existed all along — not only within the ruling conglomerate and the major opposition parties, but also between them. Thus the ensuing period is pregnant with sharp conflicts and confrontations, and it portends widespread political turmoil and upheavals.

This paper attempts to examine the emerging situation in its social structural context and to relate it to the structural changes that have taken place in the post-Independence period as a whole and in its latter half in particular. First, we take a sort of an historical overview of the situation in 1947, and then outline the shifts that have occurred since then in the relative positions and strengths of the various economic and socio-political forces. Later, we analyse the manner in which they are now operating in the developing situation and discuss the important issues involved.

II

Structural Situation in 1947

This section starts by mentioning the broad structural profile at the time of the transfer of power in 1947 and its salient characteristics. The urban segment consisted of the industrial capitalists, merchants and traders, the educated upper and middle classes in services (mainly in the bureaucracy but also in the private sector) and professions, the industrial working class, the lower middle classes in services and small trade, artisans and other self-employed, and the urban poor (unorganised workers and others). The rural segment comprised the feudal interests (the princes, zamindars and big landlords), the peasantry (rich, medium and small), the traders, the money-lenders (very often the same persons combining trade and money-lending with feudal interests in land), the tenantry, the landless agricultural and other labour, and artisans. The princes, the big landowners, the zamindars, and their hangers-on often lived in cities but lived mainly on the surplus extracted from the largely pre-capitalist (feudal) economy.

It is not necessary to spell out obvious economic and social linkages expressed through economic relationships (exploitative or otherwise) and also through the caste hierarchy, between these various sections of the population in the town and countryside, and also within them. But it is helpful to remember some important aspects of this colonial social structure, a legacy of the British imperial rule.

First, Indian capital had acquired

[illegible] strength before and during the Second World War, and had already thrown up its leading section of big bourgeoisie. Second, trading capital, because of its close link- [illegible] with industrial capital on the one [illegible] and money-lending business on the other, was a power to reckon with among the capitalist interests. Third, for historical (dating both to pre-British and British period) reasons, the educated upper and middle classes had come to exercise a disproportionately large influence on the socio-economic, and particularly the socio-political situation. Fourth, because of the spread of irrigation and cash-crop economy, there had arisen a sizeable nucleus of rich peasants in the countryside which was beginning to contend for economic power and influence with the feudal interests, and for social status and political power with the upper stratum of the caste hierarchy in the rural areas. Finally, the industrial working class which was small but fairly organised could not be ignored in the urban set-up

It is also necessary to have a look at the social structure proper. In the pre-capitalist society of the pre-British period, the economic structure — with its stipulated division of labour (production relationships) and the hierarchical social structure (the caste structure) — had inextricably combined into a composite whole. It was only the mighty impact of British colonial capitalism which began the process of shaking it up, of extricating its two components. The socio-economic structure in 1947, described above, was a product of the impact of colonial capitalist rule on this pre-capitalist structure of Indian society. It is true that, by the middle of the nineteenth century, and particularly after the 1857 revolt, British capital in India had entered the imperialist phase and had shed whatever vestiges it had of progressive bourgeois liberalism in the earlier period. Thenceforward their avowed policy was to preserve the feudal interests as far as possible making them subservient to the interests [illegible] British capital. This also meant a [illegible] of neutrality and non-interven- [illegible] the religious and social re- [illegible]. The idea was to create [illegible] a strong social bulwark [illegible] continued rule and aggrandisement.

Even so, the growth of industry and trade, and the spread of English education, introduced far-reaching changes. They created many new occupational and job opportunities and induced considerable horizontal and vertical mobility in Indian society. These, together with the bourgeois rule of law (which at least in theory conceded *equality and freedom of the individual*), and the corresponding legal, political and administrative institutions which were planted here, appreciably eroded the rigidity and rigour of the old social structure — the hierarchical structure of caste society. A new social stratification based on education, income, and occupation, was gradually taking shape, *not so much in complete replacement of as in superposition on the old stratification, that is, within and across the caste structure.* By 1947, this change was clearly visible in the urban sector and had started to make its incipient impact on the rural areas.

Social elite groups, which came to the fore to share the modern economic advance and political power and thus to acquire a new status at the intermediate and lower levels under the new dispensation, belonged mostly to the upper strata of the old society, to the advanced caste groups. Naturally, the same groups were also the leading sections in the formation and maturation of the rival centre of allegiance, in opposition to British rule. They were the leading sections in the powerful movement for national freedom. But due to the factors and developments mentioned in the last para, during the thirties and forties of this century, there also emerged a small but sizeable educated section from the middle castes, the rural land-based castes, and a still smaller section from the lower strata of the lower castes including the scheduled castes. The former had not only started entering the services and professions, but with the militant sweep of the national movement they had become an important detachment in its fold. In short, the middle and lower strata in society were already knocking at the doors of the citadels of power to claim their rightful share in the shape of things to come (after Independence).

This was the situation at the time of the transfer of power in 1947, about which two more things need to be mentioned. First, because the transfer of power (along with the widespread riots, anarchy, displacements and untold human misery due to the partitioning of the country) had taken place in a non-revolutionary manner the new ruling elite, inherited the imperial state machine intact, including its powerful coercive apparatus and imperialist tradition of repressive rule. Second, the ruling elite which came to power and [illegible] [illegible]ected essentially the [illegible] of class forces and their relative strengths at the time. Those who shared power and wielded it represented the vested interests in the Indian socio-economic and political power structure: the Indian bourgeoisie (led by the monopolists), other upper and middle classes including its influential educated complement from the urban sector, and the feudal landed interests and the emerging class of rich peasantry from the rural sector. The stage was thus set for the developments of the post-1947 period.

III

Structural Changes since 1947

Let us now briefly review the structural developments of the post-1947 period. The economic programme which the independent Indian State adopted was the programme for the advancement of capitalism, controlled to serve its own interests, but interspersed with a few welfarish features going under the name of socialism or socialistic pattern, to propitiate the Left-oriented intelligentsia and the working class. This was in a sense a recognition of the powerful mass character of the freedom movement. In order to realise this objective of rapid capitalist development, two things were imperative. First, it was necessary to curb the feudal interests which was accomplished by abolishing the princely states, the big zamindars, and a section of intermediary (absentee) landlords. The anti-feudal policies were never meant to destroy feudal interests (for the fear of unleashing radical agrarian forces), but were meant to enfeeble them, and so help the advance of capitalism in industry and agriculture. Secondly, it needed massive State support and developmental planning to create the necessary infrastructure: a public sector of basic and heavy industries, large irrigation projects, rapid development of transport and communications, large-scale industrial finance facilities and co-operative and other government-financed institutions at the state, district, and lower levels.

The rapid industrial growth deepened and widened the basis of industrial capital, strengthened the trading capital, promoted small-scale ancillary industries, and resulted in a further concentration of capital. Big business in industry and trade have come to exercise a powerful hold over the economic and political life of the country. Such is their continued prosperity

throughout this period that, while on the one hand they have become vociferous demanding more and more concessions from the government, some of them even started to parade themselves as 'democratic socialists', (their only abhorrence being for the Marxian variety!)

In the rural areas, the state policies helped the capitalist advance in agriculture and the rise and consolidation of the rich peasants as a powerful class of rural vested interests. They combine with the (still quite powerful) feudal interests on the one hand, and the trading, moneylending, and agro-industrial interests (e g, sugar factories, etc) on the other — often the same set of persons participating in all these economic activities. They have thus emerged as a powerful small-town and rural lobby. The democratisation of politics, following the adoption of adult franchise and representative institutions at various levels, had already brought them by the mid-fifties to the seats of power at the state and lower levels in several states. By the sixties they acquired an effective political leverage at the Centre.

It is useful at this stage to note some consequences of the economic advance in post-1947 India which have socio-structural significance. First, the development of a modern industrial and business sector and its accompanying appurtenances has resulted in the creation of a class of highly qualified scientists, technologists, and management personnel and others, which we have elsewhere called the 'super elite' of the educated upper middle class. Second, the growth of industries, the expansion of business and trade, the multifarious developmental activities of the government, etc, resulted in a considerable rise in the tertiary or service sector, many and varied kinds of job opportunities for the new educated. Thus, along with the chief beneficiaries of the rapid economic advance (*viz*, industrial, finance and trading capital, their technical and managerial personnel, and the combination of semi-feudal interests and rich peasantry), the educated middle class could also have a share in the spoil. This blunted the edge of their erstwhile Leftward political orientation; even the Left political parties began to have illusions of a gradual advent of the 'socialist' millenium! Finally, the late fifties also witnessed the emergence of powerful organisation of the white-collar employed on the one hand, and an incipient labour aristocracy in the highly modernised industrial sector on the other.

This illusion of prosperity was, however, only superficial and, as we shall see, also short-lived. Already, by the beginning of the sixties, it was clear that all this economic advance had failed to meet the twin chronic problems of poverty and unemployment among the mass of common people. It was discovered that the distribution of income had in fact become even more skewed which meant that the benefits of the advance were largely appropriated by the thin stratum at the top of the pyramid.

By the mid-sixties, all pretensions to steady economic advance and well-being had to be given up because industrial advance had slowed down considerably. The advance in agriculture continued for some more years and, in fact, the so-called 'green revolution' in wheat occurred in the late sixties. This rural prosperity, however, benefited only a few at the top. Moreover, it resulted in polarisation of poverty and unemployment at the other extreme. Soon, the green revolution too tapered off. Thus began a period of stagnation and crisis, of rapidly rising prices, of increasing incidence of poverty and unemployment. For the first time since Independence, the spectre of unemployment began to seriously affect even the educated upper and lower middle classes By the 1967 general elections, it was clear that the Indian economy and polity had entered a critical phase. Indeed, that phase continues for all these years with or without Emergency. The 'permanent' emergency has become a fact of life with the large majority of common people.

Before concluding this section, it is useful to recapitulate the structural situation emerging from the developments of the post-1947 period. The basic framework had not altered in its essence from what it was in 1947 (described in Section II), but certain significant shifts had occurred in relative strengths and positions. The feudal intrests are enfeebled, but not destroyed and are still a powerful economic and political force particularly in backward states and regions. There has emerged a powerful class of rich peasants dominating the economic, political and social life of the countryside in close linkage and collaboration with the feudal interests on the one hand and industrial and trading bourgeoisie on the other. Political democratisation has enabled them to establish a decisive hold and control over the power structure at the state and lower levels and they can exercise enormous influence at the Centre. The Indian capitalists (industry and trade) are strengthened enormously; big business has further consolidated its monopolist position and is pursuing the dual policy of building its own independent strength as well as that of active collaboration with foreign capital for widening its domain of exploitation. Capitalism has deeply penetrated the rural areas, in agriculture, trade, and agro and other industries. This capitalist advance has also brought about the corresponding expansion and differentiation of the educated middle classes, among whom has crystallised a new super elite of highly qualified technocrats, management personnel, and top echelons of bureaucracy and defence services. The working class has also grown but is divided and has partly lost its organisational solidarity and militancy. The white-collar employees have strengthened their bargaining position and an incipient labour aristocracy appears to have emerged in the modern sector of industry.

In terms of the old social structure — the caste structure — the upper castes have lost much of their direct political leverage Yet, because of their entrenched positions, they wield considerable influence in the economy and administration and therefore indirectly in the political sphere The rise of rich peasantry has brought the middle social strata of society, the middle land-based castes, to leading positions in the rural economy and in state politics. Their leadership used its newly acquired political power and prestige to spread education in small towns and rural areas so that the middle social strata have now been enabled to enter the educated middle classes at various levels in considerable numbers. The spread of education has thrown up an educated class of a small but sizeable number also among the socially lower and even the lowest strata, the scheduled castes, tribes and other backward communities. They are as a result trying to assert their identity and claims for a rightful place in economy, polity and society.

To these must be added the increased polarisation in income distribution, the increased incidence of poverty and unemployment, and the consequent degradation in the quality of life of the overwhelmingly large population in many of the lower deciles. Thus the basic contradiction of the present period is, as before, and even more so

between the economically affluent and politically and socially powerful classes in the towns and the countryside and their henchmen on the one hand and the deprived and exploited sections on the other — *viz*, the large majority of working population, the industrial proletariat and the urban poor, the poor peasants, the agricultural proletariat and other rural poor, with the rest of the middle segments hovering between these two main contending formations.

IV

Towards an Understanding of Emerging Situation

Before we attempt an understanding of the emerging situation, let us examine the political developments of the latter half of the post 1947 period in the light of the shifts described above. As already mentioned, the economic crisis of the mid-sixties and the consequent popular discontent and agitations form a clear watershed in our recent history and has affected the political fortunes of various structural formations. By this time, Indian big business with its vast accumulated strength under government patronage had started throwing its weight about, demanding freer rein for itself at the expense of the public sector as well as for unfettered collaboration with foreign capital. The rich peasants had acquired enough economic and political strength to secure more favourable terms of trade in the form of guaranteed higher purchase prices for farm products and substantial subsidies on farm inputs. They also consolidated their political positions in the states and started behaving like *subedars* in the ruling Congress party and, where necessary, outside its fold.

The escalation in prices and increasing unemployment, which had now extended to even the higher educated youth, resulted in widespread discontent. This manifested itself in campus riots and language agitations, and chauvinistic regional movements such as the Shiv Sena. It is well known that the latter had a strong clandestine support of the big business and the ruling Congress in Bombay and was aimed at attacking the Leftist forces among the working class and middle classes. In spite of these divisive manoeuvres, there were massive working class struggles, culminating in the all-India railway strike of 1974. However, politically, the Left forces remained largely disunited and — except in two peripheral regions, West Bengal and Kerala — they were not in a position to give a head and lead to the popular discontent.

The happenings of the early seventies including widespread anti-Congress agitation led by Jaya Prakash Narain and the clamping of the Emergency rule are so fresh in memory that they need no elaboration here. What is necessary to mention is that, under cover of heady populist slogans, Indira Gandhi had actually appeased the Indian bourgeoisie by conceding their anti-labour and pro-foreign monopoly demands during the Emergency. In their own words, Indian big business had never had it so good. So good in fact that one of their great stalwarts, who had earlier sworn by democratic socialism, praised the authoritarian Emergency rule in most fulsome phrases (that, too, almost on the eve of the declaration of elections in January 1977!). The rich peasants' interests were also not touched by the Emergency rule except that the state satraps were disciplined to a certain extent to the Centre's policies and had to 'tolerate some minor irritants of the 20-point programme (e g, the sloganised abolition of bonded labour and distribution of surplus land).

This brings us to the present period and the emerging situation under the post-Emergency Janata rule at the Centre and in all the states (except West Bengal and Tripura under the CPI(M) rule, and Kerala under the CPI-led coalition rule). The economic (and also the political) crisis has assumed more serious proportions (in spite of the very comfortable position in food stocks and foreign exchange). In terms of poverty and unemployment, the present is an aggravated continuation of the past situation prior to and during the Emergency rule.

Due to changed correlation of forces, however, it is manifesting some altogether new features. These are examined in the following paragraphs.

The industrial and trading bourgeoisie have reasons to be satisfied with the policies of the Janata government: liberalisation of controls and imports as well as greater opportunities for multinational link-ups — of course, under the usual noise to the contrary, together with the proposed industrial relations bill with its clear anti-labour thrust. But capital needs something more for its unhindered industrial and business activities, *viz*, a unified stable government and administration, a minimum 'law and order' throughout the country which are becoming more and more scarce under the present dispensation. If and when it comes to the crunch they will not hesitate to back the authoritarian forces, as they did before, within or without the ruling conglomeration.

The rural vested interests, the feudal landlords, the rich peasantry, traders and others, are also happy because of the removal of controls and guaranteed ever-rising purchase prices of foodgrains and other farm products; the latest such rise, and quite substantial, was announced only a few months back, despite the government's own declaration that they had succeeded in holding the general price line including farm inputs. They are not only happy but are on the offensive as is clear from their aggressive postures in different parts of the country, the Kisan Sammelan of December last being its latest and strongest manifestation. Raising slogans of decentralised economy, greater concern for the rural economy, resistance to urban exploitation of the rural population, etc, the rich peasant leadership has spread its umbrella wide enough to cover all peasant and other rural elements. The idea is clearly to build a strong mass base which will enable it to contend for power in Central politics. In the nature of things, however, it cannot become a viable rival power centre unless it makes peace with the big bourgeoisie and continue to remain its junior partner. But it can certainly throw its weight about both in Central and state politics and mount offensives against its real or assumed opponents in small towns and the countryside and occasionally even in the metropolitan cities (e g, Kanjawala agitation and the Kisan Sammelan). They can certainly try and intimidate the poor and the deprived in the rural areas in order to keep them in a subservient position. In short, the rich peasant as a class has become fully conscious of his strength and is prepared to demonstrate and wield it in pursuance of the politics of power. However, this class cannot act as an all-India force for any continuous stretch of time.

The economic situation in general and the rural situation in particular needs a further and closer look. It has been mentioned above that, during the last decade, poverty and unemployment have become even more widespread. The number of unemployed are now more than two crores. A large number of them are landless agricultural labourers — many of them so due to the pauperisation of poor farmers. Moreover, a significant part of the unemployed are secondary educated, a few even college educated, who had

[illegible] to get lower-rank salaried employment in the non-farm secondary or tertiary sector.

In fact, the spread of education in small towns and rural areas bears further scrutiny; it has simultaneously resulted in several significant consequences. First, it has helped the middle castes, the landowning castes, to consolidate their economic and political power, and enabled their educated youth to enter the ranks of advanced-caste educated elite as well as of the middle and lower middle class literate jobs. Because of the slowing down of economic advance the further spread of education very often means further addition to the unemployed youth in small towns and the countryside. These late comers belong mainly to the lower middle castes, that is, backward but *savarna* castes. The spread of education has also produced a sizeable educated class among the scheduled castes and tribal youth with a new awareness and even militancy about their economic and social rights. The reservation of seats, scholarships and other educational privileges and also reservations in government jobs for the SC and the ST have consequently become an eyesore for the educating and educated youth from the middle and lower middle castes.

On the other hand, the spread of capitalism in rural areas has not only strengthened the rich peasantry belonging mostly to the middle social strata but has also meant further pauperisation and economic dependence of the landless, many of whom belong to the scheduled castes. The latter in their new political and social awareness, are trying to assert and organise themselves for a minimum wage and for the removal or at least mitigation of the grossest of social discrimination on the part of the caste Hindus. The rich peasantry not only regards this new awareness and assertiveness on the part of the SC and ST as a menace to their social position in society but more importantly as a menace to their exploitative interests. They had regarded them till now as a [illegible] source of cheap labour, ab[illegible] dependent on their favours both [illegible]cally and socially. Many of the [illegible] on the SC and ST during the last two years, including the recent Marathwada burnings, reflect this developing conflict between the land[illegible] interests on the one hand and the SC or tribal rural proletariat on the other. In its recent manifestations, the former can use economic, caste, educational and job-reservation factors to mobilise the middle and lower caste peasantry and even agricultural labour, as well as the active connivance of the sword arm of the State (*viz.* the police and other constabulary), to suppress the newly awakened scheduled caste toilers. The idea is 'to show them their traditional place' and to keep them there. And, in this, as mentioned in the beginning, they are emboldened by the presence of their rabid supporters in strategic positions in the political leadership which has assumed the reins of powers at the Centre and the states. The widespread Bihar conflicts between the 'middle' and 'backward' castes mobilisations over the last six months and more are bizarre manifestations of similar social structural factors.

Before we end this longish review of the structural shifts and the roles they play in the recent conflicts and confrontations it may be in order to mention briefly a few relevant issues. First, caste is a specific of pre-capitalist Indian (Hindu) society, which largely governed its total ethos during a historical period, and has carried itself through the colonial stage to the present. It has at all times served the dominant social strata in society as an instrument of economic exploitation, social discrimination and cultural oppression.

The Left intellectuals and political and social activists have, however, mostly avoided coming to grips with the problem, taking it into serious account both in social analysis and social action. (It is not our intention to discuss it further here.) But there is no doubt that in the recent conflicts caste is being used by the upper and middle strata of society not merely as an instrument of social discrimination but as a weapon of economic aggrandisement.

It should be remembered that the *rural rich and the elite themselves who* are using it against the scheduled castes (and other lower or backward castes) are no longer steeped in traditional obscurantism. They have embraced considerable modernisation for their economic advance. The double-edged use of caste has therefore lessons both for those who are devoting their efforts mainly to social reform movement and social enlightenment (*Prabodhan*) as well as for those who are participating in actions for a radical socio-economic transformation or both.

Secondly, the progressive movement will have to take a firm stand that the present special privileges to the SC and ST must not be discontinued or whittled down. The concessions to economically backward sections in order to cover other backward [illegible] may be introduced in addition to, and not in replacement of, the existing facilities for the SC and ST. Moreover, they should also guard themselves against advocating additional privileges on purely caste basis as that in Bihar. The latter will only open a Pandora's box and divide rather than unite the poor and deprived.

Finally, it will be facile and foolish to entertain the illusion that the fast-spreading economic crisis will automatically usher in a corresponding strength to the progressive democratic forces desiring to mobilise the common people for revolutionary restructuring of society. There are instances of societies writhing under stagnation, chaos, internecine conflicts among the working people, and overt or covert authoritarian rule for several decades together, without achieving a breakthrough.

In India, at the present stage the Left and progressive forces are weak and divided except in certain geographical pockets. They have not been able to establish a rival all-India centre of political allegiance. This can only be accomplished by building and strengthening in the first instance the economic and political organisations of the industrial working class and other proletariat in the cities and the poor peasantry and the agricultural and other rural proletariat. The experience of the last few years in the rural areas shows convincingly that it is relatively less difficult to mobilise the scheduled caste and tribal working people due to their social homogeneity. At the same time, the Left progressive movement has also to acquire further strength and influence, and succeed in creating a politically conscious base among the middle sections: economically speaking, the middle and lower middle classes in the cities, the middle peasantry in the countryside, and socially speaking, the bulk of the middle and the lower middle sections of caste society.

This latter will, however, depend much on the success in the primary mobilisation mentioned earlier. If the progressive Left fails to unite on these issues, fails to carry out these historical tasks, *the only alternative before* the country is that of a long barren period of large-scale economic, political and social turmoil and upheavals of which the happenings of the last two years are initial symptoms.

[Footnotes are dispensed with for the reason that the option was between a very large number of them or none. The author has opted for the latter at the risk of making the paper lack a learned appearance.]

The Emergence of the Poor as a Class

P C Joshi

The revolutionary potential of poverty would be obscured if the question of rich vs poor is misrepresented as a question of town vs the village or of caste vs caste. It is idle to think that poverty in the rural areas can be fought without the support of the urban poor and that rural development can be achieved without the support of urban industrial development. Posing the question of poverty as one of town vs village, or of caste vs caste, therefore, ultimately helps in perpetuating system-generated poverty; and 'ruralism' and 'casteism' in the Indian context perform the ideological function of a mystifying force, keeping the poor in darkness about the social genesis of poverty and thus thwarting their emergence as a socially conscious force.

THE social situation in many Asian countries including India is marked by a great paradox. While the question of poverty has acquired political importance and legitimacy, the poor themselves are still far from becoming fully articulate and from emerging as a social force, i e, as an agent of social change. There is still a vast hiatus between politicisation of the issue of poverty and the politicisation of the poor The issue of mass poverty is frequently used by one section of the ruling class for the indictment of the other sections without the poor themselves being mobilised to protest or revolt against their own deprivation.

I

What explains this lag between the vast mobilising potential of poverty and the lack of realisation of this potential for social and political change? What explains the emergence of the politics of poverty as an issue of power struggle within the ruling elite without the involvement of the poor themselves in the struggle against the forces perpetuating the socio-economic basis of poverty? One must first seek reasons for it in the contradictions of contemporary politics itself as reflected in the *concern* of the ruling elite for poverty and its *distance* from the poor. As a result the issue of poverty is put into the centre of politics but the poor are not put at the centre of the political stage Moreover, the spontaneous protests of the poor against their deprivation do not find adequate response from those who control the mass media (press, radio, TV films etc) or from those who dominate the political system (parliament, legislatures, political parties executive, judiciary and bureaucracy) Such a situation reminds one of the very perceptive observation made by Karl Marx in "The Eighteenth Brumaire of Louis Bonaparte": "The bourgeoisie, to be sure, is bound to fear the stupidity of the masses as long as they remain conservative and the insight of the masses as soon as they become revolutionary".

Concern for poverty but distance from the poor is not only a marked characteristic of politics in countries like India. It is also a marked characteristic of journalism, literature and social science. Take journalism first which in western countries played a very important role in awakening social sensitiveness to the existence of the two nations, the rich and the poor, and which aroused social conscience in regard to the wide chasm between the two. The emergence of a social policy on poverty owes very much to the exposure of poverty by the press on a wide scale. In India itself in the pre-independence period newspapers played a very important role in bringing to limelight the conditions of life of the poor. Journalism in post–independence India, however, has been characterised by greater pre-occupation with the life of elite than with the life of the masses. The free press has shown total insensitiveness to the life of the urban and the rural poor.

This is also true by and large of Indian literature. One may recall how in western countries poverty and degradation of the working people in the early stages of industrialisation found its first poignant and indignant, expression in the novels of Dickens, Zola and a host of other social novelists of the nineteenth century. But Indian literature has perhaps yet to throw up its Dickens and Zola voicing the suffering and degradation of the poor in India. It may be remembered that Munshi Prem Chand made an immortal contribution to Hindi literature by making the Indian peasant, oppressed by colonial and semi-feudal oppression, the central figure of his creative writing. There are no doubt a large number of novels by writers in all Indian languages depicting the social reality of rural India after the end of colonial rule. But post-independence India literature has yet to create a character comparable to Prem Chand's "Hori".

If one considers the quality of Indian social science in terms of its sensitiveness to the existence of the poor, one finds social science much more deficient than even literary writing. The performance of Indian social science is conspicuously dismal in sharp contrast to social science in the West in its formative period. It may be noted that in the West sociology had its origin in social surveys into the conditions of the poverty-stricken masses. Moreover, studies of the miserable conditions of the working people during the era of 'primitive accumulation' served as a basis of the scientific as well as revolutionary writings of Karl Marx and Frederick Engels. Marx's "Capital" and Engels' "The Condition of the Working Class in England in 1844" drew upon the numerous surveys on the conditions of the poor to offer a comprehensive and trenchant indictment of the social system responsible for accumulation of wealth at one pole and for immiserisation at another pole. Indian social science, however, has failed to mirror the life of the poor in India in any significant and meaningful way, even though naked poverty is fast emerging as the most conspicuous fact of Indian life as a sequel to the much faster dislocation of the old economic and social order than the creation of a new order.

Nothing in fact reveals so sharply the state of social science as the fact that mass poverty provides the basis for many in the field of social science to get rich quick through poverty studies financed by international and national agencies. Moreover, poverty experts

travel round the world for seminars on poverty and unemployment without ever coming into direct contact with the poor themselves. Social science, with few exceptions, thus, provides a rich man's view of poverty and not the poor man's view. For the social scientist poverty is best understood when it is measured by "the poverty line", i e, by impersonalised magnitudes of poverty. By these scientific devices and procedures refinement is achieved in measurements of poverty but insight is not provided into basic issues relating to the genesis of poverty or the relation of poverty to the social, economic and political system within which the poor are deprived. The very definition of poverty evades the basic issues of fundamental change in the system which generates and perpetuates poverty. Poverty is presented as a marginal problem of an otherwise virile and vibrant system — a problem which needs certain corrective mechanisms and not a fundamental structural change.

Let alone the measurement-oriented and technocratic social scientist who writes about poverty but never comes into direct contact with the poor, even the fieldwork-oriented economists and social anthropologists have seldom made the poor the subject of their field investigations. Indian society has invested a vast amount of money, time and manpower in several dozen village studies by sociologists and social anthropologists. But the identity of the poor is lost, or the identification of the poor is completely obscured, by the failure of the social anthropologists to explore the fundamental division into haves and have-nots and by their tendency to give exaggerated importance to the less fundamental forms of social stratification like caste which mystify this division between the haves and have-nots. Social anthropologists have by and large ignored the role of caste as an ideological force obscuring the identity and crystallisation of the poor. The absence of any contribution by social anthropologists to poverty studies has [illegible] only impoverished social anthropo[illegible] the absence of a direct interaction [illegible] the people which was central to [illegible] classical anthropological perspective [illegible] also impoverished the very concep[illegible] of anti-poverty-planning and mobi[illegible].

[illegible] gravest weakness of poverty [illegible] and of anti-poverty mobilisation [illegible] they assign the crucial role in [illegible] crusade against poverty to the paternalism and the benevolence of the haves and their social and political representatives. But the poor are assigned no vital role in the fight against poverty. In other words, the greatest indictment of contemporary social thought and practice is that, to quote Karl Marx, "they see in poverty only poverty without noticing its revolutionary and subversive aspect, which will overthrow the old society"; they see in the poor only a helpless and pathetic human mass deserving pity and compassion of the ruling classes. Hence the endless discussions and deliberations of high-level experts and technocrats on schemes for the relief and uplift of the poor and on the best methods and means of implementing these schemes. What these sympathisers of the poor do not however see, or do not wish to see, is the process of transformation of poor into the *agents of social change*. Social thought has still to put into forefront the question as to how from a position of being the victims of their fate the poor are converted into an active social force capable of overthrowing the old system which keeps them deprived. They emerge thereby as instruments of creating a new social system which would put an end to their alienation from the means of production and from the process of distribution of the fruit of production.

II

Past history of many countries shows that the transformation of the poor from a passive human mass into a socially conscious, fighting *class* has been closely related to three important developments: (i) the accentuation of 'artificial poverty' in the midst of 'natural poverty' as a sequel to the growth of a market economy and capitalist economic order; (ii) the emergence of radical intellectuals as the creaters and disseminators of a new outlook on poverty linking poverty with 'exploitation' of direct produces by the masters of the means of production; and, finally, (iii) the 'emergence' of a critical consciousness among the poor as a sequel to the break from the fatalistic outlook and to a fundamental re-evaluation of their position in society and their role in social change.

If one turns to past history one finds that the aggravation of 'artificial' poverty was a necessary condition for the transformation of the poor into agents of social change. 'Artificial poverty' can be distinguished from 'natural poverty' in two ways. Firstly, while the latter is associated with a low level of development of productive forces, the former is the product of economic change and development itself. Secondly, under a regime of natural poverty, the conflict between the rich and the poor does not assume a naked form because of the mystification of this conflict by the institutions of caste, village community, etc. With the emergence of 'artificial poverty', the rich-poor conflict begins to assume a more naked form. Exploitation under 'natural poverty' is less naked because the poor exist as petty property owners. Under 'artificial poverty' it becomes naked as the poor who have been expropriated from material property ruthlessly and thoroughly are reborn as mere sellers of labour power. The emergence of 'artificial poverty' is, therefore, the process of transformation of the petty property owners into a propertyless mass. For a long time, however, the growth of propertylessness runs much ahead of the growth of wage labour, thus indicating pauperisation without proletarianisation. In other words, the genuine proletariat may be overshadowed for a long period by the lumpen proletariat and this fact may be responsible for blunting the revolutionary potential of poverty.

It should be noted that 'natural poverty' denotes a state of economic scarcity associated with underdevelopment of the economy or the social productive forces. Such underdevelopment of productive forces favours the acceptance of poverty as a natural phenomenon (i e, as god-given and unalterable) and to be shared by both the haves and have-nots alike. Under such a regime of general economic scarcity the *essence* of exploitation in the relations between the haves and the have-nots tends to get obscured by the *appearance* of interdependence. The *conflict* of interest gets subordinated to the *harmony* of interest imposed by the common struggle against natural economic scarcity. Even when exploitation is perceived, it is ignored by the have-nots as a price to be paid by them for the security provided to them by the haves.

A sharp discontinuity is introduced into this social situation with the emergence of a money and market economy and with the growth of a capitalist economy which is the most advanced form of a market economy. The capitalist economy, according to Marx, forced upon society the recognition of "the identity

between national wealth and the poverty of the people" (K Marx, "Capital" Volume I, 725). Further, "for exploitation, veiled by religious and political illusions, (capitalism) has substituted naked, shameless, direct, brutal, exploitation" (K Marx, and F Engels 1955: 36) This capitalistic social situation compelled a redefinition of poverty. In place of 'physical or material deprivation' resulting from underdevelopment as in the past, one encounters mass poverty, which, paradoxically speaking, was the product of 'development' itself. The very process of development which generated affluence for the few simultaneously generated poverty for the many (C T Kurien 1978 8, 77) Marx pointedly mentions the emergence of a new category of the poor, the 'free labouring poor", as "that artificial product of modern society" which was the product of dissolution of the old society This was to be distinguished from "the naturally poor" which were the product of the old (pre-capitalist) society ("Capital", Volume I, 760) The revolutionary potentialities of poverty are closely related in the Marxian conception to the emergence of the "artificially impoverished" as a new category of the poor as distinguished from the old category of the 'naturally arising poor' To quote Marx

> For it is not the naturally arising poor but the *artificially impoverished* not the human masses mechanically oppressed by the gravity of society but the masses resulting from the *drastic dissolution* of society, mainly of the middle estate, that form the proletariat, although as is easily understood, the naturally arising poor and the Christian-Germanic serfs gradually join its ranks (K Marx and F Engels 1957

According to Marx, the sharp demarcation of the "artificially impoverished" provides to radical philosophy its *material* weapon while the "artificially impoverished" find in radical philosophy their *spiritual weapon* for social change In other words "natural poverty" provides the soil for conservative philosophy oriented to *status quo,* while "artificial poverty" provides a favourable soil for radical philosophy oriented to structural change The idea of structural change does not grow into a social force as long as there is no nakedly *deprived class* which can serve as a vehicle of this idea In Marx's words: "It is not enough for thought to strive for realisation Reality must itself strive towards thought' (K Marx and F Engels, 1957. 52) But the deprived class also does not become an agent of structural change as long as it has no access to radical ideas.

It must be pointed out that there is often a time lag between change in the *objective basis* and a *transformation* at the subjective level. This lag is reflected in the emergence of 'artificial poverty' as a pervasive phenomenon without the emergence of the poor as a socially conscious force capable of identifying "the roots of their misery" (Karl Marx, 1961: 241)

It should be noted that in real life the phenomenon of *natural* poverty arising as a result of general economic backwardness is often mixed up with the phenomenon of *artificial* poverty arising as a result of the capitalistic development This intertwining of two qualitatively different types of poverty acts as a mystifying force, keeping the poor in darkness about the social genesis of poverty and thus thwarting their emergence as a socially conscious force The revolutionary potential of poverty may continue to be unexploited, or insufficiently exploited, for social change if 'the artificially impoverished' are overshadowed by the 'the naturally poor' This potential may also remain unexploited if the 'artificially impoverished' continue to interpret their poverty in terms of categories of understanding characteristic of the previous era (e g, religion, caste, village community, etc) In emancipating the minds of millions of the 'artificially impoverished' from the myths and illusions of the era of undifferentiated natural poverty and in ideologically remoulding their minds, the role of radical intellectuals is crucial They act as the carriers of a new consciousness of the radical potential of poverty and accelerate the transformation of the poor from mere victims of class exploitation into 'grave-diggers' of the very system of class exploitation.

III

It is necessary to emphasise the crucial distinction, as suggested by Marx, between conservative and a radical approach to the problem of poverty The former considers poverty as the outcome of a defective pattern of distribution of means of consumption (i e, income) and, therefore, lays the primary emphasis on restructuring the pattern of income distribution without reference to the pattern of distribution of means of production The latter on the other hand starts from the premise that "any distribution whatever of the means of consumption is only a consequence of the distribution of the conditions of production themselves" (Karl Marx, 1954) and any scheme of redistributing the means of consumption independent of the mode of production is bound to prove futile. Only that section of the poor which experiences in every moment of its social existence an acute perception of their complete alienation from the means of production has, therefore, a revolutionary attitude towards poverty or the potential of attacking poverty at its roots The remaining sections of the poor who are drawn into the system of ownership of the means of production in howsoever partial and inconsequential a manner are handicapped from perceiving the true causes of their poverty. In "The Eighteenth Brumaire of Louis Bonaparte" Marx characterised the small holding peasants as conservative in the sense that remaining in "stupefied seclusion within the old order they want to see themselves and their small holding saved and favoured by the ghost of the empire" He also saw their radical potential in so far as impoverished by the domination of capital, small holding peasants were forced "to strike out beyond the condition of their social existence" and seek in the urban proletariat "their natural ally and leader" (K Marx and F Engels, 1955 337, 338).

While demarcating Marx's approach from other approaches it should also be pointed out that a Marxist approach to the problem of poverty is at once a *structural* and a *developmental* approach The roots of poverty are identified by Marx in the sphere of the economic *structure* and not merely in the manner of *functioning* of this structure. Changing the structure rather than merely influencing the functioning of the structure appears as a crucial characteristic of the Marxist strategy for eradicating poverty At the same time, Marx was not an economic romanticist who believed that a structural transformation was by itself sufficient to abolish poverty Structural change only abolishes *artificial poverty* which is the product of the capitalist class system but not *natural poverty* which is rooted in the low level of development of productive forces In one of his most perceptive statements Marx expressed his view that "justice can never rise superior to the economic conditions of the time" (Maurice Dobb, 1947 148). Structural change is in Marxian conception, therefore, not a culmination of the struggle against poverty but only its beginning.

can become a crucial step in the ruggle towards abolition of poverty nly if it is an instrument of capital ccumulation (i e, of economic growth). tructural change becomes an engine f capital accumulation if it serves as neans of eliminating the gap between ctual economic surplus and *potential* conomic surplus and thus the means of nlargement of the size of the economic urplus and the mode of its utilisation or productive purposes (Paul A Baran, 958: 25-48).

The Marxian perspective on poverty iews the struggle against poverty not is a single leap from poverty to plenty out as a protracted struggle against nature, i. e, against the low level of levelopment of productive forces. The abolition of 'artificial poverty' through structural change becomes the initiator of protracted struggle against 'natural poverty', i e, against the low level of development of productive forces which is the ultimate cause of material poverty. The emergence of the 'artificially impoverished' as a separate category assumes historical significance in so far as it provides the social instrument of initiating the struggle against 'natural' poverty. In struggling for their own abolition as a separate category in the short-run, the class of the 'artificially impoverished' create the socio-economic and political preconditions for the abolition of 'natural' poverty itself in the long-run.

In the contemporary social situation in India this Marxian perspective which links up the struggle against poverty with structural change on the one hand and with capital accumulation on the other has great historical relevance. This perspective departs on the one hand from those ideologues who seek to cope with poverty without altering the pattern of distribution of means of production which generates and perpetuates poverty. It departs on the other hand from those romanticists who make no distinction between 'artificial poverty' and 'natural poverty' and who therefore detach the struggle against poverty from the historically necessary task of capital accumulation. What is required in India is a new unity between radical theorists who uphold an integrated perspective on poverty and growth and the 'artificially impoverished masses' who need this perspective in their struggle for a new life. meaningful struggle against poverty must, therefore, begin with a struggle against the current poverty of philosophy which "sees in poverty only poverty without noticing its revolutionary and subversive aspect which will overthrow the old society."

IV

Table I tries to highlight how the growing crystallisation of the 'artificially poor' as a *class* is fast emerging as a qualitatively new element of the Indian social situation. That this is a new element of the social situation in many Asian countries is confirmed by a number of recent works. Out of the numerous studies financed by international and national agencies which mystify the phenomenon of poverty, there are some exceptions like the ILO studies published in 1977 ("Poverty and Landlessness in Asia") which sharply indicate the emergence of a new type of poverty accompanying substantial economic growth in many Asian countries. These studies sum up the main features of this poverty as follows:

(i) The most outstanding facts to be noted are the worsening distribution of income and the declining real income of the rural poor at least in a number of cases. Those studies which contain the relevant data show that the shares of the lower decile groups in aggregate income and consumption have been declining *even during periods of rapid agricultural growth.* There are significant differences from country to country as regards the proportion of population that has been adversely affected, but in each country for which data exist a substantial proportion of the lowest income groups appears to have experienced a decline in their share of real income over time. Indeed, the evidence from the case studies points to an even stronger conclusion.
In each case a significant proportion of low income households experienced an absolute decline in real income.

(ii) The countries studied are all characterised by a highly unequal distribution of land ownership... The continuation of highly unequal ownership of land during a period of rapid demographic growth has resulted in increased landlessness and near-landlessness.

(iii) The answer to the question why the poverty of the poorest groups of the rural population has increased has more to do with the structure of the economy than its rate of growth.... The initially high degree of inequality of income and wealth, the concentration of the economic surplus in few hands, and the fragmented allocative mechanisms constitute a socio-economic context in which powerful dynamic forces tend to perpetuate and even accentuate low standards of living of a significant proportion of the rural population.

(iv) Most of the poor are not unemployed and many of the unemployed are not poor.... The movement of labour represents little more than a shuffling around of poverty. As long as the economic structure remains as has been described, with its income distribution and resource allocation mechanism intact, the major function of rural to urban migration is to spread the growing poverty of the countryside to the towns" (ILO, 1977: 9;11; 22; 25).

It is clear that the social situation in many countries of Asia has been undergoing a qualitative transformation with the emergence of a new type of poverty. This poverty is not 'due to general stagnation of the economy' but due to an economic system in which vast masses are alienated from the property structure and the mode of production and, consequently, from the mode of distributions of the fruits of production. The key to this poverty in spite of economic growth lies in the very nature of the economic system. In this new social situation an objective basis is emerging now for the comparatively sharper crystallisation of the poor as a nakedly deprived class than in the past. An objective basis is also emerging for greater unity of the rural and urban poor since the urban poor are in most areas the rural poor pushed out into urban areas. The recent resurgence of *ruralism* dramatising the rural-urban cleavage or of *casteism* dramatising the caste disparities rather than the rich-poor cleavage is meant to a large extent to mystify and obscure the fast-growing class differentiation in the rural and in the caste communities.

In recent years some studies have provided insights on the growing class differentiation within the peasantry and within castes without, however, assessing its significance for social and political movements. We refer to the findings of a few of these studies as illustrations of the tendencies of downward mobility within the upper castes and of upward mobility of social strata within the middle and the lower castes.

In a study on 'Regional and Caste Factors in India's Development' K N Raj tried to analyse the data on caste and occupation as provided by the National Sample Survey, Fourth Round. Table 2 has been reproduced from

TABLE 1: MODELS OF POVERTY IN INDIA

Period	Model of Poverty	Nature of Economy	Nature of Poverty
Pre-British	Poverty-Model — I	Natural or semi-natural agrarian economy; low level of productive forces; community modes of ownership of property, production, and distribution acting as a check on the excesses of private property and private appropriation.	(i) Predominance of natural poverty. (ii) Rich as patrons of the poor through the Jajmani system. (iii) Shared poverty, hence poverty within framework of security. (iv) The existence of poor as a class obscured by community framework.
Pre-Independence	Poverty-Model — II	Money and market economy of the colonial type, predominantly agrarian but growth of colonial tertiary sectors; stagnation of productive forces but dislocation of traditional agrarian structure without growth of modern industrial structure; overpressure on land; pauperisation without proletarianisation and rural-urban cleavage as the main feature of colonial economic structure.	(i) Emergence of 'artificially impoverished' of the colonial type; erosion of Jajmani system. (ii) Aggravation of rural poverty but erosion of traditional security. (iii) The poor as a pauperised rural mass against town-based colonial and semi-feudal exploiters; rich *vs* poor obscured by urban *vs* rural.
Post-Independence	Poverty-Model — III	Market economy of emerging capitalism; diversification of economic structure and considerable growth of productive forces but emergence of a dual economy; modern sector *vs* subsistence-oriented economy, proletarianisation as well as pauperisation; differentiation of rich and poor within the urban and rural economy.	(i) The aggravation of system-generated or 'artificial poverty' as a consequence of development. (ii) Rural poor also pushed out to become urban poor. (iii) Growing demarcation of the rural and urban poor from the urban and rural rich; inner class differentiation within castes and rural community. (iv) The growing crystallisation of the 'artificially poor' as a classs in the midst of a pauperised rural and urban mass.

this study. (The definitions of caste and class have also been given in this Table) While taking note of the imperfection of the data on caste and class, Raj offers the following findings from the available data :

> That there is a correspondence between 'caste' and 'class' at the two extremes appears to be thus borne out by the figures. But it is also clear — particularly in the intermediate categories — that class cuts across caste divisions. Thus nearly 7 per cent lower caste households in the rural areas are 'farmer' households, and the number of lower caste households among the total number of 'farmer' households works out to well over 40 per cent....
>
> Similarly, more than 18 per cent of the middle caste households, it would appear, were 'agricultural labourers' and 'share-croppers'. The number of rural Hindu households belonging to these two categories was 13 3 millions of which the middle caste accounted for 2.2 millions. Approximately one out of every six households occupied as agricultural labourers and share-croppers in the rural areas belong to the middle caste group (K N Raj, 1981: 111).

Unfortunately no comparable data are available for the later period to provide insights into changing class differentiation within caste over time. But on the basis of information available at the micro level it is possible to suggest that the internal class differentiation within the upper, the middle and the lower castes has been intensified in recent years.

Srinivas's recent village study, "The Remembered Village" takes note of the divergence of class from caste in the following words :

> There was a certain amount of overlap between the twin hierarchies of caste and land. The richer landowners generally came from such high castes as Brahmin, Peasant and Lingayat while the Harijans contributed a substantial number of landless labourers. But a few members of the low castes such as the Smith, Oilman and Toddyman owned reasonable amounts of land while several Peasants and Shepherds were without land. Such lack of overlap between the two hierarchies produced interesting consequences (M N Srinivas, 1976: 169).

One finds Srinivas speaking of "conflicts between the rich and the poor" and of "more effective exploitation of the poor" by the wealthy and the powerful of the village (p 225) in the present work while in his earlier village study he spoke mostly of high and low castes.

A sharper focus on the increasing divergence of class from caste is offered by Beteille's study of a Tanjore village.

> In traditional society, and even fifty years ago, there was much greater consistency between the class system and the caste structure. One can even say, with some risk of over-simplification, that the class system was largely subsumed under the caste structure....
>
> Over a large area of the agrarian economy, the traditional arrangement seems to have been thus: the Brahmin Mirasdars owned land which they leased to non-Brahmin tenants who had it cultivated by engaging Adi Dravida labourers. This of course is a highly simplified picture, and even in the traditional economy there were exceptions to the simple correspondence between Brahmin and landowner, Non-Brahmin and tenant, and Adi-Dravida and agricultural labourer. These exceptions have increased considerably over the last fifty years. This class system can no longer be seen simply as an aspect of the caste structure (Andre Beteille, 1966: 191; 195).

Beteille has drawn attention to down-

TABLE 2: OCCUPATIONAL DISTRIBUTION OF DIFFERENT CASTE-GROUPS AMONG HINDU RURAL HOUSEHOLDS

(In millions)

Occupation	Upper Caste	Middle Caste	Lower Caste	Scheduled Caste	Total
Agriculture					
Farmer	1.09	0.93	1.69	0.18	3.69
	(24.38)	(7.57)	(6.95)	(1.54)	(7.85)
Cultivator	1.96	6.52	10.20	3.19	21.87
	(43.91)	(53.30)	(41.79)	(27.05)	(41.35)
Share-cropper	0.17	0.76	1.51	1 00	3.44
	(3.91)	(6.18)	(6.17)	(8.50)	(6.50)
Agricultural Labourer	0.05	1.46	4.11	4.27	9.89
	(1.09)	(11.91)	(16.85)	(36.19)	(18.70)
Forestry, Fishery and Livestock	0.02	0 17	0.81	0.28	1.28
	(0.62)	(1.39)	(3.31)	(2.38)	(2.42)
Total Agriculture	3.29	9 84	18.32	8.92	45.37
	(73.91)	(80.35)	(75.07)	(75.66)	(76.33)
Others	1.17	2.39	6.09	2.87	12.52
	(26.09)	(19.65)	(24.93)	(24.34)	(23.47)
Total All	4.46	12.23	24.41	11.79	52.89
	(100 00)	(100.00)	(100.00)	(100.00)	(100.00)

(Figures in brackets represent percentages of All-India average in each case.)

A *Definitions of classes*

(i) Farmers — "who cultivate their own land mainly with hired labour".

(ii) Cultivators — "who cultivate land mainly owned by them, and sometimes land taken on lease or share cropping system with the help of other household members and partly with hired labour".

(iii) Share croppers — "who take up cultivation of others land in a crop sharing basis and cultivate without hired labour".

(iv) Agricultural Labourer — "who work on other's land on the basis of wage payment".

B *Definition* (i) The *upper castes* were defined as those who according to custom used the sacred thread, the *middle* as those from whom the Brahmins take water by tradition and the *lower* as the other castes who were not scheduled.

Source : K N Raj: 'Caste and Regional Factors in Economic Development' in J C Daruvala, "Tensions in Economic Development in South East Asia", 1961.

ward mobility among the Mirasdars and the upward mobility among the Non-Brahmin peasants and Adi-Dravida labourers He pointedly mentions those upward-moving non-Brahmin peasants" who have acquired the status of landowners and Adi-Dravida labourers who have become tenants or acquired ownership of small parcels of land (pp 194-198) Noting the differentiation in the tenantry, he draws attention to tenants with big leases who may identify themselves more closely with landowners than with small peasants" (p 207).

Analysing the changes in the role of caste in the village economy, Kathleen Gough's 'Caste in a Tanjore Village' notes how "the caste community is no longer homogeneous in occupation and wealth" and how "caste is today a limiting rather than a determining factor in the choice of occupation" (K Gough, 1971 32) She also draws attention to economic polarisation among Brahmins as indicated by "some owning upto 30 acres of land and others as little as 3 acres" Moreover, she also takes note of the economic heterogeneity among Non-Brahmins: "among 43 non-Brahmins who remain in agriculture or horticulture three are small minor cultivators, nine are *Pannaiyals* contracted by the year, ten are daily coolies, and twenty one lease land on *Kuthakai* tenure" (p 32). Similarly those low castes who have remained in agricultural labour are highly stratified. Only 22 per cent are now Pannaiyals Thirty eight per cent have in the past become *Kuthakai* tenants on the same terms as non-Brahmins while thirty-nine per cent have sunk to being daily coolies and one man has risen to the status of a small owner cultivator" (p 32).

Gough offers the following assessment of the evolving social situation.

> In Tanjore villages in 1952, indeed, one major conflict overrode all others. that between the landed and the landless It results from acute agricultural over-population, the concentration of land-ownership within a small fraction of the population, and the failure to develop industrial employment for surplus villages It seems logical to conclude that such *economic and class conflicts*, whatever their outcome, will in the future weaken the identities of caste (Gough 1971. 59)

Another village study of Thaiyur Panchayat (Tamil Nadu) sums up the caste-class nexus in the following words:

> There is a strong but far from perfect correlation between caste and class: 18 per cent of the non-Harijan households belong to the upper class of big farmers, while only 3 per cent of the Harijan households do. This implies that the traditional relations of production which always involved members of different castes in antagonistic positions still largely persist... But in terms of absolute numbers, class of big farmers consists of more Harijan households than non-Harijan ones This implies that members of the same caste meet in relations of exploitation, and since this is at variance with the caste ideology, we can also expect changes in the ideological universe. The Harijan predominance in the class of middle farmers is likely to work in the same direction. There is a sizeable group of Harijans who no longer are poor and exploited, and whose economic position contradicts their impurity. The economic position of the Harijans is no longer homogeneous, but since the heterogeneity must be accounted for we expect to find a new ideology which encompasses all aspects of Harijan experience (G Djurfeldt and S Lindberg 1976: 216-217).

We have *deliberately* drawn upon village studies mostly from South India because the overlap between caste and class was reported to be the closest in this part of the country. The divergence of class from caste, therefore, emerges very sharply from studies of the changing villages relating to this part. One can, however, refer to case studies relating to other parts which reveal the same tendencies.

Anand Chakravarty's study of a Rajasthan village reveals that the new landowning class is no more identical

with the Rajput caste. Thus as a consequence of downward mobility among the Rajputs and upward mobility among non-Rajput castes, the landowning class is now multi-caste in composition. The broadening of the landowning class has been associated with class differentiation within the upper, middle and the lower castes (Anand Chakravarty 1975: 96-98, Table IV. 7-117-112).

Another outstanding work which throws light on the transition from caste to class is Jan Breman's study of South Gujarat villages, "Patronage and Exploitation" (1974). Breman characterises this process as "depatronisation" of relationships between the dominant landowning castes on the one hand and the labouring castes on the other. He shows the close link between "depatronisation" or the transition from "patronage" to exploitation and the fundamental alteration in the nature of rural organisation — a changeover to a capitalist mode of production" (p 253). He notes that "the contrasts in the rural regions between the weakest and the strongest party have sharpened" as indicated by open forms of "large scale rural pauperisation" (p 255). He considers this as a qualitatively different situation. "To the conclusion that exploitation was inherent in the *hali* system, and that patronage may occur in a situation of exploitation should be added the comment that *the difference between past and present is more than one of degree*" (p 225).

Another significant aspect of Breman's study is that it shows the transformation of the rural poor into the urban poor The rural poor contribute to the "emergence of the informal sector' in the urban economy.

> And yet the attempt of the village population to break out of the rural system into non-agrarian fields cannot be explained by the magnetic effect of the district town and other employment centres: its main cause is expulsion from the agricultural economy. It is not merely the result of population growth in which an increasing supply of labour eventually becomes a surplus. There have also been changes in the mode of production in agriculture which have led to a redefinition of labour utility....
>
> The fact that it is impossible to accommodate the available labour force within this sector has led to a situation in which a steadily increasing proportion of the rural population is compelled to seek a living outside agriculture or at least to find a complementary income (Jan Breman, 1977: 173).

Breman's study yields insights into the objective basis as well as the subjective perception of poverty. One finds that "depatronisation" and impersonalisation of economic relationships are leading the rural poor increasingly to "a collective awareness of their condition of subjection, a feeling of being wronged and the beginning of an attempt at collective opposition against their exploiters" (p 230). Breman adds at once that "the conditions that are a prerequisite to implementing their protest organisationally in an effective way are lacking" (p 230). In other words, the potential strength of the poor is enormous but their actual bargaining or striking power is extremely limited. Breman's analysis of why the revolutionary potential of poverty does not get realised is very illuminating. To quote:

> From various parts of India there have recently been reports of agricultural labourers who are beginning to offer resistance against the exploitation to which they are exposed.
>
> The horizontal ties among the *Dublas* (the labouring groups) have remained weak. Some are more oppressed than others. As sharecroppers, servants, casual labourers, and gang labourers they have no parallel interests. The limited favours that can be obtained in a situation of extreme and continuing scarcity situation lead (again) to patronage-like relationships. An attitude of protest, for instance, is incompatible with the need of showing oneself worthy of consideration by behaving 'well'. Intra-class antagonism manifests itself in dissension and mutual watchfulness. If someone refuses to work for one rupee, another is always prepared to take his place... *In the situation of poverty there are undoubtedly elements that constitute obstacles to mutual solidarity*" (p 257).

While taking note of this inhibitive aspect of poverty in the short run, Breman highlights the social dynamics of poverty under capitalism which in the long run unifies and activises the poor.

> It is the aggregate of inequality — economic and political — along with social polarisation that forms the basis for a growing collective perception of injustice, even if fear of sanctions usually limits any expression of it to verbal avowals during encounters in their own hamlets. Indeed their awareness of unity is further stimulated from outside because *Anavils* (the landowning class) regard all the *Dublas* being cut from the same cloth. The landlords are strikingly uninformed about anything concerning their labourers, including the contrasts among them, and what is more, they are totally indifferent to them (p 257).

Sociologists have drawn attention not only to the trend of class differentiation in villages and in castes but also to the transformation of castes into political factions. Leach has argued that such political role of caste is "a defiance of caste tradition" which may "not be clear either to the actors or to the anthropological observer" (Leach, 1971:6). He has, however, not clarified whether the emergence of caste lobbies helps the rich or the poor of the caste groups. Andre Beteille has provided an insight into the exploitation of caste loyalties as an instrumentality for furtherance of their class interests by *the top groups of the emerging agrarian* hierarchy. To quote:

> Thus, the top of the emerging agrarian hierarchy consists of a set of individuals having certain common social and economic properties, linked together in loose-knit networks and becoming increasingly aware of their common economic and political interests. Those at the top have advantages of both resources and skills. Sociologically the most distinctive feature of the progressive farmers is that they combine ownership of land and capital with skills in manipulating both 'traditional' and 'modern' institutions" (A Beteille, 1974.112).

He thus calls this new class "ambidextrous" and notes "the decline of the community" as consequence of the consolidation of this new class (p 105).

V

It can be seen from above that the revolutionary potential of poverty would be obscured if the question of rich *vs* poor is misrepresented as a question of town *vs* the village or of caste *vs* caste. It is idle to think that poverty in the rural areas can be fought without the support of the urban poor and that rural development can be achieved without the support of urban industrial development. It is also idle to think that the poor of one caste can secure an enduring advance in their material condition without unity with the poor of the most oppressed castes who stand opposed to exploiting the idea of caste for dividing the poor and for thwarting the process of their transformation into an agent of structural change. Town *vs* village and caste *vs* caste, therefore, ultimately helps in perpetuating system-generated poverty.

Ruralism and Casteism in the above background perform the ideological function of mystifying the real processes. They provide to the new rural elite the banner for agitation with a view to extracting more resources in the name of the rural community and of 'backward'

castes. The enhanced resources are, however, used not for mass-oriented development but for strengthening the interests of dominant groups in the village and of dominant sections in the 'backward castes'. They provide the ideological cover under which the emerging power-elite in the village resorts to intensified and ruthless exploitation of the rural masses in new ways. In short, in present-day India Ruralism and Casteism are the most formidable obstacles in transforming poverty into an agent of structural change.

Tradition and Change among Industrial Workers

Uma Ramaswamy

This paper attempts to understand the forces that influence the social life of industrial workers. What happens to the gamut of the workers' experiences in the workplace and in the trade union? Do they have any significance for his life outside the work sphere? If they do, how do these new forces relate to the traditional loyalties of the workers? Do traditional loyalties get displaced, or do they get transformed in the process of interacting with new ones?

Some of these questions are answered in the context of three broad areas: the culture of the leaders and their role in the social life of workers; inter-caste relations especially between the Harijans and the upper castes; and the forces influencing the politics of a working class neighbourhood.

CASTE continues to be an overpowering influence in the social, economic and political life of the country in spite of constant admonitions by politicians and intellectuals that narrow, parochial loyalties should be set aside. However, industrial workers and their work organisations appear to be moving away from the powerful hold of caste. Theorists of industrial society such as Inkeles and Kerr have argued that the logic of industrialism transcends cultural barriers, and that as societies industrialise they will move rapidly away from tradition.[1]

Some of the early commentators on the Indian labour scene have taken conflicting stands on this question.[2] They have either asserted the dominance of caste or argued the opposite—both stands being unsubstantiated by empirical evidence. More recently, Holmstrom has argued that in the industrial situation caste identities tend to get submerged. Castes may differ in terms of their customs and institutions, and people may readily use caste links to get jobs and to move up. But moral thinking tends to become universalistic. It is not that there are no inequalities based on caste status, but that people feel compelled to justify this inequality instead of merely assuming it.[3] Sheth's study of a factory in Western India conveys a somewhat different picture. He shows that workers use the caste idiom to explain away others' successes and rationalise their own failure. But he admits that he is unable to show how far the caste loyalties of managers and workers really affect the functioning of the factory.[4] E A Ramaswamy, in his study of trade unions of mill workers in Coimbatore, has argued that the multiplex ties linking the worker with his union have created powerful new forces and bases of loyalty which cut across the traditional.[5] His analysis shows that the recruitment of workers to the industry and the workers' choice of unions are unaffected by caste loyalties.[6] However, his analysis stops at the factory and the trade union, and does not extend to the social life of workers.

This paper attempts to understand the forces that influence the social life of industrial workers. It concerns the very workers whom E A Ramaswamy described as having come under the spell of powerful new loyalties unleashed by unionisation. What happens to the gamut of the workers' experiences in the workplace and in the trade union? Do they have any significance for his life outside the work sphere? If they do, how do these new forces relate to the traditional loyalties of workers? Do the traditional loyalties get displaced, or do they get transformed in the process of interacting with the new ones? I have attempted to answer some of these questions with data collected during fieldwork in Tyagipuram, an industrial suburb in Coimbatore, South India, where I took up residence for 10 months in 1977-1978.

Tyagipuram is within earshot of at least a dozen cotton textile mills. Work in the mills is the dominant source of livelihood. Out of 130 households in the neighbourhood, all but a few have at least one millworker. Tyagipuram is a co-operative housing colony, built in the early sixties at the initiative of the Coimbatore District Textile Workers Union (TWU). Like any other residential area in the locality, the population of Tyagipuram is mixed in terms of caste. Out of 130 households, 85 are Naidu and 25 Gounder, the two major castes in the area. There are two households of Pallar, an important Harijan caste in the area. The rest belong to a medley of castes. In the following discussion I have confined myself to three broad areas—the culture of the leaders and their role in the social life of workers, inter-caste relations with special reference to relations between the upper castes and Harijans, and the forces influencing the politics of Tyagipuram Co-operative Society.

The Leaders

Traditionally, the trade unions in Coimbatore have directed their attention not merely to the work life of their members, but also to the totality of their social life. The uniqueness of Coimbatore unions lay in their extending their activities to the villages where the workers lived. A leader reminisced, "The Coimbatore unions, unlike those in Madurai, were not built around individual leaders. We built up the union from the grassroots, and drew in the general public. We insisted that a third of the branch committees should be made up of members of the public. Workers brought even family disputes to the branch office. What could not be settled at the branch went on appeal to the head office. N G Ramaswamy (founder of the TWU) would go to the villages to talk to the families of workers. We activists have spent much time in worker houses and shared food with their families. In my own house, we had special arrangements to feed my friends from the movement." The solid work put in by the leaders during the incipient stages of the movement sustained the spirit of trade unionism in mill worker neighbourhoods and earned them the title of Tyagi—literally, one who has sacrificed. This was an apt title because the leaders had sacrificed not only for the cause of labour, but also in the cause of the nationalist movement. Even though many of today's leaders do not conform to this image, workers give a great deal of importance to leaders and leadership.

The uniqueness of mill worker neighbourhoods consists in the importance accorded to the *Thalaivars*, as the

leaders are known. The leaders of the community are the very people who are active in the mill, trade union, and political party. There is something distinctive about activists. I shall bring this out with a profile of an activist.

Subramaniam, a Gounder in his early fifties, has been a mill worker for over three decades. He is a mill-level trade union leader, although he is not as active as his colleagues would like him to be. Much of his spare time is taken in tending the three buffaloes he owns. His wife sells the milk; and supplements the family income. Subramaniam has had no formal education. But he is a generous father who has spared no effort to educate his children. Two of his sons are in college and the third is in school.

Subramaniam calls himself a socialist. He is deeply committed to his party and union. He has internalised his party ideology so well that he believes it to be essential to show his socialism in deed. He says that a socialist has no caste. He wanted to marry outside his caste, but parents and relatives persuaded him against this. He freely invites untouchables to his house. His wife did not approve of this in the beginning, but has now reconciled herself to it. He added that the untouchables did not always reciprocate his sentiment and freely enter his home. The Chakkoliar, in particular, would stand out and talk to him through the window.

Subramaniam has travelled extensively. He has spent from his pocket to attend union and party conferences in far-off North India. He was in the contingent which visited Delhi in May 1977 when the Janata party was born. During his visit to Delhi he was lost and felt a fool because he knew neither Hindi nor English. He is keen that, as a socialist and citizen of India, he should learn Hindi.

Subramaniam has managed to save Rs 10,000. Although he could invest this money in building a better house for the family, he prefers to live in his cramped quarters and spend the money on educating his three children. He is certain that he would not like them to be mill hands. He is happy that, unlike other college students, they tend to the buffaloes and even remove the dung. But he is categorical that they should take government jobs. It did not matter if one got Rs 300 in a government job or similar white-collar position. It is preferrable to earning Rs 600 in a mill. Mill work is abnormal, he contends, because of shift work. It is abnormal that a man should work at night and sleep during day. Mill workers are like frogs in a well. They are lost in the routine of the mill and humdrum of family life. Unlike a white-collar worker, the mill worker has no exposure to the wider world. They take no interest in the larger problems of society. He wants his children to have a wider world view and be good citizens. He emphasised that this was the main reason why he wants them to study as much as they can.

Subramaniam represents the lowest cadre of union leaders at the mill level. Leaders of this stature are to be found in great numbers in and around Tyagipuram. Tyagipuram also has a good number of leaders of higher rank ranging up to the secretary of a union head office. These union activists constitute a closely knit group with a culture of their own. Their families closely interact with each other. There is a lot of social visiting among them. On important occasions, such as marriage, they help each other in a variety of ways. The pattern of obligations between activists is so well established that those who do not conform face severe criticism. Top leaders are expected to be present at weddings and deliver formal speeches blessing the couple. Speeches are given by leaders in order of seniority, and they have a high political content. The entire procedure is highly stylised. At one time, marriage cutting across union ties was unthinkable, especially for activists. They freely take place today. The dominant partner may even convert the spouse to his or her union. Where the spouses belong to different unions, two panels of speakers may be arranged. Besides being present and helping in a number of ways, active unionists are also expected to make gifts which would cover part of marriage expenses. These presentations are always reciprocated. A similar pattern is observed in all rites of passage.

The availability of leadership skills in abundance has led to the organisation of community affairs along lines which closely resemble union organisation. Workers believe that a leader is essential to organise any major activity. Mill workers are great organisers and this is decidedly a carry-over from the workplace and the union. Even the celebration of a religious festival, including the monthly *krithigai*, is organised along familiar lines with a president, secretary and treasurer, if not also an executive committee. Chit funds, pilgrimages, tours, and practically any other activity involving a sizeable number of people and mobilisation of resources are similarly organised.

The leaders are a general resource. The union secretary, for instance, is approached by neighbours to fix school and college admissions, to recommend for jobs in the industry as well as outside, and to push matters in municipal and other offices. The following example gives a glimpse of the kind of help the workers seek from their leaders. The brother of a union activist got involved in an accident when the bullock-cart he was driving with a load of fodder was hit by a car. The president, assistant secretary, and treasurer of the union spent the entire day at the police station helping the worker register a case and demand compensation from the car owner. The police could not lightly dismiss the case or hush it up after taking a bribe from the car owner, because the union leaders were powerful men in the locality. Eventually, the owner of the car had to be sued for compensation. The president fixed the union advocate for the purpose. In a similar case, a minor union leader who had taken part in the Independence movement was helped by the president to claim the pension that had been sanctioned by the government for freedom fighters. Papers had to be moved in Delhi and Madras, and this could not have been done without the contacts and influence of the president. Finally, the leader not only got the pension but also the arrears. In yet another instance, the daughter of a worker died suddenly of a stroke. The police, suspecting suicide, took the body to the morgue. The intervention of the union president was sought to obtain the release of the corpse.

INTER-CASTE RELATIONS

Mill workers come from a wide variety of castes. Perhaps, the only notable aspect of the caste composition of the workforce is that there are very few Brahmins. The villages in the vicinity of the mills once had a large Brahmin population. But Brahmins accorded a poor rating to mill jobs. Most of them acquired education and moved out to the big cities. Only the poorest Brahmins have stayed on. With the exception of Brahmins, a cross section of all castes is to be found in the mills.

Workers are aware of the fine distinctions between castes, sub-castes, and indeed the smallest endogamous groups. But there is no clear and uni-

versally accepted ranking of castes. One of the reasons for this is that, barring the Harijans and the numerically insignificant trading castes, everyone is a Sudra. What exists is a rough ranking of loose clusters of castes of similar ritual rank and economic status. Gounders, the peasant caste of the district, Naidus, Mudaliars and Pillais are considered to form the top cluster. The trading castes comprising Tamil Chettiar, Telugu Chetti, and Komati constitute another cluster. It is difficult to place this cluster *vis-a-vis* the earlier one in terms of rank and status. The third cluster consists of Thevar, Konar, Nadar, Udayar and Golla. Service castes, such as Vannan, Navidan etc, constitute another cluster. Interestingly, the Harijans cannot be said to constitute a homogenous cluster. The upper castes themselves draw a distinction between Pallar and Parayar, the traditional farm labourers who have now made good with education, government jobs and mill employment, and the Telugu-speaking, leather-working Chakkiliar. The Chakkiliar occupy the lowest position in society. The term 'Harijan' is increasingly used to refer exclusively to Chakkiliar. The Pallar prefer to call themselves Pannadi (literally, lord of the farm), and the Parayar refer to themselves as Adi Dravida.

It needs to be added that many of the castes named here are themselves clusters in their own right. Thus, Naidu is a title adopted by the Kamma, Gavara and Balija castes. Likewise, Gounder is a title adopted by Vellalar, Vettuvar, Padayachi and Pulivar.

The existence of loosely integrated caste clusters does not mean that people do not have loyalty to their particular caste, or that there are no caste conflicts. Castes of similar rank compete for dominance. The Gounders, who are really a peasant caste, are critical of Naidus who have done very well in industry and education. The Naidus' business acumen is unmatched by the Gounder. But the Gounders are the true sons of the soil. The Naidus claim to be superior to Gounders, who in their view are illiterate simpletons given to peasant ways. The caste idiom is also used to rationalise one's own failures and explain away others' success. Naidus are found in great numbers in the workforce and this is attributed by other castes to the predominantly Naidu ownership of the mills. They argue that, since recruitment is influenced heavily by recommendation, it is easy for a Naidu to get in. Gounders complain that they are an underprivileged lot. One frequently hears them remark that, to get a job, you must be either a Naidu or belong to a Scheduled Caste. The Naidus, on the other hand, justify their recruitment on the ground that the management knows them to be good workers. Objectively speaking while recommendations do matter a great deal, it is difficult to say that they work only in favour of Naidus. It must also be kept in mind that the Naidus constitute a sizeable proportion of the population. An examination of the caste composition of the workforce of a Naidu-owned mill does not reveal disproportionate representation of any particular caste.

One also finds stereotyped images of individual castes. Gounders are rough and ready and simple-minded. 'Muttal Gounder', literally 'foolish Gounder', is a common epithet. Naidus are clever, ambitious, intelligent, and clannish. Thevar are untrustworthy and tight-fisted. So are the Konar who would put their children to employment rather than educate them. Pallar are rowdy and ready to blackleg. Chakkiliar are dirty, untrustworthy and compulsive liars.

The hostility and prejudice between castes find special expression on religious occasions. The Mariamman festival in Tyagipuram is an occasion when castes stake their claims to precedence. The order of seating before the deity, the right to distribute *prasadam*, etc, are frequently matters of contention. At the end of the festival the *kalasam* is carried by all the castes to the river for immersion. Every year, the Pallar ask for the right to carry the *kalasam*, but this has always been denied. At festival time, the deity is taken around the streets of the neighbourhood. A Naidu leader wanted the deity to be brought to his house first and this was severely opposed by the Gounders.

Occasionally, quarrels between individuals take on a caste dimension. A youth association in the neighbourhood of Tyagipuram managed to bring piped water to the area after a long struggle. A quarrel broke out at the hydrant between a Naidu and Gounder. Soon this turned into a conflict between the two castes.

Caste also continues to perform some of its traditional functions. Marriage is by and large endogamous. In spite of the explicit preference for endogamous marriage, there have been several alliances cutting across caste. Where it does occur, the approval of the community depends on whether the castes of the bride and groom are compatible.

Where the bride and groom are of similar rank, the opposition is a temporary one and wears off eventually. The significance of caste clusters is clearly seen on such occasions. Many marriages across individual castes within a cluster have been rationalised on the basis of similarity of status. There has also been an increasing incidence of alliances between people of vastly different caste rank. There was an instance of a Gounder girl who married a Chakkiliar. The bride's natal family boycotted her outright. Her brother who was less opposed to the marriage visited her once in her conjugal household. He was so unused to Chakkiliar ways that he felt offended at the behaviour of his affines. The sister was so upset at this that she committed suicide. There is another instance of a Naidu worker who married a Chakkiliar girl. Unable to bear the humiliating treatment of the neighbourhood, he left his home and mill job. He took a job in a tea shop in a place far away, to escape from his familiar surroundings. Where the marriage is between a Harijan and an upper-caste person, residence in an upper caste locality becomes next to impossible. The couple have either to live in a Harijan *cheri* or seek the anonymity of Coimbatore city.

Castes are increasingly ceasing to be commensal units. Commensal relations, especially among castes above the line of pollution, are far from rigid. Workers freely eat in each others' houses. Even between upper castes and Harijans, as we shall see later, the barrier of commensality has broken down to some extent.

The big divide in the caste structure is between the Harijans and the rest. I shall use the term 'Harijan' to refer to all the three Scheduled Castes — the Parayar, Pallar and Chakkiliar — although in Tyagipuram itself the term is often used to refer exclusively to Chakkiliar. The Parayar have availed of the educational facilities extended to them, and are now to be found in large numbers in government and other salaried jobs. They have also become converts to Christianity in large numbers. As a result of these developments, Parayar now enjoy a modicum of respectability. The Pallar have been less enterprising in the matter of education and government employment. But they are found in mill jobs in substan-

Year after year - our nation is advancing. Advancing towards a better tomorrow. Growing from strength to strength.

And so with Andhra Bank. Growing in the service of the nation. And growth - a reflection of the confidence of the people, in us. Borne out by the phenomenal increase in deposits from Rs 141 crores to Rs 438 crores in just five years Registering a growth rate of 37% in 1978 And our advances to Rs. 280 crores during the same period. Showing how people-oriented we are.

Spreading out to serve the people better —

With 666 branches all over the country what else can you expect ? Meeting the people's financial needs for over 55 years now. Doing our bit to strengthen the financial base of our country. Right from the weaker sections and small and marginal farmers Thereby helping make life a lot easier.

Andhra Bank -
the bank responsive to people's needs.

We thank all our customers for their unstinted support which helped us turn out another record performance.

The Andhra Bank Ltd.

Regd. & Central Office:
Sultan Bazar, Hyderabad-500 001.

tial numbers. The upper castes do not treat the Pallar with the contempt generally shown to the Scheduled Castes. It is said that the Pallar are violent, and fear of their physical prowess has earned them some deference. The Chakkiliar have remained where they have always been. They have remained backward, with neither education nor economic backing.

All the three major Harijan castes are found in textile mills. There are a greater number of Pallar and Parayar than of Chakkiliar. Mills located close to Harijan *cheris* have a substantial number of Harijan workers. The mills do not employ them to do menial jobs, as is commonly believed. They occupy a variety of positions, and it is not uncommon to find a Harijan jobber getting work out of clean caste workers. The upper castes are now evidently less discriminating against the Harijans. The necessity of close interaction on the shop-floor among the workers, irrespective of caste differences, has contributed greatly to the breakdown of the traditional barriers.

Harijan workers themselves admit this. A Parayar union leader remarked that even in his area, with its Thevar domination and notoriety for casteism, every one was treated alike inside the mill. Harijans are not addressed by their caste name any more, either by workers or by managers. At lunch time, all workers sit together and eat. They also drink water from the same glass. An occasional worker may avoid drinking from the same glass immediately after a Harijan, but he would have no objection to drinking from the glass after some one else has used it.

Women workers are, however, different even though there are few Harijan women workers. Women eat separately and drink from their own glass. A worker remarked that once, while he was about to drink from a glass which was used by a Harijan, a woman from his caste caught his hand and stopped him. The conservative streak in women workers was tellingly brought out in the following remark by a socialist woman leader of long standing: "Leaders talk of equality among men irrespective of their caste. They say that once we die we are all the same. We do not know what happens after death. Right here, the Harijans beat drums when an upper caste man dies. But when there is a death in a Chakkiliar home, do we go and beat drums to announce the death?".

Harijans are found occupying important positions in the unions. The top position, of secretary in the Marxist union, is held by a Harijan. The treasurer of the Tamilnadu Trade Union Congress is a Harijan. Harijans are also found in the executive committees of union head offices, and at practically every level below. Many mill-level union branches are headed by Harijans. Harijans admit that union activists are by and large free from caste prejudices. This is especially true of socialist, communist, and DMK unions. A Harijan leader from the socialist union remarked: "Our leaders make absolutely no distinction. I can walk into my secretary's house any time. But the Harijan in the Congress union cannot do that. Why go that far? He cannot even visit his mill-level leader at his home. The DMK and Communist unions are comparable to ours."
